

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

No. 728.

SATURDAY, JANUARY 1, 1831.

PRICE 8d.

ADDRESS.

Upon entering our fifteenth year, after the experience the public has had of the *Literary Gazette*, and the unexampled approbation which has attended it, we need trumpet but very shortly on the space devoted to more useful purposes, by speaking of ourselves, as is a custom at the present season. Indeed, we have little to say, except to express a hope that our exertions to inform and please keep pace with the extraordinary encouragement we receive. Where every sheet exhibits a steadfast regard to truth and impartiality, it requires no puffing voice to proclaim our independence; nor would we allude to so trite a topic, had we not of late been made aware of an insidious effort, through some obscure and provincial papers, partly envious knaves and partly unreflecting dupes, to misrepresent our principles, motives, and line of conduct. And though these are contemptible enough, it is due even to the very few who might, by possibility, be misled by their quackery and falsehoods, to set the matter at rest.

The *Gazette* enjoys, by many thousands, the greatest circulation of any purely Literary Journal ever published in England; and it has risen to this gratifying eminence under the absolute control and direction of its Editor, who is also the proprietor of the largest proportion of the entire emoluments derived from this widely-extended sale. There may, it is true, be dishonourable persons engaged even in literary pursuits, who cannot be sensible to the better feelings which would prevent an individual so highly flattered by the approval of his labours, from degrading himself by subserviency to any interest whatever; but such persons must be able to appreciate fully the mercenary side of the inducement to persevere in so well-rewarded a course of uncompromising truth and undeviating integrity. Were we insensible to the nobler tie, and inclined to forfeit the good opinion of the number of illustrious and enlightened men whom we can estimate among our friends, as well as the partiality of the public at large; there is still enough in the desire to preserve us from backsliding: and we trust our provincial contemporaries, who have erroneously carped at us, will take a speedy opportunity of doing justice both to their own journals and to the *Literary Gazette*. For those, if such there be, who fancy that depreciating others is preferable to possessing merit of their own, we will venture to quote a passage from a *hazy Bay newspaper*. It is published among felons, to be sure; but it may therefore be the more applicable to those who are unconscious of gentlemanlike principles; and perhaps have some efficacy in dissuading them from the practice of filching away characters, and robbing good names.

"Confessors of newspapers," says our right-hearted friend in *New Holland*, "should have a higher idea of the very eminent and influential post they fill, than to descend to contaminate their columns with petty, contemptible squabbings. We are all, or ought to be, labouring in the search of truth, in the advancement of the public good, the pursuit of which has of itself a certain calming, a rectifying, a kind of soothing, self-gratulatory influence on the mind, because it brings with it the conviction that we are in the right path—that we are using the great engine which Providence has intrusted to our hand, to the best of our ability, for the benefit of our fellow-men. Let us, then, who are editors in these remote but truly interesting Australasian regions, unite in spurning all mean or selfish views, and strive in the noble and generous race of emulation, by exalting the character of

the periodical press of these colonies—by improving, not debasing, the minds of our readers!"

It would be a curious thing in the march of intellect, to send a cargo of English, Irish, and Scotch editors to Botany Bay, to learn honesty and manners, instead of slander and impudence, as conductors of the periodical press; but really, contrasting the above with what we see of some of them, we are sure it might be advantageous to the individuals, and would certainly be grateful to the community.

We have, however, bestowed too much notice on the paltry tribe; and can merely say, in apology, that our egotism offends only once a year.

From the first to the last, the *Literary Gazette* has zealously endeavoured to promote the just interests of the literature, sciences, and arts, of its native country: it has looked but to one quarter for its recompense; and, in addition to the delight experienced in having done its duty to the utmost, it has been amply satisfied by the meed of public applause, and by acquiring an influence which it will never abuse.

REVIEW OF NEW BOOKS.

Stapleton's Political Life of Mr. Canning.
3 vols. 8vo. Longman and Co.

WE could only give a hurried introduction of this invaluable work in our last No., and a brief extract, but yet of such great political importance, as fairly to exemplify the character of the publication. To us Canning was an idol, worshipped alike for the fascinations of his private life, and for the patriotism and purity of his public principles. We looked upon his advancement with an interest not to be described; and when we saw him placed at the head of the government, we felt that power was intrusted to a mind capable of appreciating the circumstances of the world, and to hands most fitted to shape the destinies of mankind, so as to ensure the prosperity and glory of England, and the welfare and happiness of all nations. Mr. Canning was deeply conscious of the spirit of the times, and of the grand, though as yet silent, struggle between ancient institutions and rising intelligence. Of all that was good in the former he was the intrepid defender; and of all that was beneficial in the latter he was the liberal advocate. Thus holding the balance like an enlightened statesman, our assurance was strong that, whatever occurred, our beloved minister would establish his country at the head of Europe—the foremost in the march of necessary reform, the firmest in the resistance of injurious innovation. And well did he know that, to prevent revolution, it was absolutely indispensable to take the lead in the new opinions, which had grown to such a degree and spread to such an extent throughout the civilised world, and by a masterly guidance, to direct that to the improvement, which, if opposed or misdirected, must turn to the bane of the human race. Had he lived, we should not have witnessed the scenes which have so lately convulsed, and still so fearfully agitate the continent; and every syllable which Mr. Stapleton relates serves but to confirm this mighty truth, and to shew how irreparable a

loss, not only Britain, but the whole earth, sustained, when George Canning was laid in his hallowed and immortal tomb.

We have much to regret that the author has not felt himself at liberty to enter upon the details of the negotiations which attended Mr. Canning's appointment to be First Lord of the Treasury and Chancellor of the Exchequer, when "the Duke of Wellington, Mr. Peel, and other anti-catholic members of Lord Liverpool's cabinet, resigned, and their places were temporarily supplied by the personal friends of Mr. Canning; it being settled that a portion of the Whig party were, at the end of the session, to form a part of the administration." These details, we can say, from matters of which we happen to be cognisant, are of the most intense interest; but Mr. S. tells us they "are omitted, in consequence of representations having been made to the author, that their publication at the present moment might be productive of very serious mischief to the country. The author cannot agree in this opinion; but in the existing crisis of affairs, it was not for him to take upon himself the responsibility of despising warnings of so grave a character, and of setting at nought the opinions of disinterested individuals, whose station and experience gave them a strong claim to consideration and respect. The author, therefore, on his own individual responsibility, withholds, for a short time, this portion of the history, in preference to delaying the whole work, and thereby incurring the hazard of losing, perhaps never to recover, the favourable opportunity which now offers for its publication."

We shewed, from Mr. Stapleton, in our last, that, soon after his decease, the foreign policy of Mr. Canning was departed from by his successors; and that, from their tone, the confidence of the people (we mean of the people universally) in the British councils was gradually weakened, and the conduct of the friends of more arbitrary rule began to assume a different form. In short, we were no longer wisely and discreetly at the head of liberal opinions; but were, on the contrary, suspected of being favourable to the opposite cause. This was a hideous misfortune, and has been, and will be,—unless Mr. Canning's system of policy can revive the same dispositions,—the cause of much misery, bloodshed, and war. Of the changes which developed themselves after Mr. Canning's death, by ministers who professed to adhere to his measures, we shall now, as shortly as the subject will admit, quote some of Mr. Stapleton's proofs. On the Catholic Question, he says:—

"It appears that Mr. Peel communicated his resolution to withdraw his opposition to the duke, very shortly after Mr. O'Connell's return; and, at the opening of the session of parliament in 1829, it was announced in the speech from the throne, that the ministers intended to bring forward concession as a government measure. The announcement of this intention was hailed with the loudest cheers by the old friends of emancipation; and it was

carried through both Houses of Parliament with little difficulty. Serious difficulties, indeed, could not be expected, after the Duke of Wellington and Mr. Peel, who had always been the main obstacles, in Mr. Canning's time, to the success of the measure, had ceased to be any obstacles whatever. But the task was, in truth, easy, for two reasons:—first, the anti-Catholic party had been completely disabled by the loss of its leaders, who had transferred all the weight of their own talents, and the influence of the government, to the Catholic party, which, even before the transfer, had been all but a match for its opponents. Secondly, the Whigs, who had a fair prospect of obtaining office, if the government were embarrassed on this question, gave it their most efficient support; and it must be admitted that the conduct of this party was truly patriotic, since they sacrificed office for the sake of principle. That the converse of this proposition is true of some of the members of the duke's government, cannot be affirmed. But there can be no doubt that one half would be correct—viz. that they sacrificed their principles.

"The point where the Duke of Wellington's government diverged from Mr. Canning's principles was, in not 'adopting a middle course between extremes,' and preferring to provoke by its opposition a state of things with which, when thus produced, it found itself unable to cope. Had the duke adhered to his former policy, his administration could not have stood a day after the meeting of parliament. The measure has been productive of very great advantages, and will yet be productive of far greater, both to Ireland and the whole British empire. If it has not already answered to the full extent which Mr. Canning had expected, it must be remembered, that before it was carried, affairs were brought by the Duke of Wellington to that state which it had been the anxious aim of Mr. Canning to avert."

"On the subject of finance, it must be observed, that from the speech which Mr. Canning made when bringing forward the budget in 1827, it was evident that he looked to the introduction of some decisive improvements in our financial system. It certainly was his intention to revise that system; and, doubtless, much might be done to improve the revenue and to lighten in a very considerable degree the pressure of the existing taxes. Such, unquestionably, was Mr. Canning's view of our situation; and if the Duke of Wellington's government has gone on in the old beaten path, contenting itself with simply providing for the exigencies of the current year, without looking beyond the moment for which it had to provide, then it cannot be said to have fulfilled Mr. Canning's intentions; and he therefore is in no way responsible for our present financial condition.

"It appears, therefore, upon the whole, that, in many of the most important questions of domestic policy, the Duke of Wellington's government have neither adhered to Mr. Canning's principles, nor carried his intentions into effect; and that, even with respect to the Catholic Question, there were many features connected with it calculated to diminish the advantages which Mr. Canning had contemplated, if it had passed without doing violence to the feelings of a large portion of the English public, and without producing a general distrust of the consistency of all public men. In turning from this brief consideration of our domestic affairs, we next come to that of the foreign policy of the Duke of Wellington.

This subject must be examined with reference both to the general 'system' of the duke as compared with that of Mr. Canning; and to the particular course pursued towards Portugal, Turkey, and Greece, the affairs of which countries remained in an unsettled state at the period of Mr. Canning's death."

We are sorry that our limits forbid our following the author into the whole of these important discussions. We come towards the conclusions:—

"If (says Mr. S.) the prevention of a 'material diminution of the power of Turkey' was the common object of Mr. Canning and the Duke of Wellington, it must be confessed that they respectively sought to attain it by the employment of very different means. Mr. Canning succeeded, and the duke failed: it must, however, be admitted, that the circumstances with which the duke had to contend were in a certain degree more difficult to control. It was undoubtedly an easier task to prevent the issue of such an *hatti shérif* as occasioned the war, than to get it recalled after it had been issued. It is, however, far from improbable, that had the duke's principles been sufficiently liberal to have enabled him to place upon the machinations of a certain continental government, in the case of Greece, a similar salutary restraint to that which Mr. Canning had before imposed in the case of Portugal, the sultan might have been induced to avert, by timely concession, the disgrace and ruin with which he has been overwhelmed. We next come to the affairs of Portugal, which are so intimately blended with the general system, that they cannot be discontinued. And here we would beg the reader to bear in mind the important and essential distinction between foreign and domestic policy. In the latter, almost every measure of an administration is known to the public: in the former, nearly all are necessarily for a time enveloped in mystery. Mr. Canning dissolved the Holy Alliance by the decided language which he held to their diplomatic agents; and that formidable union ceased to exist, without the public being able to perceive the means by which its dissolution was effected. The influence which a British foreign minister is enabled to exercise over the destinies of others, is of such magnitude, that upon it, accordingly as it is rightly or wrongly directed, the happiness or the misery of the world may depend. Had Mr. Canning been the enemy of constitutional freedom; had he wished to subvert Don Pedro's charter; had he perversely looked upon the Miguelites as the 'friends' of England; twice in the course of six months might he have aimed a fatal blow at that charter, without its being possible that any ill will on his part towards it could have been substantiated against him. Had the messenger who brought the news from Vienna, that Don Miguel had taken the oath, been delayed at Paris by Mr. Canning for twenty-four hours, under the pretence of charging him with despatches; or had less celerity and determination been manifested in sending troops to Portugal, Don Pedro's constitution would, in all probability, have been cast aside, in a shorter time after its arrival, than it eventually was after Mr. Canning's decease. These facts are only mentioned to shew, that even if a foreign secretary profess to be guided by certain principles, yet if he do not cordially adopt them, he may, without aught being able to be proved against him, give affairs such a turn as shall materially contravene their fair operation. Sound principles are not all that are required; a *bonâ fide* inclination to act in accordance with them is of no

less essential importance. Foreign policy is, and must be, a matter of confidence. Political good or evil are not the work of a single day, or the offspring of a single act. The effects of foreign policy are seldom perceived by the public until some months after the causes which have produced them have been put in operation, and, for the most part, not until the time when any inquiry into these causes is useless, except as affording the opportunity of holding them up to future statesmen, either for an example or a warning. Since, then, it is evident that great effects may be produced in foreign affairs, by means which may never come to the knowledge of the public, it is essential, in order to discover the real tendency of a course of policy, to ascertain the secret bias of those to whom the direction of it may be intrusted. This can only be done by a close examination of the nature of the known acts and declarations of its conductors."

To demonstrate this, Mr. Stapleton goes into the points quoted in our last *Gazette* (pp. 832, 833). After referring to the debates in parliament, he observes—

"Undoubtedly the preservation of peace was the object of Mr. Canning's policy; but it was not in the object, but in the means employed to secure it, that deviation was imputed. Mr. Canning's plan for preserving peace was to check the extravagancies of the two extreme parties. But from the praise of the Miguelites and the censure of the constitutionalists by Lord Aberdeen, it seems evident that the plan for the preservation of peace contemplated by himself and the Duke of Wellington, was to favour one extreme party, and to discountenance the other. In this, then, consisted the 'change'; and a more important or decisive change cannot well be imagined. Still it would seem that Lord Aberdeen, however well he might understand the principles of his own government, was unconsciously deviating from those of Mr. Canning, and that he neither comprehended their nature, nor was aware that they had ever been in operation; for, in the same speech in which the denial of deviation is to be found, he remarked, that he 'considered' the assertion that Mr. Canning had shaken off 'the trammels' of the Holy Alliance, 'as a mere figure of speech,' a 'tale of sound and fury, signifying nothing!' From the day on which this debate took place, till three days before the close of the session of 1829, the foreign policy of the Duke of Wellington was unimpeded by parliamentary discussion, the attention of the two Houses being almost exclusively engrossed with the settlement of the Catholic Question. Those, however, who watched the progress of our relations with Portugal, saw evident symptoms of the anti-liberal bias of the cabinet. Lord Beresford had been permitted to retain a high place in the government, at a time when he was accused of writing letters to Lisbon, expressive of an opinion that Don Miguel had a right to the throne, an accusation which was never refuted; the Portuguese refugees, in violation of every principle of international law, had been fired upon by a British commander, in the waters belonging to their own sovereign; and a special mission had been sent to Don Pedro to recommend him to give his daughter in marriage to Don Miguel, after this prince had perjured himself by becoming the usurper of her throne. It may be some excuse for this leaning towards Don Miguel, that Lord Aberdeen imagined that the party of his royal highness was more inclined towards British connexion than that of the constitutionalists. How com-

pletely he was mistaken has been amply illustrated by the treatment which British subjects have experienced at the hands of the usurping government. But it may be safely asserted, that had the feelings of the two parties in Portugal been in truth such as were supposed, Mr. Canning would never have departed from his general system of dealing out impartial justice to both sides. The notion, however, and its consequences, are a very striking comment upon the inveterate attachment of the British cabinet to arbitrary doctrines; since, in a case where the principles of legitimacy and absolute monarchy were arrayed against each other, legitimacy was sacrificed, and absolutism upheld."

We have nothing to add but our earnest prayer that the spirit of Mr. Canning may be freely infused into every government of England, and its existence, as their constant guide, be confessed by a confiding world, conscious of being thereby saved from anarchy and desolation.*

Letters and Journals of Lord Byron, with Notices of his Life. By Thomas Moore. Vol. II. 4to. London, 1830. Murray.

We feel inclined to divide our review into three heads, and consider, first, the biographer; secondly, the impression produced by the whole; thirdly, Lord Byron himself. Mr. Moore says, "May we not say, that, as knowledge is ever the parent of tolerance, the more insight we gain into the springs and motives of a man's actions, the peculiar circumstances in which he was placed, and the influences and temptations under which he acted, the more allowance we may be inclined to make for his errors, and the more approbation his virtues may extort from us?" Should it have been the effect of my humble labours to clear away some of those mists that hung round my friend, and shew him in most respects as worthy of love, as he was in all of admiration, then will the chief and sole aim of this work have been accomplished." First, let us set forth with doing full justice to the kindly and generous feeling which thus enlarges on the excellence, and defends all debatable points of a departed friend. It is easy to cavil and to correct; but we admire and respect the spirit which has made his task "a labour of love," however we may and do differ from many of his conclusions. Secondly, the work itself. It is equally interesting and entertaining; interesting, as an extraordinary mental picture; and entertaining, as replete with keen lively observations and amusing anecdotes. But has a quarto any privilege which it can plead, like a peer? or any peculiar immunity? if not, a considerable portion of these pages might have been omitted.

Whole lines of stars, some of which are liable to very awkward inferences; and divers passages, merely commemorative of the most com-

* If England does not place itself in the front for good, we fear there are others ready to do so for evil. From a late *Periodical Journal* (*Le Globe*), we observe that M. Jouffroy has succeeded M. Cousin in the chair of the history of Modern Philosophy; and the following is a portion of his first lecture. "To-day," he says, "the destinies of man and of humanity are agitated; they are represented by this country, which has always marched at the head of modern civilisation; so that if these destinies may be formed for France, they will be so for Europe, and for the world. I come to propose to you the moral problem of man, and to seek to resolve it as far as that is possible in a course of philosophy. There can be no religion to-day! That which distinguishes a religion is inspiration and crime forms. No religion is emancipated, and it can do without these forms." We would give more extracts; but these are sufficiently plain to shew the extent to which extreme sentiments are carried in the ancient and modern world. How many desperate characters, how many wrong and bad heads, are there in Europe, ready to start upon the fatal course thus recommended!

mon-place incidents, seem to us utterly unworthy of preservation. This fashion of asterisks is here carried to its excess, often very needlessly; so many of the names, such as Mad. de Stael, Lady Oxford, Sir Samuel Romilly, Lord and Lady Blessington, &c. &c. being easily filled up. Yet this is good for trade, for in a very few years the work will require a commentator. These remarks, however, are the exception, not the rule; for the great mass is full of attraction; though, we must say, we consider some of its details to be unfit for a large class of readers. We admit the kindness, but doubt the judgment, of that morality which deals in palliations. Thirdly, we must confess that our opinion of Lord Byron is rather lowered than raised. In the divers memoirs which have appeared, we have always leant towards the favourable side, on the ground that the self-love he had wounded was in array against him. But what can extenuate the gross, ungenerous, and bitter spirit in which almost all his letters are written? Is there a single friend who has escaped some malicious sneer? while his literary envy is petty to a degree. A strange mixture of good and ill seem to have been united in his nature: it would almost tempt us to believe in the old classic fable of two souls in one body. We recollect a remark in *Peilham*, (we are not quite sure— that, or *Devereux*), which says, "The wounds of our vanity make the secret of our pathos:" it was especially so in Byron's case. His vanity was that one marked feature which Moore says (untruthly, we think,) his character wanted. His vanity, like the sea, was boundless. Vain of his rank, his person, his talents; vanity is the "open sesame" to his mind. So glorious a gift as his genius, would have been too much for mortal, without some alloy.

Where this evil is not called into play, he is frank, kind, liberal, and affectionate. But vanity was the nightshade of his mind; it obscured, nay, eradicated, all his higher qualities. It equally stimulated his confidence and his reserve; for it is curious to remark how completely Lord Byron lived for the public: his letters are written more for the press than the post; and his every action has a reference to what will be said of it. To take one example among many, does it not explain his exclusive admiration of Pope? It enabled him to depreciate all his most popular rivals; and Pope, being dead, was out of the immediate line of competition. He was a Janus of the mind — one face of "earth, earthy;" the other, indeed, like that of an angel. We now turn to the work itself: much there is, we think, as already stated, that might most judiciously have been omitted. Take, for example, the following passages; and they are but two of many: speaking of an intrigue at Venice—

"I am very well off with Marianna, who is not at all a person to tire me; firstly, because I do not tire of a woman *personally*, but because they are generally bores in their disposition; and, secondly, because she is amiable, and has a tact which is not always the portion of the fair creation; and thirdly, she is very pretty; and, fourthly,—but there is no occasion for farther specification."

So far we have gone on very well; as to the future, I never anticipate, — *carpe diem* — the past at least is one's own, which is one reason for making sure of the present. So much for my proper *liaison*."

"It is the height of the carnival, and I am in the extreme and agonies of a new intrigue with I don't know exactly whom or what, ex-

cept that she is insatiate of love, and won't take money, and has light hair and blue eyes, which are not common here, and that I met her at the mask, and that when her mask is off I am as wise as ever. I shall make what I can of the remainder of my youth."

Having thus alluded to what we think objectionable, we proceed to what we think worthless: what is there in the following quotation to deserve publishing?—and yet this one extract is also the sample of many.

"Why have you not sent me an answer, and lists of subscribers to the translation of the Armenian *Eusebius*? of which I sent you printed copies of the prospectus (in French) two moons ago. Have you had the letter?—I shall send you another;—you must not neglect my Armenians. Tooth-powder, magnesia, tincture of myrrh, tooth-brushes, diabolon plaster, Peruvian bark, are my personal demands."

It is useless to prolong extracts of this kind, and we gladly advance to the great mass of interesting material which the book really contains. No new light is thrown on the subject of his matrimonial separation, except the following letter, which is, at least, very beautiful: it is addressed to Lady Byron.

"I have to acknowledge the receipt of 'Ada's hair,' which is very soft and pretty, and nearly as dark already as mine was at twelve years old, if I may judge from what I recollect of some in Augusta's possession, taken at that age. But it don't curl — perhaps from its being left grow. I also thank you for the inscription of the date and name, and I will tell you why;—I believe that they are the only two or three words of your hand-writing in my possession. For your letters I returned, and except the two words, or rather the one word, 'household,' written twice in an old account-book, I have no other. I burnt your last note, for two reasons:— firstly, it was written in a style not very agreeable; and, secondly, I wish to take your word without documents, which are the worldly resources of suspicious people. I suppose that this note will reach you somewhere about Ada's birthday — the 10th of December, I believe. She will then be six; so that in about twelve more I shall have some chance of meeting her; perhaps sooner, if I am obliged to go to England by business or otherwise. Recollect, however, one thing, either in distance or nearness;—every day which keeps us asunder should, after so long a period, rather soften our mutual feelings, which must always have one rallying-point as long as our child exists, which I presume we both hope will be long after either of her parents. The time which has elapsed since the separation has been considerably more than the whole brief period of our union, and the not much longer one of our prior acquaintance. We both made a bitter mistake; but now it is over, and irrevocably so. For, at thirty-three on my part, and a few years less on yours, though it is no very extended period of life, still it is one when the habits and thought are generally so formed as to admit of no modification; and as we could not agree when younger, we should with difficulty do so now. I say all this, because I own to you, that, notwithstanding every thing, I considered our re-union as not impossible for more than a year after the separation; but then I gave up the hope entirely and for ever. But this very impossibility of re-union seems to me at least a reason why, on all the few points of discussion which can arise between us, we

should preserve the courtesies of life, and as much of its kindness as people who are never to meet may preserve perhaps more easily than nearer connexions. For my own part, I am violent, but not malignant; for only fresh provocations can awaken my resentments. To you, who are colder and more concentrated, I would just hint, that you may sometimes mistake the depth of a cold anger for dignity, and a worse feeling for duty. I assure you, that I bear you *now* (whatever I may have done) no resentment whatever. Remember, that if you have injured me in aught, this forgiveness is something; and that, if I have injured you, it is something more still, if it be true, as the moralists say, that the most offending are the least forgiving. Whether the offence has been solely on my side, or reciprocal, or on yours chiefly, I have ceased to reflect upon any but two things,—viz. that you are the mother of my child, and that we shall never meet again. I think if you also consider the two corresponding points with reference to myself, it will be better for all three."

We will also subjoin Mr. Moore's own statement:

"The chief subject of our conversation, when alone, was his marriage, and the load of obloquy which it had brought upon him. He was most anxious to know the worst that had been alleged of his conduct; and as this was our first opportunity of speaking together on the subject, I did not hesitate to put his candour most searchingly to the proof, not only by enumerating the various charges I had heard brought against him by others, but by specifying such portions of these charges as I had been inclined to think not incredible myself. To all this he listened with patience, and answered with the most unhesitating frankness, laughing to scorn the tales of unmanly outrage related of him, but, at the same time, acknowledging that there had been in his conduct but too much to blame and regret, and stating one or two occasions, during his domestic life, when he had been irritated into letting 'the breath of bitter words' escape him;—words, rather those of the unquiet spirit that possessed him than his own, and which he now evidently remembered with a degree of remorse and pain which might well have entitled them to be forgotten by others. It was, at the same time, manifest, that whatever admissions he might be inclined to make respecting his own delinquencies, the inordinate measure of the punishment dealt out to him had sunk deeply into his mind, and, with the usual effect of such injustice, drove him also to be unjust himself;—so much so, indeed, as to impute to the quarter to which he now traced all his ill fate, a feeling of fixed hostility to himself, which would not rest, he thought, even at his grave, but continue to persecute his memory as it was now embittering his life. So strong was this impression upon him, that during one of our few intervals of seriousness, he conjured me, by our friendship, if, as he both felt and hoped, I should survive him, not to let unmerited censure settle upon his name, but, while I surrendered him up to condemnation where he deserved it, to vindicate him where aspersed. How groundless and wrongful were these apprehensions, the early death which he so often predicted and sighed for, has enabled us, unfortunately but too soon, to testify. So far from having to defend him against any such assailants, an unworthy voice or two, from persons more injurious as friends than as enemies, is all that I find raised in hostility to his name; while by none, I am

inclined to think, would a generous amnesty over his grave be more readily and cordially concurred in than by her, among whose numerous virtues, a forgiving charity towards himself was the only one to which she had not yet taught him to render justice."

We shall endeavour now to make our selection as miscellaneous as possible. His own confessions were given to Moore when he visited him in Italy.

"I found my noble host waiting to receive me, and, in passing with him through the hall, saw his little Allegra, who, with her nursery-maid, was standing there, as if just returned from a walk. To the perverse fancy he had for falsifying his own character, and even imputing to himself faults the most alien to his nature, I have already frequently adverted, and had, on this occasion, a striking instance of it. After I had spoken a little, in passing, to the child, and made some remark on its beauty, he said to me—'Have you any notion—but I suppose you have—of what they call the parental feeling? For myself, I have not the least.' And yet, when that child died, in a year or two afterwards, he who now uttered this artificial speech was so overwhelmed by the event, that those who were about him at the time actually trembled for his reason! A short time before dinner he left the room, and in a minute or two returned, carrying in his hand a white leather bag. 'Look here,' he said, holding it up—'this would be worth something to Murray, though you, I dare say, would not give sixpence for it.' 'What is it?' I asked. 'My Life and Adventures,' he answered. On hearing this, I raised my hands in a gesture of wonder. 'It is not a thing,' he continued, 'that can be published during my lifetime; but you may have it if you like—there, do whatever you please with it.' In taking the bag, and thanking him most warmly, I added, 'This will make a nice legacy for my little Tom, who shall astonish the latter days of the nineteenth century with it.' He then added, 'You may shew it to any of our friends you think worthy of it; and this is, nearly word for word, the whole of what passed between us on the subject.'"

"The Life is *Memoranda*, and not *Confessions*. I have left out all my *loves* (except in a general way), and many other of the most important things (because I must not compromise other people); so that it is like the play of Hamlet—the part of Hamlet omitted by particular desire.' But you will find many opinions, and some fun, with a detailed account of my marriage and its consequences, as true as a party concerned can make such account; for I suppose we are all prejudiced. I have never read over this Life since it was written, so that I know not exactly what it may repeat or contain. Moore and I passed some merry days together."

A fellow-feeling does not seem to have made him wondrous kind in the following instance:

"Of Madame de Staël, in that Memoir, he spoke thus: 'Madame de Staël was a good woman at heart, and the cleverest at bottom, but spoiled by a wish to be—she knew not what. In her own house she was amiable; in any other person's, you wished her gone, and in her own again.'"

"As to Madame de S*, I am by no means bound to be her beadsman; she was always more civil to me in person than during my absence. Our dear defunct friend, M* L*, who was too great a bore ever to lie, assured me, upon his tiresome word of honour, that, at Florence, the said Madame de S* was open-mouthed

against me; and when asked, in *Switzerland*, why she had changed her opinion, replied, with laudable sincerity, that I had named her in a sonnet with Voltaire, Rousseau, &c. &c., and that she could not help it, through decency. Now, I have not forgotten this; but I have been generous,—as mine acquaintance, the late Captain Whitby, of the navy, used to say to his seamen (when 'married to the gunner's daughter')—'two dozen, and let you off easy.' The 'two dozen' were with the cat-o'-nine-tails;—the 'let you off easy' was rather his own opinion than that of the patient."

The above asterisks of Madame de Staël and Monk Lewis seem to us very needless. We do not intend entering into the details of his connexion with the Countess Giuiccoli; and in giving place to what seems so touching and beautiful in the following little incident, we cannot but wonder to see it so immediately contrasted as it is by cold and sneering expressions. The letter was written in the countess's copy of Corinne.

"My dearest Teresa,—I have read this book in your garden;—my love, you were absent, or else I could not have read it. It is a favourite book of yours, and the writer was a friend of mine. You will not understand these English words, and others will not understand them,—which is the reason I have not scrawled them in Italian. But you will recognise the handwriting of him who passionately loved you, and you will divine that, over a book which was yours, he could only think of love. In that word, beautiful in all languages, but most so in yours—*Amor mio*—is comprised my existence here and hereafter. I feel I exist here, and I fear that I shall exist hereafter,—to what purpose you will decide; my destiny rests with you, and you are a woman, eighteen years of age, and two out of a convent. I wish that you had staid there, with all my heart,—or, at least, that I had never met you in your married state. But all this is too late. I love you, and you love me,—at least, you say so, and act as if you did so, which last is a great consolation in all events. But I more than love you, and cannot cease to love you. Think of me, sometimes, when the Alps and the ocean divide us;—but they never will, unless
BYRON.

Bologna, Aug. 25, 1819."

Speaking of the separation he had caused between the countess and her husband, he says:

"Your apprehensions (arising from Scott's) were unfounded. There are no *damages* in this country, but there will probably be a separation between them; as her family, which is a principal one, by its connexions, are very much against him, for the whole of his conduct; and he is old and obstinate, and she is young and a woman, determined to sacrifice every thing to her affections. I have given her the best advice, viz. to stay with him,—pointing out the state of a separated woman (for the priests won't let lovers live openly together, unless the husband sanctions it), and making the most exquisite moral reflections,—but to no purpose. She says, 'I will stay with him, if he will let you remain with me. It is hard that I should be the only woman in Romagna who is not to have her amico; but, if not, I will not live with him; and as for the consequences, love, &c. &c. &c.'—you know how females reason on such occasions. He says he has let it go on, till he can do so no longer. But he wants her to stay, and dismiss me; for he doesn't like to pay back her dowry and to make an alimony. Her relations are rather for the separation, as they detest him,—indeed, so does

every body. The populace and the women are, as usual, all for those who are in the wrong, viz. the lady and her lover. I should have retreated, but honour, and an erysipelas which has attacked her, prevent me,—to say nothing of love, for I love her most entirely, though not enough to persuade her to sacrifice every thing to a frenzy. 'I see how it will end; she will be the sixteenth Mrs. Shuffleton.'

Again, alluding to a party, whither he accompanies her.

"The G.'s object appeared to be to parade her foreign lover as much as possible, and, faith, if she seemed to glory in the scandal, it was not for me to be ashamed of it. Nobody seemed surprised;—all the women, on the contrary, were, as it were, delighted with the excellent example. The vice-legate, and all the other vices, were as polite as could be;—and I, who had acted on the reserve, was fairly obliged to take the lady under my arm, and look as much like a cicisbeo as I could on so short a notice."

We subjoin one or two chance bits, as we must give a few more extracts next week.

"In the mean time, Polidori had become jealous of the growing intimacy of his noble patron with Shelley; and the plan which he now understood them to have formed of making a tour of the Lake without him, completed his mortification. In the soreness of his feelings on this subject, he indulged in some intemperate remonstrances, which Lord Byron indignantly resented; and the usual bounds of courtesy being passed on both sides, the dismissal of Polidori appeared, even to himself, inevitable. With this prospect, which he considered nothing less than ruin, before his eyes, the poor young man was, it seems, on the point of committing that fatal act which, two or three years afterwards, he actually did perpetrate. Retiring to his own room, he had already drawn forth the poison from his medicine-chest, and was pausing to consider whether he should write a letter before he took it, when Lord Byron (without, however, the least suspicion of his intention), tapped at the door and entered, with his hand held forth in sign of reconciliation. The sudden revulsion was too much for poor Polidori, who burst into tears; and, in relating all the circumstances of the occurrence afterwards, he declared that nothing could exceed the gentle kindness of Lord Byron, in soothing his mind and restoring him to composure."

"A dialogue which Lord Byron himself used to mention as having taken place between them during their journey on the Rhine, is amusingly characteristic of both the persons concerned. 'After all,' said the physician, 'what is there you can do that I cannot?' 'Why, since you force me to say,' answered the other, 'I think there are three things I can do which you cannot.' Polidori defied him to name them. 'I can,' said Lord Byron, 'swim across that river—I can snuff out that candle with a pistol-shot, at the distance of twenty paces—and I have written a poem of which 14,000 copies were sold in one day.'"

"You seem to think that I could not have written the 'Vision,' &c. under the influence of low spirits; but I think there you err. A man's poetry is a distinct faculty, or soul, and has no more to do with the every-day individual than the inspiration with the Pythoness when removed from her tripod."

Songs. By the "Ettrick Shepherd." Now first collected. 12mo. pp. 311. Edinburgh, 1831, Blackwood; London, Cadell.

"Or such a man his country may be proud." This is an old-fashioned eulogy; not perhaps the worse for that; and yet it suits Hogg as exactly as if it had been invented expressly on his account. Of such a man his country may be proud. We respect and we admire him. We respect the energy that has made its own way,—the industry that has done the best with materials within its power. We admire the genius which has added to our literature so much of its better part—simple, touching, and beautiful poetry. Hogg has just translated the fine old airs of his country into words. A strong feeling has gone straight from his heart to his song; and nothing can be more real than his sorrow, unless it be his mirth. He is the poet of actual emotions. To use a simile—fit fashion of reviewing poetry—he is like one of his own mountain rivulets gushing forth in music and sunshine, melody and merriment—tender, yet joyous. Moreover, there is a quaint sturdiness about him, which is something between the independent man and the spoilt child. The running commentary on his own songs is one of the most amusing and original things we remember to have read. We shall begin with a few of these prefaces.

"Donald M'Donald."—I place this song the first, not on account of any intrinsic merit that it possesses—for there it ranks rather low—but merely because it was my first song, and exceedingly popular when it first appeared. I wrote it when a barefooted lad herding lambs on the Blackhouse Heights, in utter indignation at the threatened invasion from France. But after it had run through the three kingdoms, like fire set to heather, for ten or twelve years, no one ever knew or inquired who was the author."

He hears in a theatre a singer substitute a last verse of his own for the original one.

"It took exceedingly well, and was three times encored; and there was I sitting in the gallery, applauding as much as any body. My vanity prompted me to tell a jolly Yorkshire manufacturer that night, that I was the author of the song. He laughed excessively at my assumption, and told the landlady that he took me for a half-crazed Scots pedlar. Another anecdote concerning this song I may mention; and I do it with no little pride, as it is a proof of the popularity of Donald M'Donald among a class, to inspire whom with devotion to the cause of their country was at the time a matter of no little consequence. Happening upon one occasion to be in a wood in Dumfries-shire, through which wood the high-road passed, I heard a voice singing; and a turn of the road soon brought in sight a soldier, who seemed to be either travelling home upon furlough, or returning to his regiment. When the singer approached nearer, I distinguished the notes of my own song of Donald M'Donald. As the lad proceeded with his song, he got more and more into the spirit of the thing, and on coming to the end,

'An' up wi' the bonny blue bonnet,
The kilt an' the feather an' a'!

in the height of his enthusiasm, he hoisted his cap on the end of his staff, and danced it about triumphantly. I stood ensconced behind a tree, and heard and saw all without being observed."

The "Skylark" he calls "a little pastoral song, worth half-a-dozen of the foregoing;" we agree with him.

"The Broom sae green" is my greatest

favourite at present,—probably because the air is my own, as well as the verses; for I find I have a particular facility in approving of such things."

The next is very characteristic:—

"The Women Fo'k."—The air of this song is my own. It was first set to music by Heather, and most beautifully set too. It was afterwards set by Dewar, whether with the same accompaniments or not, I have forgot. It is my own favourite humorous song, when forced to sing by ladies against my will, which too frequently happens; and, notwithstanding my wood-notes wild, it will never be sung by any so well again."

We think the Shepherd's resentment burns in the wrong quarter in the following note:

"The Maid of the Sea" is one of the many songs which Moore caused me to cancel, for nothing that I know of, but because they ran counter to his. It is quite natural and reasonable that an author should claim a copyright of a sentiment; but it never struck me that it could be so exclusively his, as that another had not a right to contradict it. This, however, seems to be the case in the London law; for true it is that my songs were cancelled, and the public may now judge on what grounds, by comparing them with Mr. Moore's. I have neither forgot nor forgiven it; and I have a great mind to force him to cancel Lalla Rookh for stealing it wholly from the Queen's Wake, which is so apparent in the plan, that every London judge will give it in my favour, although he ventured only on the character of one accomplished bard, and I on seventeen. He had better have let my few trivial songs alone."

We apprehend Mr. Moore had nothing to do with it: the question was one of musical copyright.

Like most poets, he has a fair hit at the *Edinburgh Review*.

"Donald M'Gillavry" was originally published in the Jacobite Relics, without any notice of its being an original composition; an omission which entrapped the *Edinburgh Review* into a high but unintentional compliment to the author. After reviewing the Relics in a style of most determined animosity, and protesting, over and over again, that I was devoid of all taste and discrimination, the tirade concluded in these terms: 'That we may not close this article without a specimen of the good songs which the book contains, we shall select the one which, for sly, characteristic Scotch humour, seems to us the best, though we doubt if any of our English readers will relish it.' The opportunity of retaliating upon the reviewer's want of sagacity was too tempting to be lost; and the authorship of the song was immediately avowed in a letter to the Editor of Blackwood's Magazine. 'After all,' said this avowal, 'between ourselves, Donald M'Gillavry, which he has selected as the best specimen of the true old Jacobite song, and as remarkably above its fellows for 'sly, characteristic Scotch humour,' is no other than a trifle of my own, which I put in to fill up a page!' I cannot help remarking here, that the *Edinburgh Review* seems to be at fault in a melancholy manner, whenever it comes to speak of Scottish songs. My friend Mr. William Laidlaw's song, of Lucy's Flitting, appeared first in the Forest Minstrel, and immediately became popular throughout Scotland. It was inserted in every future selection of Scottish songs, and of course found a place in Allan Cunningham's collection. Here it is to be supposed the *Edinburgh reviewer* saw and

heard of it for the first time; and, with some words of praise, he most condescendingly introduced it to public notice, after it had been sung and appreciated from the cottage to the palace, for a space of nearly twenty years. This reminds me of an old gentleman, who, as he said, 'always liked to have people known to each other;' so one day he made a party, for the purpose of introducing two cousins, who had been brought up under the same roof. The company took the matter with gravity, and the joke passed off very well at the old gentleman's expense."

The next notes are very amusing.

"O'er the Ocean bounding," is another of the proscription list; but here, let them turn the blue bonnet wha can. Our forefathers had *cried down* songs, which all men and women were strictly prohibited from singing, such as 'O'er Boggie,' and 'The wee Cock Chicken,' &c., because Auld Nick was a proficient at playing them on the pipes. The London people have done the same with a number of mine; but I hereby cry them up again, and request every good singer in Britain and Ireland, and the East Indies, to sing the following song with full berr to the sweet air, 'Maid of the valley.'"

"Mary, canst thou leave me?" Is finely set by Bishop to a melody of my own. I cannot aver that it is thoroughly my own; but if it is not, I know not where I heard it. But it is of no avail: since I think it is mine, it is equally the same as if it were so."

"O, weel bafa' the Maiden gay." This song was written at Ellery, Mr. Wilson's seat in Westmoreland, where a number of my very best things were written. There was a system of competition went on there, the most delightful that I ever engaged in. Mr. Wilson and I had a Queen's Wake every wet day—a fair set-40 who should write the best poem between breakfast and dinner; and if I am any judge, these friendly competitions produced several of our best poems, if not the best ever written on the same subjects before. Mr. Wilson, as well as Southey and Wordsworth, had all of them a way of singing out their poetry in a loud sonorous key, which was very impressive, but very ludicrous. Wilson at that period composed all his poetry, by going over it in that sounding strain; and in our daily competitions, although our rooms were not immediately adjoining, I always overheard what progress he was making. When he came upon any grand idea, he opened upon it full swell, with all the energy of a fine fox-hound on a hot trail. If I heard many of these vehement aspirations, they weakened my hands and discouraged my heart, and I often said to myself, 'Gudefaith, it's a' ower wi' me for this day!' When we went over the poems together in the evening, I was always anxious to learn what parts of the poem had excited the sublime breathings which I had heard at a distance, but he never could tell me. There was another symptom. When we met at dinner-time, if Mr. Wilson had not been successful in pleasing himself, he was desperate sulky for a while, though he never once missed brightening up, and making the most of the subject. I never saw better sport than we had in comparing these poems. How manfully each stood out for the merits of his own! But Mrs. Wilson generally leaned to my side, nominally at least. I wrote the 'Ode to Superstition' there, which, to give Mr. Wilson justice, he approved of most unequivocally. He wrote 'The Ship of the Desert' against it—a thing of far greater splendour, but exceedingly extravagant."

"I'll no wake wi' Annie.' I composed this pastoral ballad, as well as the air to which it is sung, whilst sailing one lovely day on St. Mary's Loch; a pastime in which, above all others, I delighted, and of which I am now most shamefully deprived. Lord Napier never did so cruel a thing, not even on the high seas, as the interdicting of me from sailing on that beloved lake, which if I have not rendered classical, has not been my blame. But the credit will be his own,—that is some comfort."

"The Moon was a-waning" is one of the songs of my youth, written long ere I threw aside the shepherd's plaid, and took farewell of my trusty colley, for the bard's perilous and thankless occupation. I was a poor shepherd half a century ago, and I have never got farther to this day; but my friends would be far from regretting this, if they knew the joy of spirit that has been mine. This was the first song of mine I ever heard sung at the piano, and my feelings of exultation are not to be conceived by men of sordid dispositions. I had often heard my strains chanted from the ewe-bought and the milking green, with delight; but I now found that I had got a step higher, and thenceforward resolved to cling to my harp, with a fondness which no obloquy should diminish,—and I have kept the resolution."

If ever novels shewed "man as he is," these entertaining snatches speak Hogg himself. We have given the prose preference, because of its novelty. We now turn to the poetry: let the following songs speak for themselves. To those who do not like them, we say, shew us their equals in lyric poetry: or let them do what will be far better, turn to the volume itself and choose other favourites.

The Broken Heart.

"Now lock my chamber-door, father,
And say you left me sleeping;
But never tell my step-mother
Of all this bitter weeping.
No earthly sleep can ease my smart,
Or even a while relieve it;
For there's a pang at my young heart
That never more can leave it!
O, let me lie and weep my fill
O'er wounds that heal can never;
And O, kind Heaven! were it thy will,
To close these eyes for ever!
For how can maid's affections dear
Recall her love mistaken?
Or how can heart of maiden bear
To know that heart forsaken?
O, why should vows so fondly made
Be broken ere the morrow,
To one who loved as never maid
Loved in this world of sorrow?
The look of scorn I cannot brave,
Nor pity's eye more dreary;
A quiet sleep within the grave
Is all for which I weary!"

The following is very playful.

"When Maggy gangs awa'."

"O what will a' the lads do
When Maggy gangs awa'?
O what will a' the lads do
When Maggy gangs awa'?
There's no a' heart in a' the glen
That dains dread the day.
O what will a' the lads do
When Maggy gangs awa'?
Young Jock has ta'en the hill for't—
A waeft' wight is he;
Poor Harry's ta'en the bed for't,
And laid him down to tee;
An' Sandy's gane unto the kirk,
And learning fast to pray.
And, O, what will the lads do
When Maggy gangs awa'?
The young laird o' the Lang-Shaw
Has drunk her health in wine;
The priest has said—in confidence—
The lassie was divine—
And that is mair in maiden's praise
Than any priest should say;
But, O, what will the lads do
When Maggy gangs awa'?
The walling in our green glen
That day will quaver high,

"Twill draw the redbreast frae the wood,
The laverock frae the sky;
The fairies frae their beds o' dew
Will rise and join the lay;
An' hey! what a day will be
When Maggy gangs awa'!"

We have only room for one verse of a very sweet song.

Love Letter.

"I downa bide to see the moon
Blink o'er the hill sae dearly,
Late on a bonny face she shone,
A face that I loe dearly.
An' when down by the water clear
At e'en I'm lonely roaming,
I sigh, an' think if aye were here,
How sweet wad fa' the gloaming."

The Skylark.

"Bird of the wilderness,
Blithesome and cumberless,
Sweet be thy matin o'er moorland and lea!
Emblem of happiness,
Blest is thy dwelling-place—
O to abide in the desert with thee!
Wild is thy lay and loud,
Far in the downy cloud,
Love gives it energy, love gave it birth.
Where, on thy dewy wing,
Where art thou journeying?
Thy lay is in heaven, thy love is on earth.
O'er fell and fountain sheen,
O'er moor and mountain green,
O'er the red streamer that heralds the day,
Over the cloudlet dim,
Over the rainbow's rim,
Musical cherub, soar, singing, away!
Then, when the gloaming comes,
Low in the heather blooms
Sweet will thy welcome and bed of love be!
Emblem of happiness,
Blest is thy dwelling-place—
O to abide in the desert with thee!"

He says himself—

"Oft has the lark sung o'er my head,
And shook the dew-drops frae his wing."

It was a good lesson to a poet, and Mr. Hogg has learnt it by heart. Among the other songs we like best, but which we have not space to quote, we would point attention to "The Broom sae green;" "When the Kye comes Hame;" "Lenachan's Farewell;" "The Poor Man;" "Liddell Bower." But even a longer list than this would end with &c. &c. This volume will greatly raise the poet in the estimation of England, which is too apt to mistake him for a Noctesarian roisterer, and, though an imaginative, a sometimes coarse prose writer.

The National Library, Vol. V.—Festivals, Games, and Amusements, ancient and modern. By Horatio Smith, Esq. Pp. 382. Colburn and Bentley.

WHAT could be done in one small volume for a range of subjects so extensive as is here embraced, has been done by Mr. Smith. We are free to say, that had we devised the work, we should have devoted at least a space as large to ancient, and another to British festivals, &c.; but we must speak of the design as we find it, and, in this point of view, speak highly of its merits as an epitome of popular information. The lateness of the hour at which we received it, and the pressure of other novelties,—and indeed we might add, the nature of the subjects, so long the favourites of antiquarian research,—prevent us from going into detail; and we shall extract but a few brief passages as examples of the author. For the first, what can be so fitting in this Gazette as *New Year's Day*?

"It is at once so natural and so laudable to commemorate the nativity of the new year, which is a sort of second birthday of our own, by acts of grateful worship to Heaven, and of beneficence towards our fellow-creatures, that this mode of its celebration will be found to have prevailed, with little variety of observance, among all ages and people. Congratulations, visits, and presents of figs and dates, covered with gold-leaf, are said to have distinguished

New Year's Day even in the times of Romulus and Tatius, and to have continued under the Roman emperors, until the practice, being abused into a mode of extortion, was prohibited by Claudius. Yet the Christian emperors still received them, although they were condemned by ecclesiastical councils on account of the pagan ceremonies at their presentation; so difficult was it found, in the earlier ages of Christianity, to detach the newly-converted people from their old observances. The Druids of ancient Britain were accustomed on certain days to cut the sacred mistletoe with a golden knife, in a forest dedicated to the gods, and to distribute its branches with much ceremony as new year's gifts to the people. Among the Saxons and northern nations this anniversary was also observed by gifts, accompanied with such extraordinary festivity, that they reckoned their age by the number of these merry makings at which they had been present. The Roman practice of interchanging presents, and of giving them to servants, remained in force during the middle and later ages, especially among our kings and nobility, Henry III. appearing to have even imitated some of the Roman emperors by extorting them, and Queen Elizabeth being accused of principally supporting her wardrobe and jewellery by levying similar contributions. Pins were acceptable new year's gifts to the ladies, as substitutes for the wooden skewers, which they used till the end of the fifteenth century. Instead of this present they sometimes received a composition in money, whence the allowance for their separate use is still termed 'pin-money.' To the credit of the kindly and amiable feelings of the French, they bear the palm from all other nations in the extent and costliness of their new year's gifts. It has been estimated that the amount expended upon *bon-bons* and sweetmeats alone, for presents on New Year's Day in Paris, exceeds 20,000*l.* sterling; * while the sale of jewellery and fancy articles in the first week in the year is computed at one-fourth of the sale during the twelve months. It is by no means uncommon for a Parisian of 8000 or 10,000 francs a-year to make presents on New Year's Day which cost him a fifteenth part of his income. At an early hour of the morning this interchange of visits and *bon-bons* is already in full activity, the nearest relations being first visited, until the furthest in blood and their friends and acquaintances have all had their calls. A dinner is given by some member of the family to all the rest, and the evening concludes, like Christmas Day, with cards, dancing, or other amusements. In London, New Year's Day is not observed by any public festivity; the only open demonstration of joy is the ringing of merry peals from the belfries of the numerous steeples late on the eve of the old year, until the chimes of the clock have sounded its last hour. We may have done well to drop what Prynne, in his *Histrio-Mastix*, calls 'a meere relique of paganism and idolatry, derived from the heathen Romans' feast of two-faced Janus, which was spent in mummeries, stage-plays, dancing, and such like interludes, wherein fidlers and others acted lascivious effeminate parts, and went about the towns and cities in women's apparel;' but, however the celebration of New Year's Day may have been disfigured in the earlier ages by pagan associations and superstitious rites, nothing can be more truly Christian than to usher it in with every cheerful observance that may express gratitude towards Heaven, and promote

a kindly and a social feeling among our friends and fellow-creatures."

In his introductory chapter, Mr. Smith says: "By comparing the world, as it then existed, with the happiness and widely diffused civilisation with which it is now blessed, and above all, by contrasting the hourly-improving intellectual eminence of the living generation with the ignorant barbarism of the early ages, we may form some conception, though probably but a dim one, of the glorious destiny which a beneficent Providence has reserved for mankind even in our present sphere." We trust there is not too much of poetical colouring in this; but, in truth, we question if the most barbarous ages could shew such scenes of horror and bloodshed as we have witnessed during the last (enlightened!) half-century, and of which we have too much cause, at this day, to dread the repetition. Nay, we will go farther, and, though the schoolmaster is boasted to be abroad, we will assert, that ignorance, and superstition, and fraud, are as grossly and mischievously prevalent in our own times as at any former period of the world's history that can be mentioned. However, it is the fashion of every epoch to have its optimists; and golden, or at least golden-promising, ages belong to every generation for the last two thousand years, and historical darkness is the only reason why we do not trace them from the flood.

"When mankind," continues the author, "had partially advanced to the agricultural state, we find that their most distinguished heroes and demigods were sportsmen and hunters, whose exploits, although subsequently dressed up in fable by the poets, had, doubtless, in most instances, a basis of fact. Every nation has its Nimrod; nor need we doubt that there must have been some foundation for the marvellous adventures recorded of Orion, Apollo, Hercules, and other monster-destroyers, if we recollect that the fossil remains of those gigantic quadrupeds, the mammoth and the megalonix, establish the fact, that the earth was formerly infested with terrible animals, whose races have now become extinct, and whose existence was once deemed as fabulous as we now deem the legendary labours of Hercules."

We doubt this inference; for the animals mentioned were *ante-diluvian*, and the legends *post*; and besides, they were more remarkable for bulk than ferocity, if we may judge by their remains, which indicate their food to have been branches of trees and herbage, not carneous. Proceeding, Mr. Smith observes, "It must be confessed, that in England they still retain many traits of barbarism, which have long since fallen into desuetude with our more polished neighbours of the continent; but at the same time it should be remembered that the Corinthian classes, who in the days of Queen Elizabeth flocked to bull, bear, badger, ape baitings, and other exhibitions equally cruel and ruffianly, would be now held utterly disgraced, at least in the estimation of real gentlemen, by participating in such low-lived sports. The charms of music, of the drama, of literature, of social meetings that combine 'the feast of reason with the flow of soul;' all those pursuits, in short, wherein the pleasures of sense are made subservient to the gratifications of the mind—these are the amusements alone worthy of rational people, and these receive the especial patronage of the English gentry."

And here, again, we have to express our hope that the writer may not be too partial to his country and contemporaries. There is, we believe, grounds for his conclusion; but to be an entirely just picture, pugilistic combats for

money in the ring, the cockpit with its rat-killing exhibitions, and sundry other polite recreations, must be abandoned.

After discussing Greek and Roman games, we find at page 108, an historical retrospect as a preface to the chapters on modern festivals and amusements. This is the most original and most carefully written portion of the work, and contains some excellent reflections. We quote a few passages.

"After the wars of the parliament, when the pleasure-hating puritans gained the ascendancy, the pastimes of all classes, but more especially of the lower orders, suffered a miserable suspension and abridgment. Austerity and mortification were enforced by those morose ascetics with a blind rigour that confounded the most innocent recreations with others of which the suppression, or at least the regulation, might perhaps have been desirable. Not only were the theatres and public gardens closed, but a war of bigotry was carried on against May-poles, wakes, fairs, organs, fiddles, dancing, Whitsun-ales, puppet-shows, and almost every thing else that wore the semblance of popular amusement and diversion. The recoil of the national mind, thus forcibly wrested from its natural bias, occasioned that burst of licentiousness and general demoralisation which disgraced the return and the reign of Charles II.; a warning that ought not to be forgotten by the modern puritans, who would restrict the harmless pastimes of our labouring classes."

"From the time of the Revolution there has been an increasing tendency to compel a rigorous observance of the sabbath, until in the present days it begins to savour strongly of puritan bigotry and intolerance. Deeply as we respect the motives of the good and pious men who would restrict the bulk of the people from all recreations, however innocent, on the only day when they can enjoy them, we still presume to think that they may push this austerity too far. If our universal Father and Creator delights, as he unquestionably must do, in the happiness of his creatures, what can be more acceptable to him than the sight of those innocent enjoyment in which they may indulge after the performance of public worship?—what devotion so pure and ardent as the harmless exhilaration of a grateful heart? 'Cheerfulness,' says Addison, 'is the best hymn to the Divinity.' Even Dr. Watts admits that 'religion never was designed to make our pleasures less;' and if this be true, why should we object, after performance of the stated worship, to any recreation, any amusement whatever, provided always that it be of an unobjectionable nature? It is high time, even for the sake of religion herself, to shake off those pharisaical austerities which, in the minds of the vulgar, tend to associate her with gloom, sadness, mortification, and *ennui*. The great demoralisation of the age has not unfrequently been attributed to sabbath-breaking, in which offence are included the after-church water-parties of the poor cooped-up Londoners, who, on this only day of relaxation, crowd to Richmond to walk in the meadows, and admire the beautiful scenery. Surely this is a lamentable mistake! An habitual disregard of its enjoined observances, and a desecration of the sabbath by dissolute indulgences, may doubtless lead to all sorts of immorality and vice; but such profanation is not the prevailing characteristic of the lower classes in England. On the contrary, there is perhaps no country in the world where the Sunday is in general more rigorously observed; and, un-

* We are afraid it will fall far short this year.—*Ed. L. G.*

fortunately, there are few which stand so low in the scale of morality, when compared with other nations. For many centuries the sabbath afternoon was appropriated, in our own country, to all sorts of sports and pastimes, as it still continues to be throughout the greater part of modern Christendom. If we weigh present England, as to morality, crimes, and misdemeanors, either with her former self, or her modern neighbours, shall we find that the severity and gloom of her sabbaths have afforded an increased security against crime? Alas! we fear not. May there not even be a suspicion that by denying open and innocent recreations to the people on their sole holiday, we have driven them into alehouses and other covert haunts of vice, and thus aided the demoralisation we were seeking to prevent? Upon this question we decide nothing; but it is one that deserves the most serious consideration. Let all the religious services of the sabbath be duly attended; but let us not violate the cheerful sanctity of its spirit, either by an excess of rigour or of riot. He who, instead of observing its ordinances, habitually abandons himself to profligate indulgences, is a sabbath-breaker; so is he who dedicates the Lord's day to the worship of his own narrow notions, for this is self-idolatry; who saddens it by misery and moroseness, for this is ingratitude towards Heaven; who embitters it with bigotry and intolerance, for this is uncharitableness towards his fellow-creatures."

These extracts so truly echo our sentiments, that we cannot but earnestly recommend them to attention. By restraining the poorer classes from innocent sports and enjoyments, instead of providing them with both, to the utmost convenient limit, they have been dissociated and driven into the worst habits. The secret dram is the substitute for the forbidden holiday; moroseness and dissatisfaction the natural feeling of classes who partake not in the recreations of their fellow-creatures. The system is abhorrent to sense; and when we consider, how easy it would be to make a people comparatively happy and contented, by very slight endeavours to furnish them with suitable pastimes, we are astonished at the moral and political blindness which postpones the attempt. But our thoughts are all upon the quantity of labour that may be extracted, and the small proportion of food that may sustain nature, and the accursed calculations of self-interest and commerce; by these means are misguided and suffering peasants made rebels and incendiaries. Restore to them, with even hard living and privations, some of the pleasant games and delights of their forefathers, and you will do more to render them good subjects than by employing all the schemes ever devised by all the schools of political economy.

The Vizier's Son; or, the Adventures of a Mogul. By the Author of "Pandurang Hari." 3 vols. 12mo. London, 1831. Saunders and Otley.

A PICTURESQUE and spirited sketch of eastern manners and history, embodied in the popular form of narrative. The story of the *Vizier's Son* begins better than it ends; the dénouement is unsatisfactory. We think the fault rests in the author's plan, which is not good: two or three other tales are woven into the principal one, without any connexion, and the main events are kept out of sight till they are nearly forgotten. In fiction, as in fact, delays are dangerous. The stories are well told themselves, but they had far better have succeeded

one another, than have been introduced. The following is a scene for the *Arabian Nights*.

"Fronting the grand entrance-gate which supports this Nigarrah Khaneh, and crossing the court-yard, is a large and magnificent hall, supported by several rows of pillars, all painted and overlaid with gold. This hall is raised and very airy, being open on three sides, which look into the court-yard. In the centre of the wall dividing the private apartments of the palace, and about eight feet from the ground, is a wide and spacious opening, where the king regularly takes his seat at noon, surrounded by his four sons, Dara, Aurungzebe, Sultan Sujah, and Morad Bakee; whilst eunuchs, placed around the sacred person of his majesty, agitate the air with large fans, and flap away the flies and musquitos with peacocks' tails and chouries of the finest hair. Beneath this throne stand the omrahs, rajahs, and ambassadors, their eyes bent upon the earth, and their hands crossed upon their breasts. The remainder of the hall, and the whole court-yard, are filled with persons of all ranks, high and low, rich and poor; this hall being expressly for the indiscriminate attention of his majesty to all his subjects.

The court-yard being now quite clear, and the royal horses having been paraded before the king, the elephants, with slow and solemn steps, advanced, having their hides washed and cleaned, and their trunks carefully painted red, whilst strings of silver bells jingled around their necks. When immediately in front of his majesty, the mahowuts on the necks of the animals, caused them (by the application of the ankoo or goad with which they control them), to raise their trunks and roar aloud, which is considered as the elephant's method of performing the tuslim or usual reverence. Succeeding the elephants came antelopes, nilgaus, rhinoceroses, and buffaloes with immense horns, provided by nature to enable them to contend against lions, tigers, &c. After these appeared panthers and hunting leopards, cranes, hawks, and sporting dogs."

The young officer advances.

"By the twelve imaams, my friend, I will wager there is not a better blade in the assembly than the one at my side, and I will either prove its value and the strength of my own arm, or never again appear before the king." I unsheathed my cimeter, and as I did so, caught the approving look of my father. A carcass being thrown in the centre of the court-yard, several mansebdars and young omrahs advanced to try their polished blades, and amongst the foremost came Yusuf, the nephew of Burkandaz Khan, his countenance illumined by anticipated success; but the blow, struck with more strength than judgment, snapped in two his shining blade, and he retired abashed and mortified, quailing beneath the frown of his haughty uncle. I now advanced, and flourishing my sword fantastically over my head, with a back-handed blow divided the carcass of the sheep; and although my weapon trembled from the point to the very hilt, it was neither bent nor even notched by the stroke. Pleased with my achievement, I cried aloud, 'May I ever be successful over the king's enemies.'"

Besides amusement, a clear and historical idea may be formed of Hindoo events and customs from these volumes.

The British Farmer's (Quarterly) Magazine. Ridgway. London.

WE have before us the fourth volume of this very useful work, just completed. Besides every thing of importance occurring in the agri-

cultural world, such as general and provincial reports, markets, &c. it contains much original matter, peculiarly interesting to farmers, and to all engaged in the improvement of landed property. Whatever tends to advance the knowledge of rural economy is recorded, and all novelties in the practice of agriculture are brought into view. To the best systems of British cultivation, are added all that is worthy of imitation among continental and American farmers; and the methods in which they excel are recommended. One conspicuous feature of the Magazine, is the valuable instructions given for the improvement of the various breeds of live stock, communicated by some of the most eminent breeders in the kingdom, illustrated by well-executed engravings of superior and celebrated animals. It also contains a great body of agricultural and commercial statistics, which clearly shew how far agriculture has been, and continues to be, affected by legislative interference, and the change of times: pointing out the causes of the distresses which are unfortunately still in existence, with their remedies propounded. New books, treating on subjects of rural improvement, and for bettering the condition of the rural population, we observe, are noticed at considerable length. In short, it forms a useful register, and a respectable medium for the discussion of practical, as well as scientific agriculture, of which grand source of national employment and wealth, it is professedly a guide and a guard. A subject of increasing interest is promised in the future numbers, viz. the introduction of the various prize essays of the Manchester Agricultural Society.

The Family Library, Vol. XVIII. Voyages, &c. of the Companion of Columbus. By Washington Irving. 12mo. pp. 327. London, 1831. Murray.

THIS is a delightful volume; for the preface truly says, that the expeditions narrated and springing out of the voyages of Columbus may be compared to the attempts of adventurous knights-errant to achieve the enterprise left unfinished by some illustrious predecessors. Washington Irving's name is a pledge how well their stories will be told: and we only regret that we must of necessity defer our extracts for a week.

The Cabinet Cyclopædia, Vol. XIV. A Preliminary Discourse on the Study of Natural Philosophy. By J. F. W. Herschel, Esq., M.A. 12mo. pp. 372. London, 1831. Longman and Co.

ANOTHER of our monthly friends, and, we regret to say, so late in greeting our eyes, that we can only speak of it generally as a very high and important contribution to our national stock of scientific knowledge. As far as it goes, it is a perfect manual of the fundamental principles of physics.

Youth's Keepsake; a Christmas and New-Year's Gift for Young People. Boston, 1831, Carter and Hendee: London, O. Rich.

A MOST delightful little volume. Our young neighbours across the Atlantic will, we think, be well inclined to follow the advice of the motto, and

"Keep it for the giver's sake,
And read it for their own."

There is a rich spirit of poetry in the tales, and a fine perception of the natural and beautiful, which shew that no ordinary run of talent has catered for the youthful reader's en-

joyment. We have not space for extract this week, so content ourselves with particularly mentioning N. P. Willis, Mrs. Child, and the anonymous authors of "Robert Turner," "Julia's Birthday," and the "Fairy Tree."

The Poetical Works of William Couper. In 2 vols. London, 1830. W. Pickering.

WHEN we say these volumes (the Aldine Edition of the Poets,) go on as they have begun, we give them the highest possible praise. As in republishing works considered standard in literature, the efforts of the bookseller are more matter of criticism than those of the author, whose fame is supposed to be established, we beg to refer the readers to a very just compliment paid Mr. Pickering, in the life here prefixed. Such an edition does equal credit to the taste and industry of its publisher. A memoir of the poet is prefixed, embracing the principal events of his life; but not calling for any particular criticism. By the by, it contains a whimsical misprint. Page lxxxiv. "plaintiff belled" is printed instead of plaintive.

Strictures on Colonel Napier's History of the Peninsular War. pp. 137. Longman and Co.

As able defence of the military opinions and conduct of General Lord Beresford, impugned by Colonel Napier, as the author declares in consequence of political prejudice. Without going into the whole question, we may truly state, that some of the charges of Col. N. are demonstrated to have been unfounded, and some of his imputations impossible.

ARTS AND SCIENCES.

SWAN RIVER, &c.

It appeared from a recent debate in the House of Commons, that our government were not in possession of despatches from the Swan River settlement beyond January 1830; but private letters, and accounts in newspapers, bring down intelligence to a much later date. We have the *Hobart Town Courier*, a very well-conducted and able journal, to August 14, which contains some curious notices of its new neighbours. For instance, a description of the earliest periodical which they have produced. As follows:

"The *Western Australia Gazette* is written on a sheet of small demy paper; and the price, marked on it in red ink, is 3s. 6d. The editor labours to prove its vast importance to the colony. He is, however, either himself, or his amanuensis, but an indifferent scholar; for many of the words are mispelt, and some of the sentences ungrammatical."

"As to the weather, he says: 'In the course of last winter various unfavourable circumstances have conspired to disappoint the expectations of the agriculturists. The seed process is retarded greatly; and the series of dry, cold, and barren weather (rather a poetical epithet as applied to weather) which we have experienced, has hardened the soil in a remarkable degree, and much impeded the progress of vegetation. We have had some refreshing showers of late, the good effects of which soon became visible; but the crops in general, and the green grass in particular, have received a shock from which they are not likely to recover.'"—June 1.

We are sorry to say that our authority adds:

"Provisions were getting very scarce at the settlement, and it was evident that farther supplies would be wanted from Van Diemen's Land. The editor says, 'nearly two thousand open mouths have been daily expecting supplies, and witnessed with great satisfaction the arrival of the *Eliza*, with a cargo from Hobart Town.'"

The annexed is still later: it is an extract of a letter dated Perth, Western Australia, June 8, 1830.

"We have had a most unwelcome visitor here in the shape of ophthalmia, and it is only now taking its departure, after having attacked the majority of our men, and considerably retarded that progress which, under existing circumstances, it is so desirable early cures should endeavour to attain. We are getting on

better than could have been expected, in defiance of calumny, interested reports, and the false representations of the disaffected; and, considering the great benefit which our newly formed colony must prove to Van Diemen's Land and New South Wales, for the next seven or eight years at least, it is quite surprising that it should be so fashionable to endeavour to cry it down, as we shall assuredly afford you an additional market for your produce."

"I assure you, that our colonising extends rapidly to the southward, and has already reached as far as Cape Lieuwinn, round the east side of which is a considerable bay into which a large body of water empties itself over a shallow channel of only three or four feet. Several rivers flow from the interior country into this lake. The principal one has been named the Blackwood, and about fifty settlers are already there to occupy its banks; more are about to follow; and when our military force is increased beyond one company, sixty men of the sixty-third regiment, a detachment of troops will be sent there. The site of a town, to be called Augusta (in honour of the Duke of Sussex, the name of whose title is attached to the whole district or country), has been fixed upon at the junction of this lake with the sea. The country is represented to be very good here, and easy of access, with very fine timber and plenty of water. There can be little doubt of its continuing good to the extremity of Dr. Wilson's journey northward from King George's Sound, which was about seventy miles; and there were some very good and gently undulating, and there were some considerable sheets of water in view, the connexion of which with the sea had not been ascertained. I have made a trip with the Lieutenant governor to Cape Naturaliste, Geographie Bay, and the coast between it and the Swan. I was exceedingly gratified with the general results; and at Port Leschenault we left a detachment of fifteen soldiers, under an officer and sergeant, and accompanied by our colonial surgeon. The character of the country here is superior to any part I have seen, except the Swan; and in point of timber it is unequalled by any I have seen in the country, consisting mostly of a species of mahogany, of a red colour, which will form a valuable export. Unlike the soil in most other places, it is here good in many parts close to the sea, and continues a rich brown earth for many miles inland and across the mountains, which lie from five to six leagues from the coast. This is the distance they generally preserve from the coast in the whole extent from Swan River; but behind Leschenault they turn to the S.E. and from Cape Naturaliste and Geographie Bay are not visible. The southern angle is abrupt and sandy, and is the extremity of a cluster of hills on the main ridge, called Roe's Range, so named after the surveyor-general. It is about twelve miles in length, north and south; and from the valley at each extremity, issues a fine river, which empties itself into the large sheet of water called Port Leschenault. The Collic, which is the northernmost, is the finest river, and, after passing a bar at its entrance, is navigable for large boats to the distance of twenty miles, where the site of a town has been fixed. Another river empties itself into the Collic about ten miles from its entrance, and appears to flow from the interior through a considerable break in the mountains, (Talbot Vale,) ten miles north from the Collic. This river is occupied on both banks, and to the extent of 100,000 acres, by the establishment of Lieut.-Colonel Latour, who has considerable property in Van Diemen's Land. The Preston is the southern river, and is already occupied from the entrance to the mountains, as well as much of the intermediate space between it and the Collic. It is navigable for about seven miles up, where the site of a township has also been fixed, as well as at the entrance of the large sheet of water which passes by the name of Port Leschenault, whereas it is in fact but a shallow lagoon, seven or eight miles in length, and two or three in breadth, with only four or five feet water at its entrance. The anchorage is sheltered from all points except between N. and W.N.W., but cannot be recommended for a winter resort on account of the prevailing north-westerly winds at that season. The rivers northward of Port Leschenault, which flow into two similar sheets of water to those already mentioned, are of the same description. The most northern of the two is called the Murray, and has its estuary on the north side of Cape Bouvard of the charts. It is the southern boundary of Mr. Peel's land, which extends thence across the mountains, and is bounded on the north by a line running due east from the bottom of Cockburn Sound. This is a new tract of country for him, or at least not the space he intended to occupy when he left England, as he did not arrive in time, but his present grant contains a greater quantity of good land than his original intended one, and a large party of his people are satisfactorily at work upon a portion of it. In consequence of the late shipwrecks in Gage's roads, a new anchorage has been taken up, about a mile to the southward, called Britannia roads, from the brig Britannia having first used it, and, in company with the Orelia, having rode out the late gales in them without being at all distressed. The town of Freemantle will now be extended to the coast opposite these roads, where the water runs deep close to the shore, for the convenience of shipping. The government has lately laid down some buoys and beacons for the guidance of the shipping in Cockburn Sound, which is an excellent and safe anchorage. Carpenters here earn 7s. a-day, and labourers 5s., independent of their food; but many indigent servants come out to Mr. Peel, and others who are not yet in a condition to employ them in such numbers, and they are consequently thrown on the public to look for employment, which will speedily reduce the rate of wages. Surveyors are much wanted, for I believe the

government surveyor has not one to assist him. The materials for a printing-press were on their way hither on board the Cumberland, but she was wrecked off Cape Leuwinn some months ago, while hauling too close to that headland in the night, and with her perished types and every thing connected with them."

The *Hobart Town Courier* also contains some interesting particulars relative to an expedition into another quarter of the interior, which we subjoin.

"Very favourable accounts have been received of the success of the expedition sent by government, under Mr. Robinson, to conciliate the native tribes. The news has reached us by the way of the Van Diemen's Land Company's establishment at Circular-head. Mr. Robinson, it appears, after making his way from Port Davey to Macquarie Harbour, from which latter place the last accounts of him were received, and where he obtained a reinforcement of supplies, had arrived within thirty miles of Circular-head. During this course he had frequent intercourse with several tribes, all of them of the most friendly nature. On one or two occasions he passed several days and nights alone amongst them, finding it prudent to send his companions apart to avoid a little jealousy which some of them appeared to have when several whites were collected together. We consider this as one of the most fortunate circumstances that could have occurred in the island, leading, as we trust it will do, to the most happy results, in finally putting a period to the late sanguinary and mistaken attacks of this unhappy people. Great praise is due to the skill and unwearied perseverance displayed by Mr. Robinson and all his enterprising party on this occasion, the spirit of which must be kept up with energy; while it admonishes us more than ever to co-operate as much as we possibly can in other parts of the island, by catching and gaining them over to civilisation, or else effectually to deter them from continuing their ravages on the confines of the settled districts. An attempt is now making to introduce Chinese labourers amongst us, but it is by no means impossible nor hopeless that we shall ultimately be enabled to tame and instruct these poor people to habits of useful industry."

CELESTIAL PHENOMENA FOR JANUARY.

20^d 5^h 33^m—the Sun enters Aquarius.

Lunar Phases and Conjunctions.

	D.	H.	M.

LITERARY AND LEARNED.

SOCIETY OF ANTIQUARIES.

ON Thursday week, Mr. Hallam, V.P., in the chair; several members were elected. The secretary commenced the reading of a paper communicated by S. Woodward, Esq., relative to Roman antiquities in the county of Norfolk, with a map. Mr. Woodward expressed the very laudable desire that antiquaries in the country would contribute to the Society maps of their respective districts with reference to the time of the Romans, and with a view to the composition of a Roman map of Great Britain.—Adjourned for the Christmas holidays, to next Thursday week.

ROYAL SOCIETY OF LITERATURE.

MEETING of Wednesday, Dec. 15.—Two ancient Latin manuscripts, in the possession of Sir Thomas Phillipps, Bart., were presented for the inspection of the meeting, and an account of their contents, in a letter from Sir Thomas to the secretary, was read. One of them, a document of the 12th or beginning of the 13th century, entitled "Mappæ Clavicula," contains a description of the various materials used in the art of painting and illuminating in those centuries, with the composition of the ingredients for forming the different colours, &c.; and, consequently, throws some light upon the state of chemical knowledge at that early period. The art of gilding and writing in gold letters is likewise explained; and the composition of the ground upon which the gold was laid, with the method of burnishing it,—an art which is said to be now lost, as far as relates to the illumination of MSS. This manuscript likewise describes several other mechanical arts, as practised at the above period; such as, the formation of glass, the method of dyeing skins, the mode of poisoning arrows, of making battering rams and other warlike implements, &c. The subject of the other manuscript is a narrative of the conspiracy of the Archbishop of York, and others, in the reign of Richard II. It is entitled "Succincta Historia de facinoribus Alexandri Nevyle, Archiepiscopi Ebor.; Robti. de Veer, Ducis Hiberniæ; Mich. de la Pole, Comitiss Suffolck, Cellarii Angliæ; Robti. Tresilian, Capitalis Justiciarii; et Nich. Brembre, militis." The object of the

conspiracy was to render the king independent of the aristocracy and the laws, by enabling him to levy subsidies, &c., without consulting parliament: it terminated in the defeat and capture of the conspirators, by the army of the nobility, under Henry Bolingbroke, Earl of Derby; and was followed by the exile of the Archbishop and confiscation of his estates, and by the execution or banishment of his associates. The narrative appears to have been the work of a partisan of the Duke of Gloucester.

A further reading followed, from Professor Lee's Memoir on the Origin of Heathenism. The Professor contends, in this portion of his essay, that the heresies of the first centuries were a mere adaptation of the emanation system of the heathen philosophers, to the form, and under the name, of Christianity; and examines Lardner's able attempts to refute the charges brought against the early heresiarchs.

Several members were elected at this meeting.

HEAD'S EDITION OF BRUCE'S TRAVELS.

To the Editor, &c.

SIR,—In one of the extracts from Major Head's *Life of Bruce*, given in your criticism on that work, which appeared in the *Literary Gazette* of Dec. 18, I was surprised to see that the author had been guilty of a very great mistake respecting the illustrious Johnson, whom he accuses of having, in his preface to his translation of the Jesuit Jerome Lobo's *Voyage to Abyssinia* (which the Major asserts was published when the work of Bruce was eagerly expected by the public), thrown out reflections against the veracity of the latter traveller. Now, as Bruce was born in 1733, and Johnson translated Lobo's *Voyage*, and wrote the preface to it, in the same year, 1733, and it was published in 1735, the Doctor must have added to his other endowments the gift of prophecy, if he had intended any attack on Bruce's reputation. It is really melancholy that such gross errors should be found in works professing to be particularly designed for the instruction of youth: yet Major Head seems to be perfectly confident in his own accuracy, and censures Johnson, by whom, he says, "these round rigmarole sentences were rolled against Bruce," &c. With respect to the Major's apparent contempt of the style of the great moralist and critic, if it prevents him from reading the *Rambler*, and the *Lives of the Poets*, I pity him, as he loses as high intellectual pleasure as a human being is capable of enjoying: but let him not insult the ashes of the mighty dead with erroneous accusations. As to the opinion which it is said Johnson expressed, "that after conversing a second time with Bruce, he doubted if he had been in Africa," it must have been given many years after the former dates I have mentioned, for Bruce returned from his travels at the end of the year 1761; and it was an opinion he held in common with many others. I agree, however, with Major Head, that Bruce was unfairly treated by the public; and although his violently forcing a timid man to eat raw beef, is no reason that we should swallow his account of the Abyssinians cutting beef-steaks from the living animal; yet when we reflect, that in this civilised country eels are flayed and lobsters are boiled alive, we may easily credit any narrative that tells us of the selfish and remorseless cruelty of man. The wonder is, how the remainder of the animal from which a feast has been made, should be able to walk on in a climate where severe wounds are soon followed by mortification of the injured part; and the wonder is so great, that it re-

quires the evidence of more than one witness to induce us to believe it; for one witness may be deceived, or may forget and confound what he has heard from others with what he has seen himself, and err in his narrative, without any intention of imposing on the world. I must now mention a circumstance related by the Major, and extracted by you, which makes more against him than the severest criticism I ever heard respecting him. I mean the traveller's evasive and witty answer to Single-speech Hamilton's requesting him to draw something in as good a style as those drawings of his which had been said to be done by Balugani. This answer should not have been brought forward by the counsel for the defendant, and proves how true the Spanish proverb is, "Save me from my friends."

I must now, Mr. Editor, express my surprise that in a work of such merit as the *Literary Gazette*, the errors I have alluded to should have escaped detection.* I feel as much abashed as the man who met Cato in a state of intoxication. Pray be a little more circumspect in future; and recollect that, in a work so near perfection as yours, and of such extensive circulation, the slightest inaccuracies cannot escape detection.

FINE ARTS.

NEW PUBLICATIONS.

National Portrait Gallery. Part XXI.
Fisher and Co.

THE portraits in this Part are those of the Marquess of Anglesey, a superb engraving; of the Earl of Carlisle, replete with expression and excellence; and of Sir Capt. John Franklin, strikingly characteristic. Without speaking of the biographical sketches (as we yet owe a notice to Part XX.) we can truly say, that three likenesses, of such a quality in art, and of such national interest, at twice the cost of these, would excite our wonder and admiration.

Her Serene Highness Marie Thérèse, Princess Esterhazy. Engraved by Dean, from an original miniature by Holmes. M. Colnaghi.

SOMEWHAT too voluptuous, perhaps, for a "Serene Highness;" but, nevertheless, a very beautiful portrait of a very beautiful woman. It is the seventy-third of the series of the Female Nobility, in *La Belle Assemblée*.

The King. From an original drawing of J. Jenkins. S. Gans.

Or the great, and we may add the fortunate, popularity of our most gracious sovereign, the number of portraits of him of an inexpensive kind, which have been published since his accession, affords a striking proof. That under our notice conveys a strong resemblance of the royal countenance.

* A second letter on the same subject, and signed "A Friend," has reached us; but the foregoing supercedes the necessity for publishing more than its concluding passage:—"The major should know, that the biography of men dead before our own times, requires something more, and is not to be properly handled by *Rough Sketches, Rapid Journeys* must be changed to *reading nights and quiet studies*, if we wish to become acquainted with the contemporaries of our hero—a knowledge not wholly superfluous, at least it used not to be considered so. But the school-master is abroad, and intellect is marching fast, perchance, into ignorance." With regard to our own share of blame for overlooking the anachronism in our notice of the volume, we can only throw ourselves on the mercy of our readers. It certainly did not strike us at the moment, when, relying on the author, we neglected to compare dates; and thus, in the haste constantly attendant upon a periodical of very frequent appearance, showed less of critical acuteness than we trust, is our wont.—Ed. L. G.

The Rev. Richard Warner, F.A.S.
S. C. Smith del.; L. Haghe lithog.

WE do not remember ever having seen the lithographic chalk handled in a more free and masterly manner. There is great character in the head; and the drapery reminds us of Lawrence.

Mr Walter Scott.—A fine bust of the author of *Waverley*, engraved by Thompson from Chantrey, is among the fine-arts novelties of the day. It is an ornament to the *New Monthly*; and if, as is stated, the commencement of a series of portraits of a similar kind, we must say it bespeaks a good measure of new-year activity in our contemporary.

ORIGINAL POETRY.

CHRISTMAS CAROL.

"Ivy, holly, and mistletoe,
Give me a penny before I go."
"Christmas comes but once a year."

THE rose, it is the love of June,
The violet that of spring;
Out on the faithless and fading flowers
That take the south wind's wing!
Such craven blooms I hold in scorn—
The holly's the wreath for a Christmas morn.
Its berries are red as a maiden's lip,
Its leaves are of changeless green;
And any thing changeless now, I wis,
Is somewhat rare to be seen.
The holly, which fall and frost has borne,
The holly's the wreath for a Christmas morn.
Its edges are set in keen array,
They are fairy weapons bared;
And in an unlucky world like ours
'Tis as well to be prepared.
Like the crest of a warrior worn,
The holly's the wreath for a Christmas morn.
It was so with England's olden race,—
But, alas! in this our day
We think so much of the present time,
That we cast the past away.
Let us do as they did ere we were born—
The holly's the wreath for a Christmas morn.
The holly, it is no green-house plant,
But grows in the common air;
In the peasant's lattice, the castle hall,
Its green leaves alike are there.
If its lesson in mind be borne,
The holly's the wreath for a Christmas morn.
L. E. L.

IMPROMPTU,

On reading the above charming Carol.

THE Christmas Carol thou sing'st so well,
No better I'd wish to know;
But why neglect, fair L. E. L.,
For the holly the mistletoe?
The one is a prickly, angry leaf,
The other an antidote to grief.
Though its berries red, like a maiden's lip,
May seem to invite to bliss;
They are false as the fruit of the Dead Sea
shore—
For the holly tempts not the kiss.
That joy to the holier plant we owe—
And so I prefer the mistletoe.
The warrior spike is a hateful sign
In the midst of holiday glee;
Then let the harmless symbol be mine,
That sprouts from the good oak tree.
Let fairy and warrior arms bow low
To the arms twined round 'neath the mistle-
toe. Ed. L. G.

BIOGRAPHY.

THOMAS DAVISON, ESQ.

WITH feelings of sincere sorrow we have to announce the death, on Tuesday last, at his house in Bedford Row, of this eminent and much-esteemed typographer. Mr. Davison was so well known to a wide and most respectable circle in London, that it needs no eulogy from our pen to excite a general sympathy for his loss: his memory will long be cherished by the numerous friends whom his honourable career made for him,—among whom he lived in unblemished mercantile reputation and the warmest social regard, and by whom his grave will be truly lamented. He was born at Durham, and brought up as a printer, in which business he passed forty years in the metropolis, and by his talents and abilities raised it, as a useful art, to high distinction. His works, by their correctness and beauty, by improvements which he made in inks, and other merits, acquired great celebrity; and few, indeed, of his competitors could approach the characters of what issued from his press. Among the evidences of this, we may mention the various editions of Byron, Rogers' Italy, the Keepsake, the Landscape Annual, and many other elegant productions.

To the enjoyments of private life Mr. Davison was powerfully recommended by his social qualities. To his fellows he was kind and generous: no man in his station ever performed more liberal actions; and not only brother-printers, but many booksellers and authors, have been indebted to his prompt liberality for effectual assistance, at times when a friend was most needed. This is a just tribute to his worth as a man. In company, the musical sweetness of a voice rarely equalled for compass and expression, imparted a charm to his companionship, and made him every where welcome.

Though for years subject to periodical illness from gout, his death was sudden; no danger being anticipated six hours before it took place. He has left a widow and family of five sons and three daughters; and if he has not enriched them by the accumulation of very great wealth, he has, we doubt not, from his large concerns, realised a comfortable independency, and, for the rest, bequeathed them a good name and the respect of all who knew him.

DRAMA.

ADELPHI.

IN our dramatic criticisms of this week, we shall reverse the usual order of theatrical notices, and, instead of the line of seniority—1. Drury Lane, 2. Covent Garden, 3. Minor Theatres—we are tempted to adopt the line of desert, and place that house at the head, small though it be, which has given us the best pantomime. Therefore stand forward, *Adelphi*, with your *Grimalkin the Great*, or *Harlequin the King of the Cats*; and a very Tybalt in his way. Beginning with the overture, a right pantomimic prelude, by Rodwell; the thing is full of bustle, drollery, excellent changes, good scenery, and wonderful feats, to the final drop of the curtain. The *Columbine* (Miss Stallard) is a plump and pretty girl, not wanting in activity; and though we have seen greater grace, we have seldom seen greater spirit. She has more of the English than the Italian or French in her; and is consequently a favourite with the public. But the weight of this light piece is laid upon stronger shoulders, and *Harlequin*, *Pantaloone*, *Clown*, and *Antico*, are admirably performed by Gibson, King, Sanders, and Brown. The grotesque figures into which these extraordinary per-

formers throw themselves, are incredible; and we fear (or rather we hope) that nothing short of ocular demonstration can convince our readers of the possibility of a gentleman's dancing a hornpipe upon his head better than most people can do on their feet,—of others hopping along on nameless parts,—of living pyramids, utterly contrary to all pre-conceived notions of humanity,—and of motion, postures, &c. &c., not readily to be reconciled with the known capabilities of man. Yet all these things, and more, are the attractions of every scene; and whether they produce most wonder or merriment, we are at a loss to determine. A *Sabot* dance, by the four, *Harlequin* and *Antico* being disguised as females, is capitally done; but the whole of the performances is of the genuine character which belongs to such holiday entertainments. Among the metamorphoses, a barrel of oysters turned into a punch-bowl and glasses, is one of the neatest on a small scale; while the change of a provision-stall into the stocks, and *vice versa*, is one of the cleverest. The Court of Chancery into the cage; the division of *Antico* into two parts in the doctor's shop, and his resuscitation whole; the clown at table, trying to drink a glass of wine and read the paper, in which he is whimsically foiled by magic movements, and many other tricks, afford ample proofs of the talent with which *Harlequin's* wand is employed on this occasion.

COVENT GARDEN.

AT this theatre an innovation has been ventured upon, for the purpose of introducing in dialogue the comic Hibernian abilities of Power, and thereby strengthening the piece by his brogue. This attempt is an error in design, and a failure in execution. Power is out of his element, and appears with no advantage to himself, and, as *Harlequin Pat* might say, with less to the pantomime. Our reprobatron is, however, confined to the introduction. After *Pat* has succeeded in milling the *Giant* on his own causeway, according to the versification of the irreverent, old, (and revolutionary) couplet,
"God made the great man to walk in the fields,
But God made the little to trip up his heels,"

the pantomime commences. Some very beautiful scenery is displayed. The perspective of the castle, the Boyne water, and the ship, are among the most effective. But there is little of invention, a scarcity of fun, and nothing to laugh at, in this expensive gewgaw, which is a farther departure from the true spirit of pantomime (so long declining); and though upheld to a certain degree by the skill and experience of Ellar, Barnes, and Panlo, a rather tiresome means of finishing an evening's amusement, scarcely enlivening our souls, yea, after the fifth unendurable sepulchral act of the *Fair Penitent*, which realises the foreigner's old joke of every thing being theatrical in England, where even funerals are performed. (Vide undertakers' signs *passim*.)

DRURY LANE.

To decide upon the claims of the rival pantomimes at the great houses to superiority, would be a task of no small difficulty. It would be alike unfair and inconsistent to inflict condemnation upon the one when preference was not deserved by the other. The glory of pantomimes has departed from them, and the dynasty of dioramas and panoramas has usurped the throne of Grimaldi. The mimicry of natural grandeur is offered as a substitute for the mimicry of human absurdity. The change is lamentably for the worse. In its attempts to

represent the grandeur of nature, the stage necessarily falls infinitely short of its object; it can only do so in diminutive and in depreciation; while over human folly it possesses a magnifying power, and, by exaggerating, renders it the more palpable for censure or for laughter. We cannot, then, without reluctance, give up our laugh at this season, which pantomimes, in their proper province, were wont to afford us; while, at the same time, they were wont to be the best periodical satires on the fashions and fooleries of the day; whereas now they are little else than a display of "scenery, machinery, decorations, and dresses." *Mother Carey* and her *Marine Stores*, together with a burlesque upon *Black-eyed Susan*, compose the introduction to the harlequinade; and, truth to confess, the tricks, changes, tumblers, &c. &c. &c. are, if any thing, duller than at Covent Garden. In the dioramic views by Stanfield, the Pass of the Simplon, and the Schalbet by moonlight, are probably the highest efforts to which scenic painting has hitherto attained, though the picture altogether is defective in the want of an adequate termination: the *Lago Maggiore*, with the *Bormean Islands*, though fine, are not a fine finale.

VARIETIES.

New Moving Power.—M. Zgiersky, of St. Petersburg, the author of several ingenious inventions and scientific works, is preparing a publication which will shortly appear in Latin, in Russ, and in French, and which will unfold some secrets of a nature calculated to be generally useful. This publication will contain the description of a new system for impelling air-balloons against the wind; and of the application of the same principle to put in motion carriages and agricultural instruments, without the assistance of horses, or other draught animals, and without steam-engines.

Cholera Morbus.—The Austrian government has sent several physicians into Russia to study the symptoms of the cholera morbus, and ascertain the nature of that dreadful malady. A similar mission is contemplated by the government of France. At a recent meeting of the French Academy, M. Moreau de Jonnes read a paper on the subject, and drew from the facts already established the following conclusions:—1st, That there is reason to hope that the cold of winter in the Russian provinces, which are situated between the 45 and 57 degrees of latitude, will arrest the effects and the propagation of the pestilential cholera; 2dly, that, nevertheless, numerous and uniform examples give reason to fear that it will only be suspended during the winter, and that it will recommence its ravages in spring; 3dly, that if, unhappily, such should be the case, the whole of Europe may be invaded, one part after another, according to the opinion of Lord Heytesbury, the English ambassador at Petersburg; an opinion confirmed by the consideration that the contagion must acquire new strength in passing into climates of a higher temperature than that of Russia.

The French Press.—*Le Globe* says, "Under the title of 'Patriotic Association of the Press,' a society is at present forming, for the purchase of all the *brevets d'imprimeur* vacant at Paris and in the departments, in order to retain for the French people the means of publishing, by journals, by pamphlets, or otherwise, all that may be serviceable to the public interest, conformably to law. Every thing which issues from these patriotic printing-offices will be sold at the cost price." It is

difficult to conceive a power more extensive, and at the same time more liable to abuse, than may eventually be monopolised by such a society.

Unicorns.—An Italian gentleman, named Barthema, said to be entitled to implicit credit, who has just returned from Africa, states, that he saw two unicorns at Mecca, which had been sent as a present from the King of Ethiopia to the sultan.—*Hobart Town Courier*.

Original Country of the Golden Pheasant.—Since the time of Buffon, the golden pheasant has been supposed to come originally from China, but upon what authority is unknown. A passage in Pliny notices this bird by a characteristic feature, which has been overlooked by naturalists, but which cannot be mistaken. The golden pheasant has, on each side of the head, beautiful orange-yellow feathers, which curve into a sort of conch, or ear, and are susceptible of voluntary motion. The common pheasant does not possess this ornament. Now Pliny expressly says: "*Phasianus in Colchis geminas ex plumâ aures submittunt subriguntque.*" From these facts, Dureau de la Malle, in the *Annales des Sciences Naturelles*, fixes the country of the bird at Colchis or Mingrelia, whence we have also the common pheasant, whose name is derived from Phasis, the principal river of Colchis. M. Gamba, French consul at Tiflis, is stated to have seen and chased the golden pheasant in the chain of the Caucasus, where large flocks are found in company with the common pheasant.

Gold Mine.—The Charlestown Gazette announces the discovery of a gold-mine in South Carolina, which is so productive that it employs about five hundred workmen. The metal is said to be of singular purity.

National Armies.—It has been computed that, in Prussia, there is one soldier in eighty inhabitants; in Austria, one in a hundred and eighteen; in France, one in a hundred and forty-two; in England, one in two hundred and twenty-nine; and in Russia, one in fifty-seven.

French Porcelain.—From the year 1810 to the year 1814, a beautiful piece of porcelain, called "The Tablet of the Marshals," which was placed in the museum at Paris, attracted the attention of all the amateurs of the arts. The painting upon it was considered to be Isabey's master-piece. It was a monument to the glory of the warriors who contributed to the triumphs of the memorable campaign of Vienna. In the midst was Napoleon on the throne; from which emanated rays, bearing the names of the various battles fought before the victory of Austerlitz. Between these rays were the portraits of twelve of the French marshals. On the restoration of the Bourbons, this magnificent work was expelled from the museum. It is now the property of an individual in Paris, who has offered it for sale.

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. 1. Jan. 1.]

A Popular Sketch of the History of Poland, by Mr. W. J. Thoms, editor of the "Early Prose Romances."—The *Incognita*; or, *Sins and Peccadilloes*, a Tale of Spain, by the author of "The Castilian," &c.—Observations on the present defective State of English Timber, the Causes which retard its Growth, together with the Means which ought to be immediately adopted to prevent the further premature Decay of this valuable Description of Property, by P. Lauder, of Cardiff.—We announce with pleasure that the comedy of *The Chancery Suit*, which entertains us, we know not why, too rarely on the stage, is about to appear in print.

LIST OF NEW BOOKS.

Longitude..... 0 3 51 W. of Greenwich.

Aurora Borealis.—On Christmas Day, at half-past 7 P.M., a very remarkable aurora borealis was observed from the vicinity of Keswick. Long arches of light extended from north to west through a sky for the most part clear, and almost eclipsed by their brilliance the splendence of an unclouded and frosty moon. These remained for some time stationary; when a sudden ruddy glow arose in the west, like the dull light of some vast and distant conflagration; and from this, as a centre, began to diverge streamers of fantastic form, which seemed to be composed of bundles of arrowy beams, for ever shifting like the movements of a mighty loom. At times, these appeared to press forward on the gaze with almost dazzling lustre; and then again they faded, as the light leapt from cloud to cloud, into a pale saffron effulgence. Once they assumed the likeness of Greek characters traced out upon the sky. The stars were seen distinctly through them. After exhibiting these various changes, in awful beauty, for about half an hour, the streamers ceased to play; but for some hours afterwards, that quarter of the sky retained a softened light, and the cloud-like arches were still perceptible.

Keswick, 27th Dec. 1830.

TO CORRESPONDENTS.

L's lines, though pretty, are inadmissible. We do not think the reclamation of Amed Pichot, respecting the fragment taken from the *Mercur de Franco* into the *Keepsake Français*, of sufficient public interest to make a stir about; though we are decidedly of opinion that fair and candid dealing in such matters is not only the most honest, but also the most beneficial line of conduct.

Messrs. George Barret and John Pye seem to complain with more cause, that a print published in the *Amulet* with their names, had previously 3400 impressions wrought off for the Anniversary. Not even steel can do justice to artists in this way.

Mr. Montague Burgoyne's petition to parliament for enclosing 12,000 acres of Epping Forest, does not fall within the plan of the *Literary Gazette*. We nevertheless heartily wish well to every project for the improvement of the condition of the poor.

P., of Cruikhowel, is wroth with Dr. Hibbert, or the writer of a paragraph in the *Literary Gazette* of Dec. 4, for imagining that the dark features of the natives of Auvergne shewed them to be of a Celtic origin. He declares there is no authority or sanction for such a supposition. *Non nostrum*, &c.

E. M., who impugns our grammar occasionally "in the use of the subjunctive, or future imperfect," and, at the same time, tells us he is "so (!) grammarian," would, we think, be much puzzled to adduce examples of what he contends for. We cannot, however, enter upon the controversy.

Mr. James's letter shall have due attention in our next. A second review of the *Life of Lord Rodney* is prepared.

We will endeavour to bring up the arrears of Advertisements next week.

ADVERTISEMENT.

Connected with Literature and the Arts.

ST. THOMAS'S HOSPITAL.—The Spring Course of Lectures will commence on Wednesday, Jan. 18th, 1830.

Theory and Practice of Medicine—Dr. Williams and Dr. Elliott.
 Materia Medica—Dr. Roots.
 Chemistry—Dr. Burton.
 Anatomy—Mr. John F. South and Mr. Tyrrell.
 Surgery—Mr. Green.
 Midwifery—Dr. Ferguson and Dr. Ashburnham.
 Comparative Anatomy—Mr. John F. South.
 Botany—Mr. .

Clinical Lectures will be given.
 Pupils entering to the Surgical Practice of this Hospital are allowed to attend that of Guy's.
 For Particulars, apply to Mr. Whitefield, Apothecary to St. Thomas's Hospital.

PANORAMA OF MADRAS, painted by William Daniell, R.A. and E. T. Parris, now exhibiting in the New Road, nearly opposite Dover Street.
 Admission, One Shilling.—Open from Ten till Dark.
 The Gallery is well warmed.

THE NATIONAL LIBRARY.

The Proprietors of this work feel themselves stimulated to fresh exertions to give the distinguished favour with which it has already been received.

The volumes of the 'National Library' already before the world may be confidently appealed to as proofs of zeal on the part of the Proprietors, to engage, without regard to expense, the assistance of writers of high celebrity, and to present to their readers a series of productions, which, as they are connected not with ephemeral, but with permanent subjects, may, years hence as well as now, be consulted for lively amusement as well as solid instruction.

The Life of the illustrious Byron, by Mr. Galt, who was personally known to him, has been stamped by the concurrent voice of the public with the character of a standard work, authentic in particulars, and dispassionate in judgment. That it should have met with opposition, was an inevitable consequence of the task—since the very name of Byron conjures up at once a host of angry disputes, who, having each his own theory to support, cannot all concur in the statements and opinions of the biographer, be these what they may. The memoir in question has, however, been so fortunate as already to rise superior to its assailants.

In speaking of the Rev. Mr. Gleig's History of the Bible, it has been said in a contemporary Journal, (*Lit. Gaz.*) that "it would be some ground of reproach to the friends of truth, if they had entirely neglected the new species of monthly publications as a means of diffusing religious knowledge among the higher and middle classes of society, and the present volume shews, in the happiest manner, how well they are adapted to convey that knowledge which makes faith more sure, and piety more enlightened." To this has been elsewhere added a commendation which the writer may reflect on with unqualified happiness during his life, namely, that "the republic which he has given in different stages of his History to the cavils of critics, are like the blessing of Providence, to arrest the spread of disbelief."

The History of Chemistry, which forms the third volume of the National Library, is from the pen of the learned Dr. Thomson, of the University of Glasgow; who, in recording the wonderful incidents and effects on accident, which marked the progress of Chemistry—in telling of the strange lives of its early students, (the Alchemists and others), and in describing at full the useful labours and discoveries of more recent professors—has written a book which, while it is characterised by scrupulous truth, and by practical information in every part, possesses much of the attraction of romance.

The remaining volumes of those hitherto published, are occupied by the History of Chivalry and the Crusades; and Festivals, Games, and Amusements, Ancient and Modern, by Mr. Horace Smith,—which are now just sent to the public. Of the charm of the former subject in an imaginative point of view, and of its great utility in illustrating the annals of European nations, it is needless to speak; while, as regards the present author's treatment, the numerous readers of "Richelieu" and "Darnley" have, no doubt, from its first announcement, formed high expectations, which, it is now being fulfilled.

To these, many other original works will immediately succeed; among which may be mentioned the History of the Royal Navy of England, from its first existence; and that of the British Army and its Services. Histories such as these, seem, of especial rights, to belong to an English National Library; and it is confidently believed by the Proprietors, that the great public interest of these subjects will appear not to have been confined to hands incompetent to the importance of the task. In Biography, too, the Proprietors hope to fulfil the expectations regarding this branch of Literature which they understand have been excited by the universal success of their first volume, the Life of Byron; in justification of which hope, they may specify two works as forthcoming, namely, "A New Life of Shakespeare," and "Lives of Distinguished Travellers."

Such are the principal features of the National Library as far as it has already proceeded; and such the nature of some of those works in preparation. But, impressed with the belief that it would be an ill-judged and unthrifty economy in the production of such valuable works, not to give ample scope to the eminent writers who are engaged in them, and we have, in the volumes already before the public, increased the size beyond what was first contemplated, the Proprietors have resolved to fix the price of the work at *Six Shillings per Volume*, being the same as is charged for a contemporary series of a similar nature; and the previous volumes will consequently for the future be sold also at the new price.

In conclusion, the Proprietors trust they shall not be accused of unjustifiable pride in expressing their belief, that, in the progress of their undertaking, they shall be the means of publishing, at low prices, a body of literature deserving the praise of having instructed many, and amused all; and, above every other species of utility, of being fit to be introduced, without reserve or exception, by the father of a family to the domestic circle.
 New Burlington Street, Jan. 1, 1831.

To Booksellers, Stationers, and Printers.

A YOUNG MAN, who has for some years had the management of an extensive Concern in the above Branches, is desirous of obtaining a Situation. The most respectable references, and security (if required), can be given.

John Murray, Albemarle Street.

For Schools and Young Persons.—Post 8vo. 6s. 6d.

INTRODUCTIONS to the STUDY of the GREEK CLASSIC POETS, for the Use of Young Persons at School or College.

By HENRY NELSON COLERIDGE.
 "Mr. Coleridge has done himself infinite credit by this little volume, which displays striking proofs of judgment, learning, and good taste. It is designed for the use of young persons at school or college, though, in truth, it may be used with advantage by persons of all ages. The present volume is only the first of a series intended to be put forth from time to time."—*Sun*.

PRINCIPLES of GEOLOGY:

being an Attempt to explain the former Changes in the Earth's Surface, by reference to Causes now in operation. 8vo. Illustrated with numerous Woodcuts, Plans, &c. Vol. I. 15s.

By CHARLES LYELL, F.R.S. Foreign Secretary of the Geological Society.

"It is very interesting and amusing, and should be read by every one who takes an interest in this rising branch of natural history."—*Jameson's Philosophical Journal*.

"This is a work of no ordinary mind. It bears deeply stamped upon it the impress of talent, knowledge, and research; and independent of the interesting and important nature of the subject, the depth and general justness of the author's views are recommended to us by the perspicuous and elegant language in which they are clothed. We cannot conclude this notice of the volume without strongly recommending it."—*Advertiser*.

2. The Journal of a Naturalist. 3d edition, foolscap 8vo. with numerous Additions and Improvements, Plates and Woodcuts, 18s.

Plants, trees, and stones, we note, Birds, insects, beasts, and many rural things.

"The author of the charming volume before us has produced one of the most interesting books we remember to have seen for a long time."—*New Monthly Magazine*, June 1829.

"The success of this interesting book, which has now reached a third edition, is a tolerable pledge of its merits. No one can have looked through its simple unassuming pages without pleasurable feelings."—*Atlantic Journal*, Sept. 1835.

3. Consolations in Travel; or, the last Days of a Philosopher. By Sir Humphry Davy, late President of the Royal Society. In 1 vol. Printed uniformly with "Salmonia." 6s. a new edition.

"We have been greatly delighted with this work."—*Monthly Review*.

"The work is of a very superior character, elaborately written, full of most ingenious thoughts, with some passages of great beauty."—*Artistic Journal*.

Also, by the same Author,
4. Days of Fly-Fishing, a new edition, with Plates and Woodcuts, 18s.

5. The Zoology of North America, Part I. containing the Quadrupeds. By John Richardson, M.D. Surgeon of the late Expedition under Captain Franklin. Illustrated by Twenty-eight spirited Engravings, by Thomas Landseer, &c. price 11. 11s. 6d.

8vo. 2s. 6d.

THE LIFE and SERVICES of CAPTAIN PHILIP BEAVER, R.N. late of H.M.S. Nassau.

By Captain W. H. SMYTH, R.N. K.S.F. F.R.S. and F.S.A.

"There is much in the volume which will be interesting to the general reader, and a professional student may derive from its perusal many valuable hints for his conduct."—*Monthly Review*.

"The volume before us deserves the honour of ranking with the lately published Memoir of Lord Collingwood, between whose character and that of Captain Beaver there exist some points of similitude. We predict that it will become popular, and we trust that it is the harbinger to other works of the same kind from the same pen."—*United Service Journal*.

Specimens of the Work and Engravings are to be seen in the Shop of every Bookseller in Great Britain and Ireland.

THE THEATRICAL LIBRARY, 29 vols. price 6s. 12s. boards.

Cumberland's British and Minor Theatres, an elegant Pocket Edition of the Acting Plays, containing 217 of the best Tragedies, by Comedies, Operas, Farces, Melo-Dramas, and Interludes, now performing in the London Theatres, embellished with 30 highly finished Portraits of celebrated Performers, and 200 Engravings of interesting Scenes.

Published by John Cumberland, Camden Town; and sold by

A new Play is published regularly every Tuesday, price 6d.

THE SONNETS OF SHAKESPEARE AND MILTON.

Also, price 1s. with 6 humorous Designs, Satan in Search of a Wife, with the whole Process of his Courtship and Marriage, and who danced at the Wedding. By G. S. Newton. London: Edward Moxon, 64, New Bond Street.

THE KEEPSAKE FOR 1831.

Price One Guinea, bound in crimson silk, 4s. 6d. Published for the Proprietor, by Hurst, Chance, and Co. 45, St. Paul's Churchyard; and Jennings and Chaplin, Cheap-side.

Where may be had, A few Copies of Large Paper, for 1829, 1830, 1831, with Proof Impressions on India paper, price 5s. 12s. 6d. each.

With One Hundred Engravings on Wood, Vol. I. price 21s. boards, of

THE GARDENS AND MENAGERIE OF THE ZOOLOGICAL SOCIETY DELINEATED; being Descriptions and Figures in Illustration of the Natural History of the Living Quadrupeds of the Society's Collection.

Vol. II. which is in preparation, will complete this Department of the Work. The whole will be comprised in Three Vols.: Two of Quadrupeds, and One of Birds.

The Work is also publishing in Numbers. No. XIII. containing Three Sheets of the Volume of Birds, is now ready, 5s. 6d. London: Published by John Sharpe, Piccadilly.

Printed on the best large post, in 4to. price, half-bound, extra enlarged, 9s.; enlarged, 6s.; small edition, 4s. 6d.; sewed, 3s.

RICHARDS'S UNIVERSAL DAIRY REMEMBRANCER for 1831, comprising a Diary for Memoranda, Appointments, Bills Due, &c. and a Variety of Information, adapted to the Use of Attorneys, Bankers, Merchants, and all Persons of Business.

Printed by and for C. Richards, St. Martin's Lane, Charing Cross; and sold by Simpkin and Marshall, and Suttaby and Co. Stationers' Court; Hurst, Chance, and Co. St. Paul's Churchyard; W. Low, Lamb's Conduit Street; and all Booksellers and Stationers in Town and Country.

8vo. 12s. 3d. edition of

ELEMENTS OF RHETORIC; comprising the Substance of the Article in the Encyclopedia Metropolitana, with Additions, &c.

By RICHARD WHATELY, D.D. Principal of St. Alban's Hall, and late Fellow of Oriel College, Oxford.

John Murray, Albemarle Street, London; and J. Parker, Oxford.

HISTORY OF THE WAR OF INDEPENDENCE IN GREECE.

By THOMAS KEIGHTLY, Esq. London: Hurst, Chance, and Co.; and Constable and Co. Edinburgh.

Where may be had, Just published, Vols. 57, 58, and 59, containing a complete edition of **Memoirs of Napoleon Buonaparte**, from the French of M. Fauvellet Bourrienne, Private Secretary to the Emperor. By John S. Memes, LL.D.

"We know, from the best political authority now living in England, that the writer's accounts are perfectly corroborated by facts."—*Literary Gazette*.

In 1 vol. foolscap 8vo. price 18s.

P O E M S. By SAMUEL ROGERS, Esq. Including Pleasures of Memory, Human Life, &c. &c. A new edition, embellished with Fifty Engravings on Wood, from the Designs of T. Stothard, Esq. R.A.

Printed for T. Cadell, Strand.

It is unnecessary to recommend this volume as an acceptable present to young persons at the present season.

MEMOIR of an EMPLOYÉ, addressed to the King.

By EDWARD SCHEERER, Esq. Of the Foreign Office.

"Rien n'est plus digne d'être d'avoir raison quant les gens accablent d'un tort."—*Vallière*. Printed by S. M'Dowall, Leadenhall Street.

New Year's Presents, &c. In 1 vol. small 8vo. neatly bound, with Plates, price 5s. to be ready with the Magazines, on the 1st of January.

FESTIVALS, GAMES, and AMUSEMENTS, Ancient and Modern.

By HORACE SMITH, Esq. Author of "Brambletye House," &c.

Forming the Fifth Number of the National Library.

The Book of the Seasons, by William and Mary Howitt. In small 8vo. with numerous Vignettes.

The Historical Traveller, by Mrs. Charles Gore. In small 8vo.

Philosophy in Sport made Science in Earnest, being an Attempt to illustrate the First Principles of Natural Philosophy, by the Aid of popular Toys and Sports. 2d edition, in small 8vo. with numerous Engravings.

Also lately published,

The Life of a Midshipman; a Tale, founded on Facts, and intended to correct an injudicious predilection in Boys for the Life of a Sailor. In 1 vol. post 8vo. with beautiful Frontispiece.

The History of Africa, Ancient and Modern, with several Engravings. In small 8vo. neatly bound, price 4s.

The Lives of Remarkable Youth. In small 8vo. price 4s. neatly bound, with Portraits of the Princess Victoria, Sir T. Lawrence, &c.

Historic Anecdotes of France. In small 8vo. price 4s. with Portraits of Marie Antoinette, Francis I., Henry IV., and Louis XIV.

Henry Calbraut and Richard Bentley, New Burlington Street.

In 8vo. price 6s.

FIRST PRINCIPLES OF MEDICINE.

By ARCHIBALD BILLING, M.D. Fellow of the Royal College of Physicians, Lecturer on the Theory and Practice of Medicine, and on Clinical Medicine in, and Physician to the London Hospital, &c. &c.

Printed for T. and G. Underwood, 28, Fleet Street.

Price 11s. 6s. boards, illustrated by above Forty Vignettes, from the Designs of Messrs. Stothard and Turner, R.A.

I T A L Y; a Poem.

By SAMUEL ROGERS, Esq. Printed for T. Cadell, Strand; and E. Moxon, 64, New Bond Street.

It is unnecessary to recommend this volume as a most splendid Christmas Present.

WILSON'S (Bishop) INTRODUCTION to the HOLY SACRAMENT, with the Communion Service annexed.

Wilson's (Bishop) Sacra Privata.

Andrew's (Bishop) Devotions, translated by Dean Stanhope.

"The above are neatly and uniformly printed, and have each a Portrait, engraved by Deane, price 2s. each, bound in black sheep; 5s. 6d. in black calf; and 4s. 6d. in morocco. The two first, or two last Works, may be had bound together, price 3s. 6d. in black sheep; 4s. in black calf; and 5s. 6d. in morocco.

Printed for C., J., G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

In 1 vol. 12mo. price 6s. boards, with a Memoir of the Author, and Portrait, the 11th edition of

FEMALE SCRIPTURE CHARACTERS, exemplifying Female Virtue.

Printed for C., J., G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and sold by Hatchard and Son, Piccadilly.

Of whom may be had, by the same Author,

1. The Rector's Memorandum Book; being the Memoirs of a Family in the North. 12mo. 7s.

2. The Beneficial Effects of the Christian Temper on Domestic Happiness. 12mo. 3s. 6d.

3. A Tour in France, in 1802. 2d edition, 3s. 6d.

THE POETICAL PRIMER, consisting of Short Extracts from Ancient and Modern Authors, selected and arranged progressively, for the Use of Children.

By Mrs. LAWRENCE. John Murray, Albemarle Street.

8 vols. foolscap 8vo. 10s.

PRACTICAL LECTURES on the HISTORICAL BOOKS of the OLD TESTAMENT.

By the Rev. HENRY LINDSAY, M.A. Perpetual Curate of Wimbledon, Surrey. John Murray, Albemarle Street.

3d edition, foolscap 8vo. 5s. 6d.

EASTERN SKETCHES, in Verse. By HENRY GALLY KNIGHT, Esq. John Murray, Albemarle Street.

Royal 8vo. with a Portrait and Fifty-two Illustrations, 2s. 2s.

LECTURES on SCULPTURE. By JOHN FLAXMAN, Esq. R.A.

As delivered by him before the President and Members of the Royal Academy. With a brief Memoir of the Author. John Murray, Albemarle Street.

With a Portrait, 2 vols. 8vo. 24s.

THE LIFE and CORRESPONDENCE of the late ADMIRAL RODNEY.

Edited by his Son-in-Law, MAJOR-GENERAL MUNDY. John Murray, Albemarle Street.

In royal 8vo. (printed uniformly with the Clerical Guide), price 18s. boards.

PATRONS ECCLESIASTICUS; or, a List of the Patrons of the Dignities, Offices, Vicarages, Perpetual Curacies, Chaplains, endowments, &c. of the United Church of England and Ireland; with the Valuation annexed of all Livings not exceeding 1500l. per Annum, as returned to Parliament in 1818.

Printed for C., J., G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

ENCYCLOPÆDIA LONDINENSIS; or, Dictionary of Arts, Sciences, and Literature. This Work is complete in 84 closely printed 4to. Volumes, and is illustrated with 1500 Engravings. Price 5l. each vol.

London: Published by Jones and Son, 17, Ave Maria Lane.

THE JOURNAL of a NATURALIST.

Third edition, with Illustrations, 15s.

2. Lyell's Principles of Geology, Vol. I. with Plates, 8vo. 15s.

3. Washington Irving's Works:—

1. The Sketch Book. 3 vols. post 8vo. 15s.

2. Bracebridge Hall. 3 vols. 16s.

3. Tales of a Traveller. 3 vols. 16s.

4. Life of Columbus. 4 vols. 8vo. 2s. 2s.

5. The Conquest of Granada. 3 vols. 8vo. 24s.

4. Hallam's Middle Ages, 4th edition, 3 vols. 8vo. 36s.

5. ——— History of England, 3 vols. 36s.

6. Bp. Heber's Indian Journals, 3 vols. 8vo. 36s.

7. Sonthey's Life of Nelson, pocket vol. 6s.

8. Modern Voyages and Discoveries:

1. Captain Parry's Five Voyages to the North Pole, with very many Plates. 6 pocket vols. 2s.

2. Captain Franklin's Two Journeys to the Polar Sea. Four pocket vols. 30s.

3. Denham's and Clapperton's African Discoveries, now first printed in 4 pocket vols. with Illustrations, 30s.

9. Captain Head's Rough Notes across the Pampas, and among the Andes. 8s. 6d.

10. George Head's Forest Scenes and Adventures in the Wilds of America. 8s.

11. Author of the Subaltern's Campaign at Washington and New Orleans. 8s. 6d.

12. Byron's Works, complete in Six pocket Vols. 97s. with the exception of Don Juan.

13. Romances of Eastern Life:

1. Adventures of Giovanni Finati. 3 vols. 14s.

2. Anastasis; or, Memoirs of a Modern Greek, 3 vols. crown 8vo. 11s. 6d.

3. Adventures of Hajji Baba. 3 vols. 21s.

4. Hajji Baba in England. 3 vols. 15s.

5. Sir John Malcolm's Sketches of Persian Life and Manners. 2 vols. post 8vo. 15s.

14. Croker's Irish Fairy Legends, 3 vols. 36s.

15. Hon. Agar Ellis's True History of the Man in the Iron Mask. 10s. 6d.

16. The Gold-Headed Cane, in post 8vo. 10s. 6d.

17. Bertha's Visit to her Uncle in England, new edition, 3 vols. only 10s. half-bound.

18. Mrs. Markham's History of England for Young Persons, with Wood Engravings. 3 vols. 12mo. 12s.; and History of France, 3 vols. 16s.

19. History of Spain, upon the Plan of Mrs. Markham's Histories. By Mrs. Calcott. 3 vols. 16s.

20. Stories from the History of England, for Children, 10th edition, 3s. half-bound.

21. Death-bed Scenes and Pastoral Conversations, 4th edition, printed to correspond with the Family Library. In 3 pocket vols. price only 12s.

John Murray, Albemarle Street.

AND

Journal of Belles Lettres, Arts, Sciences, &c.

This Journal is supplied Weekly, or Monthly, by the principal Booksellers and Newsmen, throughout the Kingdom; but to those who may desire its immediate transmission, by post, we recommend the LITERARY GAZETTE, printed on stamped paper, price One Shilling.

No. 729.

SATURDAY, JANUARY 8, 1831.

PRICE 8d.

REVIEW OF NEW BOOKS.

Memoirs of the Life of Sir Humphry Davy, Bart., late President of the Royal Society, &c. &c. By J. A. Paris, M.D., F.R.S. 4to. London, 1831. Colburn and Bentley. The name of Davy will remain associated with a bright era of English history so long as Science shall maintain her empire among civilised nations. If the same page blazon forth the actions of brave men, who, in the discharge of their duty, have been compelled to study the destruction of their species; how far greater are the claims to a niche in the temple of Fame, of men whose whole lives were devoted to the extension of the boundaries of science, and to the improvement of their fellow-men?

Although the annals of science, in almost every European language during the last thirty years, have preserved sufficient testimonials of the varied and splendid discoveries of the late President of the Royal Society; yet the friends of such objects as it is the charter of our *Literary Gazette* to advance, must hail with satisfaction the appearance of a work like the volume before us,—a work destined to occupy a prominent place in every select library in the United Kingdom. It would perhaps be difficult to find any living individual better qualified, in all respects, than Dr. Paris, to transmit down to posterity a faithful picture of the personal and scientific career of the late Sir Humphry Davy. With the facilities afforded by long personal friendship, local residence, and consequent access to the best sources for information, coupled, in no ordinary degree, with a certain unity of pursuits and studies between the biographer and the subject of his biography,—we should have been grievously disappointed to have found “the Life” of Sir H. Davy any thing short of a highly interesting personal memoir, as well as an able and learned commentary on the progress of physical science during the first quarter of the nineteenth century.

The discoveries of Davy in chemistry were as multifarious as they were important. We have neither leisure nor space, in our miscellaneous columns, to offer any thing in the shape of even a brief catalogue of his splendid researches. Whether we take into account the vast advantages which have accrued in the department of agriculture, from his elaborate experiments (in 1804 and 1805), on the nature and application of manures, and correcting the sterility of different soils,—his admirable experiments (which are recorded in the first part of the *Philosophical Transactions* for 1807) on the decomposition of the acids by galvanic agency,—his masterly application of the same specific agent in effecting the ultimate analysis of bodies which had been considered by all preceding chemists to be absolutely simple alkaline substances,—or the various and beautiful researches on the nature of flame, which led to the invention of the safety-lamp,—or the different power of attraction manifested by different metals for oxygen, which led to the preser-

vation of copper sheathing for shipping:—in all these cases, and many others that might be mentioned, it would be difficult to say whether the inventive genius that could first wing its way into these untrodden fields of science, or the ingenuity and marvellous accuracy with which those experiments were conducted to their ultimate results, are most entitled to the admiration and the gratitude of posterity.

Having received, at a late hour, only a portion of the work of Dr. Paris (in sheets), we can scarcely be called upon, in our present Number, to offer any decided opinion on its merits. We shall therefore confine ourselves to the selection of such extracts from the first portion of the volume as relate to the earlier period of the extraordinary character whose memoirs it records.

The late “Humphry Davy (says his biographer) was born at the town of Penzance, in Cornwall, on the 17th of December, 1788. His ancestors had long possessed a small estate at Varfell, in the parish of Ludgvan, in the Mount’s Bay, on which they resided.”

The infantile years of those individuals who become distinguished in after-life are not in general sufficiently indicative of that genius or peculiar bias which it is usually the pride of the historian to investigate; but young Davy seems to have exhibited a remarkable instance of precocious talent. His biographer rather grandiloquently observes: “I have spared no pains in collecting materials for the illustration of the earlier periods of his history; for to estimate the magnitude of an object we must measure the base with accuracy, in order to comprehend the elevation of its summit. Young Davy was first placed at a preparatory seminary kept by a Mr. Bushell, who was so struck with the progress he made, that he urged his father to remove him to a superior school. It is a fact worthy of being recorded, that he would, at the age of about five years, turn over the pages of a book as rapidly as if he were merely engaged in counting the number of leaves, or in hunting after pictures; and yet, on being questioned, he could generally give a very satisfactory account of the contents. I have been informed by Lady Davy, that the same faculty was retained by him through life, and that she has often been astonished beyond the power of expression, at the rapidity with which he read a work, and the accuracy with which he remembered it.

“Mr. Children has also communicated to me an anecdote which may be related in illustration of the same quality. Shortly after Dr. Murray had published his *System of Chemistry*, Davy accompanied Mr. Children in an excursion to Tunbridge, and the new work was placed in the carriage. During the occasional intervals in which their conversation was suspended, Davy was seen turning over the leaves of the book, but his companion did not believe it possible that he could have made himself acquainted with any part of its contents, until at the close of the journey he surprised him with a critical opinion of its merits.”

The admirers of the profound philosopher in after-life will scarcely be prepared to learn, from the memoir before us, that at the age of eight years “he was a great lover of the marvellous, and amused himself and his school-fellows by composing stories of romance and tales of chivalry, with all the fluency of an Italian improvisatore; and joyfully would he have issued forth, armed *cap-à-pie*, in search of adventures, and to free the world of dragons and giants.” The doctor proceeds, in his natural enthusiasm for the subject of his memoir, to institute a comparison, which we do not deem altogether felicitous: “In this early fondness for fiction,” says he, “and in the habit of exercising his ingenuity in creating imagery for the gratification of his fancy, Davy and Sir Walter Scott greatly resembled each other. . . . Had not Davy’s talents been diverted into other channels, who can say that we might not have received from his inventive pen a series of romantic tales, as beautifully illustrative of the early history of his native country as are the *Waverley Novels* of that of Scotland?—for Cornwall is by no means deficient in elfin apries and busy ‘pixeys;’ the invocation is alone required to summon them from their dark recesses and mystic abodes.”

Who would not have had cause to regret, had the splendid genius of Davy been thus “diverted” from the invaluable and inexhaustible fields of philosophy for those of poetry? The days are gone past when we have any right to expect universal genius in one individual. An Admirable Crichton can no longer be found in society, since the infinite subdivision and refinement of modern literature and science. For this reason, therefore, we shall pass over sundry pages of juvenile poetry given by the biographer as a specimen of the ardour with which young Davy wooed the Muses among the romantic scenery which surrounds the place of his nativity.

At the age of sixteen, it seems the future P. R. A. was articled to Mr. John Borlase, a respectable surgeon of Penzance; but it does not appear that he ever evinced any attachment to the profession, except in so far as the dispensation of medicines at first directed his attention to chemical pursuits, though he had shewn previously a strong bias for miscellaneous science.

“While with Mr. Borlase (says Dr. P.) it was his constant custom to walk in the evening to Merezion, to drink tea with an aunt, to whom he was greatly attached. Upon such occasions, his usual companion was a hammer, with which he procured specimens from the rocks on the beach. In short, it would appear that at this period he paid much more attention to philosophy than to physic; that he thought more of the bowels of the earth than of the stomachs of his patients; and that when he should have been bleeding the sick, he was opening veins in the granite. Instead of preparing medicines in the surgery, he was expe-

rimenting in Mr. Tonkin's garret, which had now become the scene of his chemical operations; and upon more than one occasion, it is said that he produced an explosion which put the doctor and all his glass bottles in jeopardy. 'This boy Humphry is incorrigible. Was there ever so idle a dog? He will blow us all into the air.' Such were the constant exclamations of Mr. Tonkin; and then, in a jocular strain, he would speak of him as 'the philosopher,' and sometimes call him Sir Humphry, as if prophetic of his future renown.

The following extract shews that young Davy not only pursued chemistry and mineralogy, but that he also laboured hard to overcome a natural impediment of speech, by following the celebrated prescription of Demosthenes:—

"It was Davy's great delight to ramble along the sea-shore, and often, like the orator of Athens, would he on such occasions declaim against the howling of the wind and waves, with a view to overcome a defect in his voice; which, although only slightly perceptible in his maturer age, was in the days of his boyhood exceedingly discordant. I may, perhaps, be allowed to observe, that the peculiar intonation he employed in his public addresses, and which rendered him obnoxious to the charge of affectation, was to be referred to a laborious effort to conceal this natural infirmity. It was also clear that he was deficient in that quality which is commonly called 'a good ear,' and with which the modulation of the voice is generally acknowledged to have an obvious connexion. Those who knew him intimately will readily bear testimony to this fact. Whenever he was deeply absorbed in a chemical research, it was his habit to hum some tune, if such it could be called, for it was impossible for any one to discover the air he intended to sing: indeed Davy's music became a subject of railery amongst his friends; and Mr. Children informs me, that during an excursion, they attempted to teach him the air of *God save the King*; but their efforts were perfectly unavailing."

"It may be a question," continues his biographer, "how far the following fact with which I have just been made acquainted, admits of explanation upon this principle (want of ear). On entering a volunteer infantry corps, commanded by a Captain Ocnam, Davy could never emerge from the awkward squad; no pains could make him keep the step; and those who were so unfortunate as to stand before him in the ranks, ought to have been heroes invulnerable in the heel. This incapacity, as may be readily supposed, occasioned him considerable annoyance; and he engaged a sergeant to give him private lessons; but all to no purpose. In the platoon exercise he was not more expert: and he whose electric battery was destined to triumph over the animosity of nations, could never be taught to shoulder a musket in his native town."

"That Davy, in his youth, possessed courage and decision, may be inferred from the circumstance of his having, upon receiving a bite from a dog supposed to be rabid, taken his pocket-knife, and without the least hesitation cut out the part on the spot, and then retired into the surgery and cauterised the wound,—an operation which confined him to Mr. Tonkin's house for three weeks. The gentleman from whom I received an account of this adventure, the accuracy of which has been since confirmed by Davy's sister, also told me, that he had frequently heard him declare his disbelief in the

existence of pain, whenever the energies of the mind were directed to counteract it; but, he added, 'I very shortly afterwards had an opportunity of witnessing a practical refutation of this doctrine in his own person; for upon being bitten by a conger eel, my young friend Humphry roared out most lustily.'"

We have given the preceding anecdotes from the earlier portion of Dr. Paris's work, not less with the view of diversifying our graver extracts, than from the conviction that the interest which attaches to the very minutiae of character is in proportion to the celebrity of the individual in after-life, and not from the intrinsic importance of the events recorded. It is always delightful to trace those latent springs of human action, which, in the buoyancy of the youthful mind, give a tone or bias towards certain pursuits, regarded by no small portion of mankind as a species of destiny. But our limits compel us to refer our readers to the work itself, for many interesting passages connected with those general developments of genius which distinguished the early career of Davy; while we offer a few extracts relative to the specific tendency of his mind in those pursuits which have enrolled his name among the benefactors of our species.

"As far as can be ascertained," says our author, "one of the first original experiments in chemistry performed by young Davy at Penzance, was for the purpose of discovering the quality of the air contained in the bladders of sea-weed, in order to obtain results in support of a favourite theory of light; and to ascertain whether, as land vegetables are the renovators of the atmosphere of land animals, sea-vegetables might not be the preservers of the equilibrium of the atmosphere of the ocean. From these experiments, he concluded that the different orders of the marine *cryptogamia* were capable of decomposing water, when assisted by the attraction of light by oxygen." The refined character of these chemical inquiries and experiments, for a youth of seventeen or eighteen years of age, is still more extraordinary, when we are told, that "his instruments were of the rudest description, manufactured by himself out of the motley materials which chance threw in his way; the pots and pans of the kitchen, and even the more sacred vessels and professional instruments of his surgery were, without the least hesitation or remorse, put in requisition."

Dr. Paris justly attributes the extraordinary inventive talent that Davy manifested in the construction of chemical apparatus, and in which he was altogether unrivalled, to his limited means in early life. "Had he," says the biographer, "been furnished with all these appliances which he enjoyed at a later period, he never could have acquired that tact of manipulation so as to meet and surmount the difficulties which must ever beset the philosopher in the unbeaten tracts of science."

Our limits compel us to defer noticing the more valuable portion of this interesting volume to our next No.

The Annual Obituary and Biography. 1831. Vol. XV. 8vo. pp. 508. London, Longman and Co.

BIOGRAPHY, although one of the most pleasing and instructive, has always appeared to us to be one of the most arduous and delicate species of literary composition; and some recent experience upon the subject confirms us in that opinion. Of the obstacles which oppose themselves to obtaining accurate information respecting any individual, no uninitiated person

can have any conception. To say nothing of more obvious difficulties, the errors of public records, the concealments of pride and folly, the perversions of affection on the one hand, and of malice on the other, and worse, because more provoking than all, the obstinate silence of indifference and apathy, frequently combine to render the biographer, like the unfortunate Othello, "perplexed in the extreme." But if this be the case with a single biography, prepared at leisure, from a profusion of materials, by a writer who probably had an intimate knowledge of his subject, how much more must it be so with a publication such as that under our notice, consisting of numerous memoirs, brought out with rapidity, in the compilation of which little assistance is to be expected from private sources, and the editor of which can, of course, only occasionally have enjoyed the advantage of a personal acquaintance with those, the chief incidents of whose lives he is suddenly required to narrate.

Yet, notwithstanding such difficulties, we can most truly say we never witnessed any task performed in a more laudable spirit than the present volume—or rather than all the recent volumes of this excellent work. Executed with sound discretion and in the most correct style (for the language is generally a model of good English), we recognise in all these memoirs that just medium, between fond panegyric and illiberal blame, which ought to belong to contemporary biography. An honest and manly feeling pervades the whole; and it is impossible to read the book without being made sensible that there is a right-mindedness, as well as a candid humanity of disposition, in the author, which peculiarly qualify him for the duty he in every other respect so ably discharges. Of the eighteen principal memoirs of which the volume consists, the longest and most important are those of George IV., Sir T. Lawrence, and Mr. Huskisson: in the first, the character of the deceased monarch is drawn with a masterly and impartial hand; in that of the late president, we find many circumstances of novelty, especially his addresses on several occasions to the students of the Royal Academy; and in the last mentioned, the account of the parliamentary and political career of Mr. Huskisson is the produce of much research and labour. We will, however, take our exemplification from another sketch.

Of Major-General David Stewart, the celebrated "Garth," a man who was in Scotland universally, and in England very generally, known, and who, by all who knew him, was admired, respected, and beloved, the volume contains an interesting memoir, which the editor states has been principally derived from an Edinburgh journal, entitled "The North Briton." After briefly describing General Stewart's brilliant professional exploits, from his entrance into the army in 1769, until the severe wounds which he received at the memorable battle of Maida (where his regiment, the 78th, so greatly distinguished itself) compelled him to retire upon half-pay, the memoir proceeds as follows:

"Having thus given a rapid outline of General Stewart's military career, it becomes our duty to say a few words of him in another capacity, namely, in that of author. But here it will not be necessary to detain the reader long; for to expatiate on the merits of a book so well known, and so universally admired, as his 'Sketches of the Character, Manners, and present State of the Highlanders of Scotland, with Details of the Military Service of the Highland Regiments,' would be equally su-

passions and impertinent. The circumstances under which it was undertaken were explicitly stated in a preface; towards the conclusion of which, the general expressed his hope that he should meet with the indulgence of the candid reader, in consideration of his great and anxious desire to do the subject justice. In that anticipation he was not disappointed. The unanimous suffrage of the public decreed that he had 'done the subject justice'; and, moreover, that he had produced one of the most interesting and instructive narratives that ever were written, besides furnishing a manual of lessons and examples, not for the Highland soldiers alone, but for the whole British army. But it is principally in the introductory chapters on the character, manners, and, above all, the present state of the Highlanders, that we recognise in the writer strong touches and traces of the man. General Stewart had been an attentive and anxious observer of the changes produced in the Highlands, in order to give effect to what was called the new system: he had seen whole glens depopulated at one fell swoop, to make way for sheep, the new tenants of the mountain wildernesses and solitudes: he had marked the gradual disappearance of the ancient race, under a system of wholesale innovation, or, we should rather say, proscription: he had witnessed the uprooting, as it were, of the aboriginal population from the soil, and the utter annihilation of the last remnants of those feelings and attachments, which sprang from the ancient system of patriarchal brotherhood, and stamped the Highland character with all its distinguishing peculiarities: he knew that all this overturning and desolation had been caused by a raging thirst of gain; the burning fever produced by which had extinguished or overpowered every kindlier feeling or emotion: he had been a frequent and heart-wrung spectator of the immediate misery caused by these changes; and many a time and oft had he shed a manly tear, as he beheld the poor disconsolate emigrants marching to the sea-shore, to shake the dust of their native land from off their feet, while the wailing tones of the bag-pipes, playing the mournful air of *Ha! mi tuidh*, echoed the feelings and emotions of their bursting hearts. But sentiment alone had not swayed him, or obtained the mastery over his judgment. He had anxiously watched the progress of the new system, examined it in all its details, and cautiously noted the effects of which it was productive; and the result of the whole was a deep conviction that it was not more illusory in its premises of profit, than destructive of the happiness of the people, and injurious to the best interests of his country. This conviction, accordingly, he proclaimed, reckless of all consequences to himself; and although economists and others have contested his principles, none have as yet dared to challenge a single one of the many striking and indisputable facts by which these principles are sustained and upheld. This work, as may easily be conceived, added greatly to the general's reputation, and probably contributed to his subsequent promotion. In fact, testimonies of approbation crowded in upon him from all quarters; among which were letters from his late Royal Highness the Duke of York, and from his present majesty, filled with the most flattering encomiums, and anxiously urging the gallant name to undertake a history, upon the same plan, of the whole British army. Not many months after the publication of his work on the Highlands, the death of his father, which was speedily followed by that

of his elder brother, put General Stewart in possession of the family estate of Garth. To a person less distinguished than he had now become, the succession to a property considerable in its extent, and inherited through a line of ancestors worthy of such a representative, would have conferred that rank and estimation which the world in general, but, above all, the people of Scotland, attach to the hereditary proprietor of a landed estate. But General Stewart had established for himself a character with the world, to which the mere acquisition of a patrimonial inheritance much more valuable than that which thus descended to him could add no consideration; and it is only necessary to refer to this part of his life, because he was now exposed to the temptations arising from an income which, although sufficient for his exemplary habits of life, was narrow compared with what many in his rank and station enjoyed, to swerve in practice from those principles which he had so powerfully advocated as to the management of Highland estates. But he was not of a mould to yield to such temptations; and the tenants on the estate of Garth will long remember and bless his memory, for the kind-hearted and considerate application to them of that wise and humane course which he had recommended to others, and the departure from which it was so much the object of his work to condemn. The success of his work, and an ardent desire to do justice to the history and character of the Highland clans, induced him, about this time, to collect materials for a history of the memorable rebellion in 1745 and 1746. This work he did not live to complete. But he devoted much time to gather from the best sources all that tradition, and the papers of the Highland families implicated in the events of those years, had recorded. In the year 1823, he made a tour through the Highland counties and the Western Isles on this errand. There were, however, many difficulties to prevent the satisfactory performance of the duties of the historian of that civil war. He not only did not complete the task which he contemplated, but it is doubtful whether, even if his life had been prolonged, he would ever have resumed it. The appointment of General Stewart to be governor and commander-in-chief of the island of St. Lucia gave great satisfaction to his friends, as a proof that his merits were not altogether overlooked by the government; but there were a few, who, on his departure, bade him in their minds an eternal farewell, never expecting to see him more. It was doubtless true that he had been in the West Indies twice before, and had escaped the malignant effects of the deleterious climate of those regions; but it was equally true that he had been long at home, accustomed to enjoy the comforts and luxuries of refined society, and to breathe the pure air of his native mountains; that he was well advanced in life, and that his constitution could scarcely be expected to possess the same accommodating power as when he was in the heyday of youth. Accordingly, not long after his arrival, he was seized with the fever of the country; and the first attack was, after a short interval, succeeded by a second, which had well nigh carried him off at once, and which unquestionably laid the foundation of the disease that at length terminated his active, useful, and spotless career. But, notwithstanding all this, the improvements he had commenced or projected afford a striking proof of his vigour of mind, and honourable zeal in the discharge of his duty. At the time of his death, two churches, one for Catholics and one for Pro-

testants, were nearly completed; a wharf, the only one in the island, was about half finished; and from the 10th of November to the 6th of December, when they were to leave off for the season, no fewer than 1350 persons had been busily at work making roads. Before the general's arrival there was not a mile of cart or carriage way in the country, except what the planters had made for conveying their sugars to the sea-side; the natural consequence of which was, that the cultivation of the interior of the island was wholly neglected, and the insalubrity of the climate thereby increased. Four bridges had also been contracted for, and five more were to have been built in the course of the last year. Nor, while labouring to construct inland communication, did General Stewart overlook an improvement which was still more imperiously called for, in the administration of justice. On his arrival, he found the old French laws still in force, and the courts in the most degraded, if not corrupt, state. His first care was to set about reforming the one, and placing the other upon a more efficient and respectable footing; and in this difficult but necessary task he had made considerable progress, when, on the 18th of December, 1829, death put a period to his active and useful labours. But he has not gone altogether without his reward. By these efforts for the improvement and prosperity of the people over whom he was placed, not less than by his habitual kindness and attention to every one who came within his notice, he secured the esteem and regard of all; while his unexpected and lamented death plunged the whole island in mourning, and affected every one as if he had been stricken by a domestic calamity. 'Never did I before witness,' says a friend, in a letter from St. Lucia, 'such general feelings of distress in any community, as this melancholy event has occasioned here. Every one is sensitively alive to the irreparable loss the colony has sustained by the death of David Stewart.' And, as a farther proof of the esteem in which he was held in the West Indies, it may be mentioned here, that, on the death of Sir Charles Brisbane, governor of St. Vincent, a number of the most respectable inhabitants sent a vessel express to St. Lucia, with a letter, urging General Stewart to make immediate application for the government of that island. For many reasons he declined complying with their request, though he could not possibly be insensible to the compliment implied in it. The illness which preceded the melancholy event was one of great severity, and of eight or ten days' duration. As we have already observed, subsequently to his arrival in St. Lucia, the general had two several attacks of fever, during the second of which his life was for many hours despaired of; but a sound and vigorous constitution at length prevailed, and his health was, to all appearance, pretty well established. The dregs of this second attack, however, appear never to have been thoroughly cleared away; and there obviously remained lurking in his constitution, and liable to be excited into fatal activity by a malignant climate, the elements of that mortal disease, which ultimately deprived his country of his valuable services, and humanity of one of its proudest ornaments. This is apparent from an incidental hint in a letter written by his own hand, so late as the 5th of December, 1829, only thirteen days before his death, and addressed to a friend in London: for although he concludes it by saying that 'every body is keeping in good health here,' he at the same time admits that he is himself suffering great annoyance from a boil deep-seated in his ear;

and, in point of fact, the excitement and irritation produced by this very boil (a consequence probably of the former attack) affected the brain, and finally proved the cause of death. There can be little doubt, also, that his unsparing, uncalculating activity, and the constant exertion, if not anxiety of mind, occasioned by superintending the multitude of reforms and improvements which he had set on foot, and which, at the time of his demise, were advancing rapidly to completion, must have contributed, in no small degree, to stimulate the action of the morbid tendencies engendered by his former illness, and to cut short a life which had been continually spent in doing good. He died, as he had lived, nobly, retaining his senses to the last, and evincing that calm fortitude and resignation with which the brave and the good meet death. 'His end,' says a friend, 'was like that of the blessed, calm and serene,—without a struggle or a sigh, passing from time to eternity.' After what has been said, it would be a vain and superfluous task to dilate on the merits, or attempt an elaborate sketch of the character of this truly brave and excellent man. As a soldier, he distinguished himself wherever an opportunity was afforded him, and was ever ready, at the call of his country, to face danger, and fight her battles, in any quarter of the world. As a citizen, and above all, as a country gentleman, he was distinguished for his public spirit, his active patriotism, and the zeal and perseverance with which he promoted and carried through whatever he deemed calculated to add to the comfort or advance the welfare of the district in which he resided. As a man, he was the kindest, the gentlest, the best: without guile himself, and unsuspicious of it in other men: free from all manner of envy and uncharitableness; upright, generous, and friendly almost to a fault; and probably more generally esteemed and beloved than any other man of his time. On looking around, therefore, we despair of finding any one to fill the space occupied by him. Many there doubtless are with more showy pretensions; not a few, perhaps, who, in several points, excelled him. But, taking him for all in all,—his sterling worth, his undisputed talents, his innate goodness, his unquenchable desire to confer benefits upon mankind, and particularly upon those whom ordinary minds regard with coolness and aversion,—we shall never look upon his like again. To the friendless he always proved himself a friend; and misfortune claimed, not his pity alone, but his protection. Straight-forward himself, he hated all manner of dissimulation or chicanery in others; and oppression of any sort he failed not to denounce with an honest indignation that never calculated the consequences to himself. In a word, he combined the sterner virtues with the gentler charities and affections of our nature in such a happy union, that he may be said to have approached as nearly to the character of a perfectly wise and good man as it is possible in the present imperfect state to arrive at."

This is the fifteenth volume. Of a few of the most distinguished individuals whose memoirs have, during the progress of the work, been included in its pages, separate accounts, necessarily more copious, have since appeared: but, with reference to the great mass of the subjects comprehended in its scope, we can safely say it contains a body of interesting information which is nowhere else to be found in a combined form, and which must give it a continually increasing value.

Memoirs of the Life, Writings, and Correspondence of James Currie, M.D. F.R.S. of Liverpool, &c. &c. Edited by his Son, W. Wallace Currie. 2 vols. 8vo. London, 1831. Longman and Co.

THOUGH the life of the biographer of Burns seemed in itself to be a literary desideratum, we confess that while we perused more than the first half of the first volume of these memoirs, we could not but feel that the particulars were dwelt upon rather more at length than the nature of the information given could well warrant. And now, after coming to the end of the second volume, though much relieved by the greater interest of all the latter parts, we are still of opinion that the filial piety of the editor has led him to produce a larger work than the fugitive taste of the public, pampered by epitomes and condensations, and spoilt by light and frivolous reading, will relish so well as a more limited performance. Yet, notwithstanding this, there is so much of sterling value in his labours, and they address so extensive a class of intelligent men, that we cannot doubt of their ample success.

The late Dr. Currie was a person of a strong mind, as well as of a fine imagination—a sound head and a good heart. His active and useful life, together with his literary productions, made him one of an influential circle, whether considered as citizens or authors—and we may indeed say, one of the most distinguished of that circle. His medical, political, and biographical writings were all extremely popular; and he enjoyed, both among those to whom his abilities were best known, and in the general world, a deservedly high reputation. It is right to preserve the remains of such a man, even though some of the topics which engaged his reflections have passed away; and in these volumes will be found much to admire, and much to apply to the present and future times.

We cannot in this *Gazette* enter upon the correspondence relative to the Life of Burns; nor tell more of Dr. Currie's own life, than that he was a native of Annandale; born 31st May, 1756; went early in a mercantile capacity to America, whence he was driven by the revolution; returned to Scotland; studied medicine with *éclat* in Edinburgh; settled as a physician at Liverpool, where he practised with fame and credit for many years; and died of a consumptive complaint at Sidmouth, Devonshire, August 31, 1805, aged forty-nine years.

It happens that biographical writing has of late occupied a good deal of our attention; and we shall commence our illustrations of Dr. Currie with an extract upon that subject, contained in a letter soon after the Life of Burns appeared.

"I long (he says) to hear what you think of my biography. If I have softened somewhat the deep shade of his errors, you will not find, I trust, that I have compromised the interests of virtue. Burns is not held up for imitation, but the contrary; though I have endeavoured to do justice to his talents and to the better qualities of his heart, and to cast a veil of delicacy and of sympathy over his failings and his destiny. In this way I am disposed to think the cause of virtue is best consulted. It is thus, I would persuade myself, that the melancholy precepts of example are best inculcated on the feeling heart."

We so entirely concur in the right feeling of this passage, that we would adopt its sentiments as a test of biography, from T. Moore to the late Juvenile Library.

The following on the Irish Union, and addressed to an Irish member in 1800, strikes us very forcibly: had it had its due weight, neither

Ireland nor Great Britain could have been as they are now.

"Two countries have already been incorporated with England, Wales and Scotland; and the effect of the union on the one and the other has been very different. Wales was united to England in the barbarous ages. Her own institutions, of whatever rude nature, were beaten down, and no others substituted. No means were used to instruct the people in the common language of the island, or to improve their habits in any respect. Hence the peasantry of Wales are essentially different from the English, unfit to enter into competition with them, and, in fact, an inferior race. They are destitute in general of the first elements of knowledge, and, in their habits and turn of mind, the same in a great many respects (some of which I will enumerate to you) as they were three hundred years ago. But I wish you to inquire into their condition personally, on your way to Liverpool, which, if you land at Holyhead, you may easily do; and it will be worth your while to devote a few days to the subject. During the period that Wales has been represented in the imperial parliament, not a single step has been taken for the civilisation of the people. It happened that the Scottish parliament established a system for the education of all classes of society, particularly of the poor, during the days of the Solemn League and Covenant. The restoration of the Stuarts overturned this system, as well as the present church establishment. Both were recovered on the Revolution,—at least in the year 1696. In consequence, both were incorporated into the union, though neither was formed in contemplation of it. Had it not been for this circumstance, can it be supposed that Scotland would now possess a school establishment? Never. The high church prejudices of the English hierarchy would have prevented it. Yet it is by this institution that the Scotch have been civilised—by this, in a great measure, have they been enabled to receive any positive advantage from the union. Now you see what I would be at. Propose, for God's sake, some system of education for your poor in the first instance, and let it be incorporated with your union. You are going to incorporate your church establishment, which will entail many curses on the country. For mercy's sake, think of incorporating some system of instruction!"

As it too late to reflect on this admirable advice? The subjoined brief passage, in a letter to Hector Macneill, will find an echo and a sigh in every breast which has had its pristine aspirations, its freshness and glow, its hopes and fancies, choked and destroyed by the necessary toils and business of the world.

"I am happy you find Grassmere so delightful. I once possessed a cast of mind that would have participated, in a high degree, in your present enjoyments. But whether I now in reality possess it, I do not know; for I never enjoy that blessed vacuity that gives the impressions of nature fair play. I have got into a state which makes me fully sensible of fatigue, while yet I find *inoccupation* intolerable; and the gleams of imagination which visit me are faint and fleeting, except those visitings which intrude on my sleep. I wish, for the experiment's sake, I was with you for a few days at present; I should enjoy your party extremely."

The following is also a beautiful feeling, when threatened too surely with a premature grave.

"Be assured I am not low, nor at all unhappy. I have not tasted the cup of life

unembittered; but certainly it has come to my lips a grateful beverage. I have a home that is very dear to me; my domestic circle even improves: I have friends that are very dear to me—friends of whom any man might be proud. I enjoy these blessings under the conditions which attach to all human enjoyments,—under an impression, indeed, that the tenure is in my case particularly uncertain; by which, however, their relish is not impaired, but improved. So much in answer to that part of your very kind letter which respects myself, and by which I am much affected.”

With the following more anecdotal extracts we must conclude; reserving the second volume, which consists of correspondence and a reprint of some of Dr. Currie's smaller pieces, for another notice.

“Johnny of Norfolk, *alias* the Rev. Dr. Johnson, is a creature of extraordinary simplicity. He is not unlike Dalton the lecturer. He is, I believe, a man of great kindness and worth, and even of learning. We talked much of Cowper. The truth respecting that extraordinary genius is, that he was a lunatic of the melancholy kind, with occasional lucid intervals. Johnny said that Cowper firmly believed that good and evil spirits haunted his couch every night, and that the influence of the last generally prevailed. For the last five years of his life a perpetual gloom hung over him; he was never observed to smile. I asked Johnny whether he suspected the people about him of bad intentions (which seems to me the Shibboleth of insanity), and he told me that he very often did. ‘For instance,’ observed he, ‘he said there were two Johnnies; one the real man, the other an evil spirit in his shape; and when he came out of his room in the morning, he used to look me full in the face, inquiringly, and turn off with a look of benevolence or of anguish, as he thought me a man or a devil!’ He had dreadful stomach complaints, and drank immense quantities of tea. He was indulged in every thing, even in his wildest imaginations. It would have been better if he had been regulated in all respects.—The life and death of the philosophic Gibbon formed a singular contrast to those of this unhappy poet. Mrs. Holroyd describes him as a man of the most correct manners, and of the most equal temper,—calm and rather dignified, and conversing with all the flow of his writings. He was devoted to all the comforts of life, and liked the elegancies and even delicacies of the table, but ate and drank sparingly. A few days before he died, he conversed on a future state with Mrs. Holroyd, of which he spoke as one having little or no hope; but professed that neither then, nor at any time, had he ever felt the horror which some express, of annihilation.”

Epitaph, by Professor Smyth, on the tomb of Dr. Currie, at Sidmouth.

“The humbler virtues, which the friend endear,
The soften'd worth, which wakes affection's tear;
And all that brightens in life's social day,
Lost in the shades of death, may pass away.
Fast comes the hour, when no fond heart shall know
How lov'd was once the sacred rest below:
Here cease the triumphs which the grave obtains,—
The man may perish, but the sage remains.
Freedom and Peace shall tell to many an age
Thy warning counsels, thy prophetic page:
Art, taught by thee, shall o'er the burning frame
The healing freshness pour, and bless thy name:
And Genius, proudly, while to Fame she turns,
Shall twine thy laurels with the wreath of Burns.”

The Cabinet Cyclopaedia, &c. Natural Philosophy. A Preliminary Discourse. By J. F. W. Herschel, Esq. London, 1831. Longman and Co.

IN our last No. we could only allude to this volume, and the elaborate and philosophical nature of its contents prevent us from doing much more now; for we should consider any insulated extracts, however striking, very ill calculated to convey an adequate notion of its value and importance. The author has fathomed the depths of science, and is informed, to the very latest period, of all the discoveries and improvements that have been made in its numerous branches at home and abroad. With this mind he has adopted an almost axiomatic mode of conveying to the world the prodigious mass of his own intelligence; and a moment's reflection will shew the reader how impossible it is in a brief (or even a very long review) to do justice to such a production. We can do nothing but select two or three passages from the condensed abundance of matter, in order to exhibit its style and manner—of its variety and worth we can communicate no idea. The author thus, on a broad scale, defends the study of natural philosophy.

“Nothing, then, can be more unfounded than the objection which has been taken, *in limine*, by persons, well meaning perhaps, certainly narrow-minded, against the study of natural philosophy, and indeed against all science,—that it fosters in its cultivators an undue and overweening self-conceit, leads them to doubt the immortality of the soul, and to scoff at revealed religion. Its natural effect, we may confidently assert, on every well-constituted mind, is and must be the direct contrary. No doubt, the testimony of natural reason, on whatever exercised, must of necessity stop short of those truths which it is the object of revelation to make known; but, while it places the existence and principal attributes of a Deity on such grounds as to render doubt absurd, and atheism ridiculous, it unquestionably opposes no natural or necessary obstacle to further progress: on the contrary, by cherishing as a vital principle an unbounded spirit of inquiry, and ardency of expectation, it unfetters the mind from prejudices of every kind, and leaves it open and free to every impression of a higher nature which it is susceptible of receiving, guarding only against enthusiasm and self-deception by a habit of strict investigation, but encouraging, rather than suppressing, every thing that can offer a prospect or a hope beyond the present obscure and unsatisfactory state. The character of the true philosopher is to hope all things not impossible, and to believe all things not unreasonable. He who has seen obscurities which appeared impenetrable in physical and mathematical science suddenly dispelled, and the most barren and unpromising fields of inquiry converted, as if by inspiration, into rich and inexhaustible springs of knowledge and power on a simple change of our point of view, or by merely bringing to bear on them some principle which it never occurred before to try, will surely be the very last to acquiesce in any dispiriting prospects of either the present or future destinies of mankind; while, on the other hand, the boundless views of intellectual and moral as well as material relations which open on him on all hands in the course of these pursuits, the knowledge of the trivial place he occupies in the scale of creation, and the sense continually pressed upon him of his own weakness and incapacity to suspend or

modify the slightest movement of the vast machinery he sees in action around him, must effectually convince him that humility of pretension, no less than confidence of hope, is what best becomes his character. But while we thus vindicate the study of natural philosophy from a charge at one time formidable from the pertinacity and acrimony with which it was urged, and still occasionally brought forward to the distress and disgust of every well-constituted mind, we must take care that the testimony afforded by science to religion, be its extent or value what it may, shall be at least independent, unbiassed, and spontaneous. We do not here allude to such reasons as would make all nature bend to their narrow interpretations of obscure and difficult passages in the sacred writings: such a course might well become the persecutors of Galileo and the other bigots of the fifteenth and sixteenth centuries, but can only be adopted by dreamers in the present age. But, without going these lengths, it is no uncommon thing to find persons earnestly attached to science, and anxious for its promotion, who yet manifest a morbid sensibility on points of this kind,—who exult and applaud when any fact starts up explanatory (as they suppose) of some scriptural allusion, and who feel pained and disappointed when the general course of discovery in any department of science runs wide of the notions with which particular passages in the Bible may have impressed themselves. To persons of such a frame of mind it ought to suffice to remark, on the one hand, that truth can never be opposed to truth; and, on the other, that error is only to be effectually confounded by searching deep and tracing it to its source. Nevertheless, it were much to be wished that such persons, estimable and excellent as they for the most part are, before they throw the weight of their applause or discredit into the scale of scientific opinion on such grounds, would reflect, first, that the credit and respectability of any evidence may be destroyed by tampering with its *honesty*; and, secondly, that this very disposition of mind implies a lurking mistrust in its own principles, since the grand and indeed only character of truth is its capability of enduring the test of universal experience, and coming unchanged out of every possible form of *fair* discussion.”

The following is curious—

“The annual consumption of coal in London is estimated at 1,500,000 chaldrons. The effort of this quantity would suffice to raise a cubical block of marble, 2200 feet in the side, through a space equal to its own height, or to pile one such mountain upon another. The Monte Nuovo, near Pozzuoli, (which was erupted in a single night by volcanic fire,) might have been raised by such an effort from a depth of 40,000 feet, or about eight miles. It will be observed, that, in the above statement, the inherent power of fuel is, of necessity, greatly under-rated. It is not pretended by engineers that the economy of fuel is yet pushed to its utmost limit, or that the whole effective power is obtained in any application of fire yet devised; so that were we to say 100 millions instead of 70, we should probably be nearer the truth. The powers of wind and water, which we are constantly impressing into our service, can scarcely be called latent or hidden, yet it is not fully considered, in general, what they do effect for us. Those who would judge of what advantage may be taken of the wind, for example, even on land (not to speak of navigation), may turn their eyes on Holland. A great portion of the most valuable

and populous tract of this country lies much below the level of the sea, and is only preserved from inundation by the maintenance of embankments. Though these suffice to keep out the abrupt influx of the ocean, they cannot oppose that law of nature, by which fluids, in seeking their level, insinuate themselves through the pores and subterraneous channels of a loose sandy soil, and keep the country in a constant state of infiltration from below upwards. To counteract this tendency, as well as to get rid of the rain water, which has no natural outlet, pumps worked by windmills are established in great numbers, on the dams and embankments, which pour out the water, as from a leaky ship, and in effect preserve the country from submersion, by taking advantage of every wind that blows. To drain the Haarlem lake would seem a hopeless project to any speculators but those who had the steam-engine at their command, or had learnt in Holland what might be accomplished by the constant agency of the desultory but unwearied powers of wind. But the Dutch engineer measures his surface, calculates the number of his pumps, and, trusting to time and his experience of the operation of the winds for the success of his undertaking, boldly forms his plans to lay dry the bed of an inland sea, of which those who stand on one shore cannot see the other."

In treating of light and colour, Mr. Herschel remarks—

"That two lights should in any circumstances combine to produce darkness, may be considered strange, but is *literally true*."

And leaving this as a bait to induce our less scientific readers to seek the explanation, we bid this excellent volume good bye.

The Family Library, Vol. XVIII. Voyages, &c. of the Companions of Columbus. By Washington Irving. 12mo. pp. 327. London, 1831. Murray.

In a hasty note in our last *Gazette* we characterised this volume; and we have now only to sustain our opinion by examples of its most interesting features. The period embraced is from the very close of the fifteenth century (1499) to about the first quarter of the next; and the chief voyagers are Alonzo de Ojeda (with whom *Amerigo Vespucci* sailed), *Vicente Yañez Pinzon*, *Diego de Nicuesa*, the celebrated *Vasco Nuñez*, *Juan Ponce de Leon* the discoverer of Florida, and a few others. The adventures, the disasters, and, generally, the melancholy fate of these daring bucaniers and their companions, form a striking drama in the history of mankind, from which we shall extract a few passages. The discovery of the Gulf of Venezuela, by Ojeda, is a curious specimen.

"Proceeding along the coast, he arrived at a vast deep gulf, resembling a tranquil lake; entering which, he beheld on the eastern side a village, the construction of which struck him with surprise. It consisted of twenty large houses, shaped like bells, and built on piles driven into the bottom of the lake, which in this part was limpid, and of but little depth. Each house was provided with a drawbridge, and with canoes, by which the communication was carried on. From these resemblances to the Italian city, Ojeda gave to the bay the name of the Gulf of Venice; and it is called at the present day *Venezuela*, or little Venice: the Indian name was *Coquibacoa*. When the inhabitants beheld the ships standing into the bay, looking like wonderful and unknown apparitions from the deep, they fled with terror

to their houses, and raised the drawbridges. The Spaniards remained for a time gazing with admiration at this amphibious village, when a squadron of canoes entered the harbour from the sea. On beholding the ships they paused in mute amazement; and on the Spaniards attempting to approach them, paddled swiftly to shore, and plunged into the forest. They soon returned with sixteen young girls, whom they conveyed in their canoes to the ships, distributing four on board of each, either as peace-offerings, or as tokens of amity and confidence. The best of understanding now seemed to be established; and the inhabitants of the village came swarming about the ships in their canoes, and others swimming in great numbers from the shores. The friendship of the savages, however, was all delusive. On a sudden, several old women at the doors of the houses uttered loud shrieks, tearing their hair in fury. It appeared to be a signal for hostility. The sixteen nymphs plunged into the sea and made for shore; the Indians in the canoes caught up their bows and discharged a flight of arrows; and even those who were swimming, brandished darts and lances, which they had hitherto concealed beneath the water. Ojeda was for a moment surprised at seeing war thus starting up on every side, and the very sea bristling with weapons. Manning his boats, he immediately charged amongst the thickest of the enemy, shattered and sunk several of their canoes, killed twenty Indians, and wounded many more, and spread such a panic among them, that most of the survivors flung themselves into the sea and swam to shore. Three of them were taken prisoners, and two of the fugitive girls, and were conveyed on board of the ships, where the men were put in irons. One of them, however, and the two girls, succeeded in dexterously escaping the same night. Ojeda had but five men wounded in the affray, all of whom recovered. He visited the houses—but found them abandoned and destitute of booty; notwithstanding the unprovoked hostility of the inhabitants, he spared the buildings, that he might not cause useless irritation along the coast.

"It is worthy of particular mention, that Ojeda, in his report of his voyage to the sovereigns, informed them of his having met with English voyagers in the vicinity of *Coquibacoa*, and that the Spanish government attached such importance to his information, as to take measures to prevent any intrusion into those parts by the English. It is singular that no record should exist of this early and extensive expedition of English navigators. If it was undertaken in the service of the crown, some document might be found concerning it among the archives of the reign of *Henry VII.* The English had already discovered the continent of North America. This had been done in 1497, by *John Cabot*, a Venetian, accompanied by his son *Sebastian*, who was born in Bristol. They sailed under a license of *Henry VII.*, who was to have a fifth of the profits of the voyage. On the 24th June they discovered Newfoundland, and afterwards coasted the continent quite to Florida, bringing back to England a valuable cargo and several of the natives. This was the first discovery of the mainland of America. The success of this expedition may have prompted the one which Ojeda encountered in the neighbourhood of *Coquibacoa*."

The jealousy of the Spanish government on this occasion, led to the grant of much greater powers to Ojeda when he sailed on his second voyage in 1502. "He was to colonise *Coquibacoa*, and, as a recompense, was to enjoy one

half of the proceeds of its territory, provided the half did not exceed 300,000 maravedies: all beyond that amount was to go to the crown. A principal reason, however, for granting this government and those privileges to Ojeda, was that, in his previous voyage, he had met with English adventurers on a voyage of discovery in the neighbourhood of *Coquibacoa*, at which the jealousy of the sovereigns had taken the alarm. They were anxious, therefore, to establish a resolute and fighting commander like Ojeda upon this outpost; and they instructed him to set up the arms of Castile and Leon in every place he visited, as a signal of discovery and possession, and to put a stop to the intrusions of the English."

Ojeda's whole career is beyond a romance! Proceeding as above directed, he landed on the coast of *Carthage*; and "when the friars had read a pious manifesto, Ojeda made signs of amity to the natives, and held up glittering presents. They had already suffered, however, from the cruelties of white men, and were not to be won by kindness. On the contrary, they brandished their weapons, sounded their conchs, and prepared to make battle. *Juan de la Cosa* saw the rising cholera of Ojeda, and knew his fiery impatience. He again entreated him to abandon these hostile shores, and reminded him of the venomous weapons of the enemy. It was all in vain: Ojeda confided blindly in the protection of the Virgin. Putting up, as usual, a short prayer to his patroness, he drew his weapon, braced his buckler, and charged furiously upon the savages. *Juan de la Cosa* followed as heartily as if the battle had been of his own seeking. The Indians were soon routed, a number killed, and several taken prisoners; on their persons were found plates of gold, but of an inferior quality. Flushed by this triumph, Ojeda took several of the prisoners as guides, and pursued the flying enemy four leagues into the interior. He was followed, as usual, by his faithful lieutenant, the veteran *La Cosa*, continually remonstrating against his useless temerity, but hardly seconding him in the most hare-brained perils. Having penetrated far into the forest, they came to a strong hold of the enemy, where a numerous force was ready to receive them, armed with clubs, lances, arrows, and bucklers. Ojeda led his men to the charge with the old Castilian war-cry, '*Santiago!*' The savages soon took to flight. Eight of their bravest warriors threw themselves into a cabin, and plied their bows and arrows so vigorously, that the Spaniards were kept at bay. Ojeda cried shame upon his followers to be daunted by eight naked men. Stung by this reproach, an old Castilian soldier rushed through a shower of arrows and forced the door of the cabin, but received a shaft through the heart, and fell dead on the threshold. Ojeda, furious at the sight, ordered fire to be set to the combustible edifice; in a moment it was in a blaze, and the eight warriors perished in the flames. Seventy Indians were made captive and sent to the ships, and Ojeda, regardless of the remonstrances of *Juan de la Cosa*, continued his rash pursuit of the fugitives through the forest. In the dusk of the evening they arrived at a village called *Yurbaco*; the inhabitants of which had fled to the mountains with their wives and children and principal effects. The Spaniards, imagining that the Indians were completely terrified and dispersed, now roved in quest of booty among the deserted houses, which stood distant from each other, buried among the trees. While they were thus scattered, troops of savages rushed forth, with furious yells, from all parts

of the forest. The Spaniards endeavoured to gather together and support each other, but every little party was surrounded by a host of foes. They fought with desperate bravery; but for once their valour and their iron armour were of no avail; they were overwhelmed by numbers, and sank beneath war-clubs and poisoned arrows. Ojeda on the first alarm collected a few soldiers, and ensconced himself within a small enclosure, surrounded by palisades. Here he was closely besieged, and galled by flights of arrows. He threw himself on his knees, covered himself with his buckler, and being small and active, managed to protect himself from the deadly shower; but all his companions were slain by his side, some of them perishing in frightful agonies. At this fearful moment the veteran La Cosa, having heard of the peril of his commander, arrived, with a few followers, to his assistance. Stationing himself at the gate of the palisades, the brave Biscayan kept the savages at bay until most of his men were slain, and he himself was severely wounded. Just then Ojeda sprang forth like a tiger into the midst of the enemy, dealing his blows on every side. La Cosa would have seconded him, but was crippled by his wounds. He took refuge with the remnant of his men in an Indian cabin; the straw roof of which he aided them to throw off, lest the enemy should set it on fire. Here he defended himself until all his comrades, but one, were destroyed. The subtle poison of his wounds at length overpowered him, and he sank to the ground. Feeling death at hand, he called to his only surviving companion. 'Brother,' said he, 'since God hath protected thee from harm, sally forth and fly, and if ever thou shouldst see Alonso de Ojeda, tell him of my fate!' Thus fell the hardy Juan de la Cosa, faithful and devoted to the very last; nor can we refrain from pausing to pay a passing tribute to his memory. He was acknowledged by his contemporaries to be one of the ablest of those gallant Spanish navigators who first explored the way to the New World. But it is by the honest and kindly qualities of his heart that his memory is most endeared to us; it is, above all, by that loyalty and friendship displayed in this his last and fatal expedition. Warmed by his attachment for a more youthful and a hot-headed adventurer, we see this wary veteran of the seas forgetting his usual prudence and the lessons of his experience, and embarking heart and hand, purse and person, in the wild enterprises of his favourite. We behold him watching over him as a parent, remonstrating with him as a counsellor, but fighting by him as a partisan; following him, without hesitation, into known and needless danger, to certain death itself, and shewing no other solicitude in his dying moments, but to be remembered by his friend."

Ojeda alone escaped; and afterwards being joined by Nicuesa, took a terrible revenge on the unfortunate natives.

The two governors, no longer rivals, landed four hundred of their men and several horses, and set off with all speed for the fatal village. They approached it in the night, and, dividing their forces into two parties, gave orders that not an Indian should be taken alive. The village was buried in deep sleep, but the woods were filled with large parrots, which, being awakened, made a prodigious clamour. The Indians, however, thinking the Spaniards all destroyed, paid no attention to these noises. It was not until their houses were assailed, and wrapped in flames, that they took the alarm. They rushed forth, some with arms, some weaponless, but were received at their

doors by the exasperated Spaniards, and either slain on the spot, or driven back into the fire. Women fled wildly forth with children in their arms; but at sight of the Spaniards glittering in steel, and of the horses, which they supposed ravenous monsters, they ran back, shrieking with horror, into their burning habitations. Great was the carnage, for no quarter was shewn to age or sex. Many perished by the fire, and many by the sword. When they had fully glutted their vengeance, the Spaniards ranged about for booty. While thus employed, they found the body of the unfortunate Juan de la Cosa. It was tied to a tree, but swollen and discoloured in a hideous manner by the poison of the arrows with which he had been slain. This dismal spectacle had such an effect upon the common men, that not one would remain in that place during the night. Having sacked the village, therefore, they left it a smoking ruin, and returned in triumph to their ships."

But at last the bold adventurer fell into distress, and died at St. Domingo, his death serving as a wholesome comment on his life.

"He died so poor, that he did not leave money enough to provide for his interment; and so broken in spirit, that, with his last breath, he entreated his body might be buried in the monastery of San Francisco, just at the portal, in humble expiation of his past pride, 'that every one who entered might tread upon his grave.'"

We must reserve a portion for our next.

Letters and Journals of Lord Byron.

[Second Notice: conclusion.]

SOME of Lord Byron's letters to Mr. Murray are very amusing, and place his liberality, or rather, perhaps, his sense of justice, in a very favourable light; though, in general, we think there are few names introduced into these pages (not excepting the author's own) which are not deteriorated and lowered by the light in which they appear. Speaking of a proposed bargain with Galigiani, he says—

"Recollect that I will have nothing to do with it, except as far as it may secure the copyright to yourself. I will have no bargain but with the English booksellers; and I desire no interest out of that country. Now, that's fair and open, and a little handsomer than your dodging silence, to see what would come of it. You are an excellent fellow, *mio caro Moray*, but there is still a little leaven of Fleet Street about you now and then—a crumb of the old loaf. You have no right to act suspiciously with me, I for have given you no reason. I shall always be frank with you; as, for instance, whenever you talk with the votaries of Apollo arithmetically, it should be in guineas, not pounds—to poets, as well as physicians, and bidders at auctions."

"With regard to the price, I fixed none, but left it to Mr. Kinnaird, Mr. Shelley, and yourself, to arrange. Of course, they would do their best; and as to yourself, I know you would make no difficulties. But I agree with Mr. Kinnaird perfectly, that the concluding five hundred should be only conditional; and for my own sake, I wish it to be added, only in case of your selling a certain number, that number to be fixed by yourself. I hope this is fair. In every thing of this kind there must be risk; and till that be past, in one way or the other, I would not willingly add to it, particularly in times like the present. And pray always recollect, that nothing could mortify me more—no failure on my own part—than having made you lose by any purchase from me."

"So you and Mr. Foscolo, &c. want me to undertake what you call a 'great work?'—an epic poem, I suppose, or some such pyramid. I'll try no such thing—I hate tasks. And then 'seven or eight years!' God send us all well this day three months, let alone years. If one's years can't be better employed than in sweating poetry, a man had better be a ditcher. And works, too!—is Childe Harold nothing? You have so many 'divine' poems, is it nothing to have written a *human* one? without any of your worn-out machinery. Why, man, I could have spun the thoughts of the four cantos of that poem into twenty, had I wanted to book-make; and its passion into as many modern tragedies. Since you want *length*, you shall have enough of Juan—for I'll make fifty cantos."

"Now to business; ***** I say unto you, verily it is not so; or, as the foreigner said to the waiter, after asking him to bring a glass of water, to which the man answered, 'I will, sir,'—'You will!'—G—d—n,—I say, you *must*!' And I will submit this to the decision of any person or persons, to be appointed by both, on a fair examination of the circumstances of this as compared with the preceding publications. So, there's for you. There is always some row or other previously to all our publications: it should seem that, on approximating, we can never quite get over the natural antipathy of author and bookseller, and that more particularly the ferine nature of the latter must break forth."

"You offer fifteen hundred guineas for the new canto: I won't take it. I ask two thousand five hundred guineas for it, which you will either give or not, as you think proper. It concludes the poem, and consists of 144 stanzas. The notes are numerous, and chiefly written by Mr. Hobhouse, whose researches have been indefatigable, and who, I will venture to say, has more real knowledge of Rome and its environs than any Englishman who has been there since Gibbon. By the way, to prevent any mistakes, I think it necessary to state the fact, that *he*, Mr. Hobhouse, has no interest whatever in the price or profit to be derived from the copyright of either poem or notes, directly or indirectly; so that you are not to suppose that it is by, for, or through him, that I require more for this canto than the preceding. No: but if Mr. Eustace was to have had two thousand for a poem on Education; if Mr. Moore is to have three thousand for *Lalla*, &c.; if Mr. Campbell is to have three thousand for his prose on poetry—I don't mean to disparage these gentlemen in their labours—but I ask the aforesaid price for mine. You will tell me that their productions are considerably *longer*: very true, and when they shorten them, I will lengthen mine, and ask less. You shall submit the MS. to Mr. Gifford, and any other two gentlemen to be named by you (Mr. Frere, or Mr. Croker, or whomever you please, except such fellows as your *'s and *'s), and if they pronounce this canto to be inferior, as a *whole*, to the preceding, I will not appeal from their award, but burn the manuscript, and leave things as they are."

"I once wrote from the fulness of my mind and the love of fame (not as an *end*, but as a *means*, to obtain that influence over men's minds which is power in itself and in its consequences), and now from habit and from avarice; so that the effect may probably be as different as the inspiration. I have the same facility, and indeed necessity, of composition, to avoid idleness (though idleness in a hot

country is a pleasure), but a much greater difference to what is to become of it, after it has served my immediate purpose. However, I should on no account like to — but I won't go on, like the Archbishop of Granada, as I am very sure that you read the fate of Gil Blas, and with good reason. Yours, &c."

We select the following for their variety, as well as throwing much light on Lord Byron's character.

"In writing thus to him," says Mr. Moore, "I had more particularly in recollection a fancy of this kind respecting myself, which he had, not long before my present visit to him at Venice, taken into his head. In a ludicrous, and now perhaps forgotten, publication of mine, giving an account of the adventures of an English family in Paris, there had occurred the following description of the chief hero of the tale:

'A fine, sallow, sublime sort of Werter-faced man, With mustachios which gave (what we read of so oft) The dear Corsair expression, half savage, half soft,— As hyenas in love may be fancied to look, or A something between Abelard and old Blucher.'

On seeing this doggerel, my noble friend,—as I might, indeed, with a little more thought, have anticipated,—conceived the notion that I meant to throw ridicule on his whole race of poetic heroes; and accordingly, as I learned from persons then in frequent intercourse with him, flew out into one of his fits of half humorous rage against me. This he now confessed himself, and, in laughing over the circumstance with me, owned that he had even gone so far as, in his first moments of wrath, to contemplate some little retaliation for this perfidious hit at his heroes. 'But when I recollected,' said he, 'what pleasure it would give the whole tribe of blockheads and Blues to see you and me turning out against each other, I gave up the idea.' He was, indeed, a striking instance of what may be almost invariably observed, that they who best know how to wield the weapon of ridicule themselves, are the most alive to its power in the hands of others. I remember, one day,—in the year 1813, I think,—as we were conversing together about critics, and their influence on the public, 'For my part,' he exclaimed, 'I don't care what they say of me, so they don't quiz me.' 'Oh, you need not fear that,'—I answered, with something, perhaps, of a half-suppressed smile on my features, 'nobody could quiz you.' 'You could, you villain!' he replied, clenching his hand at me, and looking, at the same time, with comic earnestness into my face.

"On the day preceding that of my departure from Venice, my noble host, on arriving from La Mira to dinner, told me, with all the glee of a schoolboy who had been just granted a holiday, that, as this was my last evening, the contessa had given him leave to 'make a night of it;' and that accordingly he would not only accompany me to the opera, but that we should sup together at some *caffè* (as in the old times) afterwards. Observing a volume in his gondola, with a number of paper marks between the leaves, I inquired of him what it was? 'Only a book,' he answered, 'from which I am trying to crib, as I do wherever I can; and that's the way I get the character of an original poet.' On taking it up and looking into it, I exclaimed, 'Ah, my old friend, Agathon!' 'What!' he cried archly, 'you have been beforehand with me there, have you?' Though in thus imputing to himself premeditated plagiarism, he was, of course, but jesting, it was, I am inclined to think, his practice, when engaged in the composition of

any work, to excite his vein by the perusal of others, on the same subject or plan, from which the slightest hint caught by his imagination, as he read, was sufficient to kindle there such a train of thought as, but for that spark, had never been awakened, and of which he himself soon forgot the source. In the present instance, the inspiration he sought was of no very elevating nature; the antipathetic doctrines of the sophist in this romance being what chiefly, I suspect, attracted his attention to its pages, as not unlikely to supply him with fresh argument and sarcasm for those depreciating views of human nature and its destiny, which he was now, with all the wantonness of unbounded genius, enforcing in *Don Juan*."

The following is an odd expression of Byron's taste.

"I wish you good night, with a Venetian benediction, '*Benedetto te, e la terra che ti fara!*' 'May you be blessed, and the earth which you will make'—is it not pretty? You would think it still prettier, if you had heard it, as I did, two hours ago, from the lips of a Venetian girl, with large black eyes, a face like Faustina's, and the figure of a Juno; tall and energetic as a Pythoness, with eyes flashing, and her dark hair streaming in the moonlight,—one of those women who may be made any thing. I am sure if I put a poniard into the hand of this one, she would plunge it where I told her,—and into me if I offended her. I like this kind of animal, and am sure that I should have preferred Medea to any woman that ever breathed."

The following are miscellaneous extracts from his lordship's letters and journals.

"Why, at the very height of desire and human pleasure,—worldly, social, amorous, ambitious, or even avaricious,—does there mingle a certain sense of doubt and sorrow—a fear of what is to come—a doubt of what is—a retrospect to the past, leading to a prognostication of the future? (The best of prophets of the future is the Past.) Why is this? or these? I know not, except that on a pinnacle we are most susceptible of giddiness, and that we never fear falling, except from a precipice—the higher, the more awful, and the more sublime; and, therefore, I am not sure that Fear is not a pleasurable sensation; at least, *Hope* is; and what *Hope* is there without a deep leaven of Fear? and what sensation is so delightful as *Hope*? and, if it were not for *Hope*, where would the Future be?—in hell. It is useless to say where the Present is, for most of us know; and as for the Past, what predominates in memory?—*Hope baffled*. Ergo, in all human affairs, it is *Hope*—*Hope*—*Hope*."

"I have been thinking over, the other day, on the various comparisons, good or evil, which I have seen published of myself in different journals, English and foreign. This was suggested to me by accidentally turning over a foreign one lately,—for I have made it a rule latterly never to search for any thing of the kind, but not to avoid the perusal, if presented by chance. To begin, then: I have seen myself compared, personally or poetically, in English, French, German (as interpreted to me), Italian, and Portuguese, within these nine years, to Rousseau, Goethe, Young, Aretine, Timon of Athens, Dante, Petrarch, 'an alabaster vase, lighted up within,' Satan, Shakespeare, Buonaparte, Tiberius, Æschylus, Sophocles, Euripides, Harlequin, the Clown, Sternhold and Hopkins, to the phantasmagoria, to Henry the Eighth, to Chenier, to Mirabeau, to young R. Dallas (the schoolboy), to

Michael Angelo, to Raphael, to a petit-maitre, to Diogenes, to Childe Harold, to Lara, to the count in Beppo, to Milton, to Pope, to Dryden, to Burns, to Savage, to Chatterton, to 'oh have I heard of thee, my Lord Byron,' in Shakespeare, to Churchill the poet, to Kean the actor, to Alfieri, &c. &c."

Speaking of Hunt:

"Now, do you see what you and your friends do by your injudicious rudeness?—actually cement a sort of connexion which you strove to prevent, and which, had the Hunts prospered, would not in all probability have continued. As it is, I will not quit them in their adversity, though it should cost me character, fame, money, and the usual *et cetera*. My original motives I already explained (in the letter which you thought proper to shew): they are the *true* ones, and I abide by them, as I tell you, and I told Leigh Hunt, when he questioned me on the subject of that letter. He was violently hurt, and never will forgive me at bottom; but I can't help that. I never meant to make a parade of it; but if he chose to question me, I could only answer the plain truth: and I confess I did not see any thing in the letter to hurt him, unless I said he was 'a bore,' which I don't remember. Had their journal gone on well, and I could have aided to make it better for them, I should then have left them, after my safe pilotage off a lee shore, to make a prosperous voyage by themselves. As it is, I can't, and would not if I could, leave them among the breakers. As to any community of feeling, thought, or opinion, between Leigh Hunt and me, there is little or none. We meet rarely, hardly ever; but I think him a good-principled and able man, and must do as I would be done by. I do not know what world he has lived in, but I have lived in three or four; but none of them like his Keats and kangaroo terra incognita. Alas! poor Shelley! how we would have laughed had he lived, and how we used to laugh now and then, at various things which are grave in the suburbs!"

"Of Hunt I see little—once a month or so, and then on his own business, generally. You may easily suppose that I know too little of Hampstead and his satellites to have much communion or community with him. My whole present relation to him arose from Shelley's unexpected wreck. You would not have had me leave him in the street with his family, would you? and as to the other plan you mention, you forget how it would *humiliate* him—that his writings should be supposed to be dead weight! Think a moment—he is perhaps the vainest man on earth, at least his own friends say so pretty loudly; and if he were in other circumstances, I might be tempted to take him down a peg; but not now,—it would be cruel. It is a cursed business; but neither the motive nor the means rest upon my conscience."

Curious idea of constancy.

"Six-and-twenty years ago Col. ****, then an ensign, being in Italy, fell in love with the Marchesa ****, and she with him. The lady must be at least twenty years his senior. The war broke out; he returned to England, to serve—not his country, for that's Ireland—but England, which is a different thing; and she—heaven knows what she did. In the year 1814, the first announcement of the Definitive Treaty of peace (and tyranny) was developed to the astonished Milanese by the arrival of Col. ****, who, flinging himself full length at the feet of Madame ****, murmured forth, in half-forgotten Irish Italian, eternal vows of

indolent constancy. The lady screamed, and exclaimed, 'Who are you?' The Colonel cried, 'What! don't you know me? I am so and so, &c. &c. &c.; till, at length, the Marchesa, mounting from reminiscence to reminiscence, through the lovers of the intermediate twenty-five years, arrived at last at the recollection of her *povero* sub-lieutenant. She then said, 'Was there ever such virtue?' (that was her very word) and, being now a widow, gave him apartments in her palace, reinstated him in all the rights of wrong, and held him up to the admiring world as a miracle of incontinent fidelity, and the unshaken Abdiel of absence."

We quote the ensuing as an instance of that moral perversion which was the great ingredient in all Lord Byron's fables.

"You have given me a screed of metaphor and what not about *Pulci*, and manners, and 'going without clothes, like our Saxon ancestors.' Now, the *Saxons did not go without clothes*; and, in the next place, they are not my ancestors, nor yours either; for mine were Norman, and yours, I take it by your name, were *Gael*. And, in the next place, I differ from you about the 'refinement' which has banished the comedies of Congreve. Are not the comedies of *Sheridan* acted to the thinnest houses? I know (as *ex-committed*) that 'The School for Scandal' was the *worst stock piece* upon record. I also know that Congreve gave up writing because Mrs. Centlivre's balderdash drove his comedies off. So it is not decency, but stupidity, that does all this; for Sheridan is as *decent* a writer as need be, and Congreve no worse than Mrs. Centlivre, of whom Wilkes (the actor) said, 'not only her play would be damned, but she too.' He alluded to 'A Bold Stroke for a Wife.' But last, and most to the purpose, *Pulci* is not an *indecent* writer—at least in his first canto, as you will have perceived by this time."

A principle which sets out so erroneously cannot but be false in its conclusions. It seems such a strange rule of action to say, "Because others have done wrong, so will I." Indelicacy was the reigning fault in the ages to which he alludes: such is not the case with ours. It is, we grant, unfair to try these our predecessors by our own rigid rules of decorum; but bad must that taste be which would oppose the opinion of its own time, merely to recall the admitted errors of the past.

We now close these pages. We cannot agree with their palliating sophistry; we think much of their detail had better have been omitted; but we must add, we know few biographical works so full of entertainment and interest. It is a great mental and moral study; but the instruction drawn from it must depend on the reader.

Time's Telescope for 1831. 12mo. pp. 416. Sherwood, Gilbert, and Piper.

Of this, the eighteenth volume of a most useful and entertaining publication, we have to give the same character as of its predecessors: its entire three parts, viz. Almanac of Remarkable Days, Astronomical Occurrences for every Month, and Naturalist's Calendar, are so well compiled, or originally written, as to convey much instruction on these subjects, together with many curious and amusing varieties. In the present instance, we observe also, with satisfaction, improvements in the paper, typography, and illustrations; its arrangement, too, is changed, and probably for the better, as the three series already mentioned may now be read together, without that interruption which occurred on the old plan.

Great labour appears to have been bestowed on the astronomical division of the work, which may be recommended to the youthful astronomer, who finds so much in an ephemeris that is useless to him, or as yet above his comprehension; it is also a suitable companion to the celestial globe, and a guide to the heavens, when a serene sky admits of a survey from the lawn or observatory.

Dr. Lardner's Cabinet Library: Military Memoirs of Field Marshal the Duke of Wellington. By Capt. Moyle Sherer. Vol. I. London, 1831. Longman and Co.

WE are not aware in what particulars this new monthly publication is likely to differ from others already in the field; but we can assure our readers that the first volume is a concise and spirited biography of the Duke of Wellington, from his first commission to the invasion of Portugal by Massena. A second volume is announced to complete the work.

The London University Calendar for the Year 1831. Pp. 264. London, J. Taylor.

WE have here collected into one convenient volume all that relates to the history and management of the London University; such as, its first establishment, the course of studies pursued, and other matters connected with the institution. These are not only interesting to parties concerned in the design, but to the public at large, and especially to those who meditate a resort to the University for the instruction of their children. The outlines of the lectures, &c. are full of sterling information.

Tom Thumb; a Burletta, &c. Pp. 34. T. Rodd.

A REPUBLICATION of this mock-heroic drama, with clever and whimsical designs by George Cruikshank. The tail-piece is a famous flourish.

The Library of Entertaining Knowledge.—The Pursuit of Knowledge under Difficulties, illustrated by Anecdotes. Vol. II. London, 1831. C. Knight.

OUR high opinion of the first volume descends to the second. The pursuit of knowledge is always difficult; and it is delightful to trace the means and the course of those by whom the greatest difficulties have been overcome. It does honour to past generations, and acts as a stimulant to the living race and to futurity. This little volume is crammed with well-chosen and well-digested examples, from remote antiquity to the most recent period; and embraces many subjects truly interesting to the reader, in literature, in the fine arts, in sciences, and, in short, in all that can improve and adorn civilised mankind.

The Royal Lady's Magazine, and Archives of the Court of St. James's. Dedicated, by permission, to the Queen. No. I. W. Sams.

WE are not the best judges of Ladies' Magazines; but the namby-pamby and trash of the old Lady's, rendered it likely that any sort of new Lady's must be an improvement. The portrait of the King is not, however, very good; and the half-dozen other ornaments, together with the literary contents, are so commonplace, or in such bad taste, that we must come to the conclusion of the ploughboy, that these ladies, old and new, are much of a muchness. Poor drivelling work; as if female readers were to be treated like idiots, void of understanding. The editor sets up for a snappish critic too—oh dear!

The Year-Book. By William Hone. Part I. January. T. Tegg.

A VERY entertaining miscellany, with a multitude of curious matters drawn up from the well of antiquity, and skilfully placed in juxtaposition with subjects of the day. It is indeed full of wise saws and modern instances, and well it plays its part among the periodicals of 1831. It is further ornamented with clever wood-cuts, and is altogether highly deserving of public patronage.

Waverley Novels, Vol. XX. The Abbot, Vol. I. Edinburgh, 1831, Cadell and Co.; London, Whittaker and Co.

A NEATLY-WRITTEN preface precedes this volume. Less original than its predecessor, from having to go over the same ground, the preface to the *Monastery* is in reality also that of the *Abbot*. One of the notes we extract.

"All of the same clan are popularly considered as descended from the same stock, and as having a right to the ancestral honour of the chief branch. This opinion, though sometimes ideal, is so strong, even at this day of innovation, that it may be observed as a national difference between my countrymen and the English. If you ask an Englishman of good birth, whether a person of the same name be connected with him, he answers, (if in *dubio*.) 'No—he is a mere namesake.' Ask a similar question of a Scot, (I mean a Scotsman,) he replies,—'He is one of our clan; I daresay there is a relationship, though I do not know how distant.' The Englishman thinks of discountenancing a species of rivalry in society; the Scotsman's answer is grounded on the ancient idea of strengthening the clan."

The frontispiece by Chalon, and engraved by C. Heath, is a fine composition, though we do not fall in love with the countenance of Queen Mary. The vignette by E. Landseer, engraved by W. H. Watt, the dog Wolfe saving the child from drowning, is exquisite.

The Children in the Wood: with Engravings by Thompson, Nesbit, S. Williams, Jackson, Branston and Wright. Drawn on wood by W. Harvey. pp. 15. London. Jennings and Chaplin.

THE most popular of old and popular ballads is here adorned in a manner worthy of its interest. We do not think the art of cutting in wood can go beyond the six prints which so happily illustrate this melancholy tale; and we rejoice to anticipate a series from the "Percy Relics of Ancient English Poetry," ornamented in an equally beautiful and appropriate style. We trust the good taste of the editor will induce him to abstain from facetious prefaces where the selections are of a pathetic nature, like the poor Babes in the Wood. It seems as if in ridicule of the finest sympathies of infancy and youth.

The Sunday Library, Vol. I. Edited by Dr. Dibdin. Longman and Co.

AMONG the numerous libraries, family, national, and encyclopædistic, that periodically issue from the press, for the purpose of putting ignorance to the rout, and filling up the void with useful and economical information in the most agreeable form that knowledge can be conveyed, none are specifically dedicated to the interests of the religious portion of the community. This, when we take into consideration the crying necessity of every effort for the furtherance of the sacred cause being strenuously put forth, has hitherto been no less to be

wondered at than to be lamented. We are happy to say, a work well calculated to inculcate and promote a right feeling, and provide much essential information on the subject of religion, has commenced its course, under the name of the *Sunday Library*, and the auspices of Dr. Dibdin. The object of the work embraces the selection of extracts on the most important topics, from the writings of our eminent churchmen; so that, by the judicious arrangement of these, a plan is struck out, the pursuance of which cannot fail of being an unerring guide, whether of personal edification or family instruction;—on the one hand supplying a corrective to cant, while it furnishes on the other an antidote against infidelity.

Pen Tamar; or, the History of an Old Maid.

By the late Mrs. H. M. Bowdler. 12mo. pp. 244. London, 1830. Longman and Co. We cannot do better than quote part of the editor's preface, by way of review.

"There cannot, surely, be any one in the large circle of her acquaintance, to whom such a memorial of her amiable and pious mind will not be acceptable."

Few persons were more deservedly beloved than Mrs. Bowdler; and we need only add, the present volume is full of the piety and good feeling that characterised her former writings.

ARTS AND SCIENCES.

ZOOLOGICAL SOCIETY.

ON Thursday, J. E. Bichen, Esq. in the chair. Mr. Vigors read the usual monthly report. 2730 persons had visited the Society's gardens during the month of December; and the available balance on that month's proceedings, in favour of the Society, amounted to 524l. 13s. 6d. The Earl of Belfast, Lord Valletort, Sir Philip Egerton, Bart., Sir Thomas Hesket, Bart., Major Carnac, Dr. Blundell, and a number of other individuals, were elected fellows; Captains King, Franklin, and Walker, were severally elected corresponding members.—Amongst the donations to the Society were a variety of curious fishes. A very rare specimen, the *solca pegasus* of Risso, a species inhabiting the Mediterranean, and occasionally taken on the southern coast of England, was presented by Wm. Yarrell, Esq. and was much admired. Some parrots were also enumerated; in the list of these, the ground parrot of Australia appeared to be the most peculiar. Unlike others of the species with which our ornithologists are acquainted, this bird keeps entirely to the ground. After auditors were appointed, one of the fellows gave notice that, at the following meeting, he should bring forward a motion for the erection of a suitable museum. After a protracted discussion, of no interest, the proposed new by-laws were ordered to be hung up in the Society's meeting-room during the following three months. Mr. Vigors informed the meeting that the first fasciculus of the proceedings of the Committee of Science and Correspondence, attached to the Society, was ready for publication.

LITERARY AND LEARNED.

ROYAL ASIATIC SOCIETY.

SIR WILLIAM OUSELEY in the chair.—Professor Reuvens, of Leyden, presented a copy of his Letters to M. Letronne upon some bilingual and Greek papyri, with plates in folio; and M. Adelung, director of the Oriental Institute at St. Petersburg, presented a copy of his Catalogue Raisonné of Sanscrit books and MSS.

—Cavelly Vencata Lutchmiah, a Brahmin, was elected a corresponding member of the Society. Mr. B. H. Hodgson's translation of a Buddhist's confutation of the Brahmin doctrine of caste was read. This is a very curious tract, and is entitled a Disputation respecting Caste by a Buddha, in the form of a series of propositions supposed to be put by a Saiva, and refuted by the disputant; who draws most of his arguments against the divine institution of caste from the Vedas and other sacred books of the Brahmins themselves!

PINE ARTS.

NEW PUBLICATIONS.

Views in the East. From original Sketches by Captain Robert Elliot, R.N. With Historical and Descriptive Illustrations. Part V. Fisher, Son, and Co.

"BENARES," of which it is stated that, as a town to which there is no ruined portion belonging, it is certainly the most interesting and the most remarkable city of Hindoostan over which the English have any authority; "The Cave of Karli," one of those magnificent excavations, the results of pagan superstition, for which India is so celebrated; and "El Wuish," a small harbour on the Arabian or north coast of the Red Sea,—embellish the fifth Part of Captain Elliot's publication. They are from the pencils of Messrs. Boys, Cattermole, and Stanfield; are engraved by Messrs. Heath, Bishop, and Goodall; and are all exceedingly beautiful, especially the last. The descriptions of the Cave of Karli, and of the navigation of the Red Sea by the Arab trading vessels, are full of interest.

Lancashire Illustrated, from original Drawings by S. Austin, J. Harwood, and G. and C. Pyne. With Descriptions. Parts VI. and VII. Fisher, Son, and Co.

THESE Parts complete the work, to which, in conjunction with "Ireland Illustrated," and "Devon and Cornwall Illustrated," we have so frequently called the attention of our readers. We certainly think that the proprietors are justified in the assertion, that the number of its engravings, and the superior manner in which they have been executed, shew that this is a publication of no common character; as well as in their expectation that the patronage which it has hitherto received will be considerably increased, now the volume is complete.

The Duke of Wellington. Moon, Boys, and Graves.

THE illustrious commander on horseback, waving his hat as a signal, from Sir T. Lawrence's grand picture, and nobly engraved by Bromley. It is, altogether, a splendid production of art, and the likeness strong, though treated with the President's usual taste.

ARTISTS' AND AMATEURS' CONVERSAZIONE.

THE third meeting of this Society was held on Wednesday, and was, as usual, very numerously attended by artists and lovers of art. A large collection of paintings, drawings, &c., was laid upon the tables: among them were several of the highest class. Mr. Griffiths, of Norwood (a liberal patron of British art), brought with him a splendid painting of Bonington's,—one of the most exquisitely wrought works of this lamented artist. Many other members contributed extensively to the assemblage: among them we have to notice a study for an infant Bacchus, by Rothwell,—a delicious picture; sketches of female heads and

architectural fragments, by Mr. Parris; about sixty views on the coast of Great Britain, by W. Daniell, R.A.; miniatures of Lord Durham and his son, from the paintings of Sir Thomas Lawrence, by Mr. G. R. Ward; a bust of Dr. Leonard Smith, by Mr. H. Behnes Burlowe; two fine candle-light effects, by Mr. Clater; some sketches from the life, and two highly finished portraits, by Mr. J. Wood; a fine drawing in water-colours of Rebecca, and a miniature of a child, by Miss Fanny Corbux; five sweet drawings, from the tragedy of Juliet, by Mr. J. Hayter; a portfolio of original sketches from nature, particularly in the vicinity of Hastings, by Mr. G. Sydney Shepherd; a series of engravings (fac-similes) of Flaxman's Acts of Mercy, by Mr. G. G. Lewis; an exquisite fancy portrait, and a finely painted head, by Mr. Boxall; a picture in oils—the Bitter Morning,—by Mr. R. W. Bus; a portfolio of sketches, by Mr. Lewis. These were principally the contributions of members, who, we are glad to find, have been induced to consider the exhibition of their works at the meetings of the Society an additional inducement to labour.

We understand that a similar body is about to be formed in the City, and that many of the most wealthy and influential patrons of art, east of Temple Bar, have already expressed a desire to be connected with it. Its results may, and we have no doubt will, be highly beneficial.

SKETCHES OF SOCIETY.

THE REBELLION IN STOCK POGIS.

*Answer to Mrs. Jones's Letter in Hood's Comic Annual.**

Paddington third January 1831.

DR. MRS. JONES,—I take Pin in hand to Scratch you a few Remarks in return for your kind Pestle: it however gav me a seaver Blow to hear of my deer Friends Roofall Sitaway-shun: keep up your Spirits, doe my deer Frend, I dout not in your next I shall hear you have taken to your Old Rum again down stairs and find the Windy-Pains in a Hole condishun—Yet what can you Relie on when the Country Gernals is filled with sheets of Flams of Steaks and Bairns burnt to their foundhayshones. But let you and me Mrs. J, hop that these evil Doors may be sicured. I have a bit of Noose for you—Swing is taken and Lockt up—let us hop then that Steps may be taken for capshining his Canfeedrats—You enquier what our King and Manytirs think of Stuck Puggys I beleeve they think your Magasteearall Funkshun—areas mite have shone more Hacktivity and Incision again armed Poplars and Incinders—but its all owing to the March of Intellx—instd of mindin there work they are always runnin to heer some Seediahus Ourang or other on the Harrastocrazy—they now call themselves the Industrious Classis, formally they was called The Lore Ordurs. My Servint gal attends Love Feasts and Missinarea Meettins and has the impidence to tell me she has a Soal as valleyable as my own and actally askt if her minnyster mite be aloud to come and prepair me for Heavn; but I told the uxyz to prepair herself for another place and gav her a munths warnin to soot herself—but about the parley-meant—Hurl Grey the Primer has a load on is Sholders wich I hop he will be able to discharg an all go off quiet: He has plcdgd himself for to the caws for Rifform an says hell

* Original. See L. G., Review of the *Comic Annual*, No. 736.

Redrench evry Place where he has Grounds: and they all talk about Pooling Measurs; but the Wetterun Bishop Sincurers and Cloaths borrowers show pourfull Oppisishun and perplex and embrace all his Plans—Pettysishuns come in from all Parts for Necromancipation, wick I take to be some new plan for washin the Blackamer wite—also for the vote by Ballad which Mr. Hum supports and likewise Mr. Oonl the Hireish mumber wick wants the Onion to be repeeled and caws all Hireland Watery eyes; but I hop sich Cryses will niver arive—I suppose youve herd Hunt is returned for Prestun wherby Im sorry to heer of a incindery sittin in the ows, for he not only first burnt the Corn but sold it after to the pure People—but is Blackin his good—Our new lord Cancellor Brewem gives us Hops that he will yet a end to all the Old Suits without making any New Breeches wick wrong Incisions wold show Shear hignoranc—but hes no Goos!—Mr. Grant wants to Mancypate the Jews—Porkretchers! my next Nabor Levy says they are a Pussycutish Race thogh they have Numbers of Genesis among them fit for Trusts on Securitys; but let who will be in or out somethin must be done. Winters com and the ole Country wants instant Releashing thogh I hop no Treasonable acts will be manny fisted be the People—Nobody now cant sell nothing Goods hangs on hand and Malefactors are dropping in every line—Soverins is scars and Peoples ready to tear each other to peeces for um—We want some change—In the Naborhood of Manahister thirty thousn Wafers are in a state of Rliability which is no laughin matter, havin struck for more Wags tho' they get therty shillins aWeak and are always in labor!—this abolition of feelin shold be chekt, for if it is to go on it will most likly costinew—As you observe, the Rag for Chang is grate—as they say The Scullmasters Abroad and the Scull all in confushon—Old Head devices done away with and Hairy Casles supplyin the place—Aspics on the Continence seem very embracing—tho the Trials in France is over the People are in Truble—I hope the Rising in the Low Kantry is over—The Poles seem to be makin head again the Rushons in great Armd Bodis—bent on Deth or imprisonment to get Liberty—In shorth all Eurups in Harms; but nothins so Barberus as Civil conoshins Hopin all is over with You, and resin assahurd Stuck Puggys is not likly to rie again, I conclude remaining Your sincer Fread and well wisher A HUMPHRIES.

DRAMA.

OLYMPIC THEATRE.

THIS now beautiful little theatre opened its doors on Monday evening last to as eager and zealous a crowd as we ever witnessed in the pit-going days of our youth, when to be squeezed as flat as a pancake was considered as one of the principal delights of the evening. About ten minutes past seven the curtain rose, and Madame Vestris made her courtesy amidst deafening acclamations. It was some time before silence could be obtained, and during this period she appeared labouring under excessive emotion. Order at length being restored, she spoke an occasional address, written by Mr. J. H. Reynolds. It is full of point and pleasantry, and was received with considerable applause. "God save the King" followed, the solo parts being sung by Messrs. Spagnoletti and Hodges (pupils of the Royal Academy) and Madame Vestris. The first burletta of the evening, entitled

Mary Queen of Scots, though new to the metropolis, has been sometime a favourite in the provinces, and is adapted from Sir Walter Scott's novel of the "Abbot," by Mr. Calcraft, the manager of the Dublin theatre. Miss Foote sustained the character of *Mary*, for the first time. Her reception was most flattering. She was respectfully supported by a Mr. Fredericks, in the part of *George Douglas*; and a young lady named Langley sang a ballad with much sweetness and feeling. Mrs. Knight, late of Drury Lane, played *Lady Douglas*; and in *Catharine Seyton* we recognised the pretty little dark-eyed Miss Pincott, from the same establishment. After *Mary Queen of Scots*, a new and very appropriate *jeu d'esprit* was performed, the joint production, we understand, of Mr. Planché and Mr. C. Dance. It is of the *Midas* genus, and founded on Mr. Colman's whimsical version of the story of "Pandora." The curtain rises on an "Olympic game at whist." *Jupiter* holds bad cards, and is annoyed by bad jokes, and breaks up the party in a huff. He calls for music, but *Apollo* is at a glee-club. He inquires for *Bacchus*; he is in the chair at the Punch-bowl, and not presentable—*Mars* is at drill—*Momus* "eating fire at Troy fair"—*Esculapius* has been suddenly sent for to bleed king Priam—*Somnus* is "yawning o'er the last new play"—and *Juno* is in the laundry; "tis washing day!" *Mercury* is eventually sent on a message to *Vulcan*, respecting "the lady" ordered by *Jupiter*, and returns with an answer from the "lame old tinkler," promising his speedy appearance with his work. *Bacchus* is now brought home by *Pan* and *Silenus*, "so drunk he cannot sit his barrel, without being held there." *Momus* enters to the laughing chorus from *Der Freyschiitz*; and *Apollo* also making his appearance, *Jupiter* prepares for frolic, when his thoughts are recalled to business by the ascent of *Vulcan* with his "lass of mettle!" she is pronounced a *chef d'œuvre*, and *Vulcan* tenders "his little bill." The deities then proceed to bestow their various presents on the stranger. Love animates and music instructs her; and health, wealth, lasting charms, and endless mirth, are promised, in appropriate airs, by their respective divinities. *Jupiter* then names her *Pandora*, and presents her with the famous and fatal box. She is about to descend to earth in the care of *Mercury*, when *Juno* enters in a rage, and, after a laughable altercation with the king of gods and men, bestows on *Pandora* "woman's dear passion, curiosity." The gods go to dinner, and *Mercury* and *Pandora* seek the abode of *Prometheus*. A Swiss milk-boy—"a great anachronism," according to the bill, meets with them, and is told by *Mercury* that the lady is a star who is thither flown,

"To light a little system of her own—
Feeling her way, twinkling 'midst hope and doubt:
Who would be the man to put her out?"

The gallant milk-boy declares he would not, and assures them that he bears

"The milk of human kindness."

These sallies were received with shouts by the audience. The rest is soon told. *Prometheus* receives the lady with delight, but his ardour is a little damped by the discovery that she has no luggage except a little box. He leaves her for a moment, and, mastered by her curiosity, *Pandora* lifts the fatal lid. "Envy, hatred, malice, and all uncharitableness," issue from the box, amidst discordant crashes. *Prometheus* enters in dismay; and the vengeful Thunderer appearing, condemns *Pandora* to die an old maid, and inflicts on *Prometheus* "a liver complaint,"

in the classical form of a hungry vulture. Wisdom, however, prompts *Pandora* again to examine the box: *Hope* is discovered at the bottom; she advances, leaning on her anchor, and, after propitiating *Jove*, intercedes with the audience for "*Prometheus* and little *Pandora*." We need scarcely add that her intercession is effectual. Madame Vestris's delicious voice is heard to great advantage in this little theatre, and she enacted the part of *Pandora* with all her accustomed grace and spirit. Her gradual animation in the first scene is admirably expressed. Mr. Cooper, as *Prometheus*; Mr. T. Knight, as *Jupiter*; Mr. Newcombe, as *Mercury*; and Mr. Beckwith, as the *Swiss Boy*—exhibited considerable humour. Madame V. was called for at the conclusion, and announced the *Olympic Revels* for repetition every evening. We have no doubt of its running the whole season. The performances concluded with the *Little Jockey*, alias *Youth, Love, and Folly*; and *Clarissa Harlowe*, alias the *Old Maid*. One piece too much perhaps: but, as Miss Foote played in one, and Mrs. Glover in the other, we could scarcely make up our minds to spare either.

THEATRES AND THEATRICAL PROPERTY.

As we are probably on the eve of a decision on the question of theatrical patents, or monopoly, which will put the stage upon a new, and we trust a better footing, it may not be amiss to throw our contribution into the general data, though we have for years, upon insulated points, said all that we can say on the question, and especially in our No. 569, Dec. 15, 1827, pointed out what we deemed a remedy for the evils most felt.

The drama is far gone in a decline, and neither authors nor actors can cure it.

The large patent theatres have been mere wild or sordid speculations, and withal unprofitable, since we remember them.

The minor theatres have, accordingly, been gradually creeping on. Some have been prosperous, and others have been bankrupt, simply because they deserved no other fate, either from the principle on which they went, or the management by which they tried to gull the town.

The competition, as carried on, has been disgraceful, as well as ruinous, to all parties; and has utterly prevented excellence in any branch of the drama.

What we recommended was, to limit different houses to different species of entertainments,—tragedy, comedy, and farce here; opera there; spectacle, melodrama, or vaudeville, at other places. Then should we see good companies for all, instead of mixed companies fit to execute nothing perfectly.

But we are not now going again into the general question, which would lead us into the folly of the present licensing system: we would rather put in our word on the specific matter to be immediately decided, and on which the fate of English opera depends. London is the only capital in Europe which does not enjoy an opera in the native language; and that which has the foremost privileges every where else, is with us the least favoured of the drama. Surely, Mr. Arnold, who has done so much for the improvement of our national music, ought to have every encouragement to pursue his laudable course,—such as length of season, and at times when the town is full—facilities for rebuilding his theatre, and a convenient site; in short, the most liberal patronage of every kind. We trust he will have all this: we are sure his efforts have deserved it.

The Jeu d'Esprit. Published by E. Wallis.

A NEW game, and a nice amusing trifle for the holidays. It possesses the merit of being simple and easy for young folks; and is, besides, quite a novel way of introducing them to an acquaintance with the best authors, whose pictures, and quotations from their works, form the playing cards. The game ends rather abruptly, and depends on chance; still, we would recommend it especially to family and youthful circles. It is the invention of a very active-minded individual, Mr. F. W. N. Bayley; to whom we are indebted for the game of "York and Lancaster;" for a great deal of pleasing lyrical composition; and for a clever work on the West Indies.

But apropos of the *Jeu d'Esprit*. In unison with its name, and to try its merits in another way, we asked a remarkably ingenious child, the other night, what he thought of some of the pictured authors. The following was part of our colloquy, and if mamma's pet does not turn out a punster, then have we no skill in phrenology.

Q. What do you think of Swift? A. That he must have run better than any body else! Of Young? That he was like "procrastination." How do you mean? "The Thief of Time!" (This is the apposite quotation on his card.) Of Congreve? A. A rocket! better than

To wield the sword, to hurl the pointed spear,
To stop or turn the steed in wild career.

Of Spenser? That he could not be a Turncoat. Of Raleigh? I don't know. Of Cowley? He should have been a pastoral poet. Of Steele? That he was, nevertheless, no Plagiarist. Of Milton? That he was not a mute inglorious Milton—oyster. Of Bacon? That he is one of the *have-beens*.

We could stand it no longer; and giving the precocious brat a cuff, we dismissed him to his admiring mamma.

The Game of the History of France, from Pharamond to the Accession of Louis Philippe I. London. E. Wallis.

THIS is one of the ingenious and pleasing devices by which historical knowledge is infused into the young, by means of an apparent (and indeed real) amusement,—a pack of cards and set of counters so constructed as to afford the players a fair insight into French history, and at the same time exercise their memory and faculties. We recommend the game heartily.

VARIETIES.

Danish Army.—The military education of the soldiers and subalterns of the Danish army has long been carefully attended to; but there has been no school for instruction in the higher branches of military knowledge. That want has been recently supplied by the establishment of a school at Copenhagen, founded and supported by the king; the pupils of which are to go through various courses, the duration of which is fixed at four years.

Paris.—Politics usurp almost the entire atmosphere of Paris, and we read fifty journals without acquiring one paragraph of literary or scientific intelligence. We observe with satisfaction, however, that these amenities are not altogether abandoned. M. Cuvier and Le Duc de Luynes have just been elected honorary members of L'Académie des Inscriptions et Belles-lettres. At the meeting of the Académie des Sciences, of the 15th November (the latest reported) the principal paper read was one by M. Geoffroy Saint Hilaire, on some parts of the organisation of kangaroos and other animals which have bags or purses.

Berlin.—Mila's recent account of the origin, progress, and actual state of the Prussian capi-

tal, corrects a common error as to its foundation; and assigns it, not to the year 1160, but to the interval between the years 1202 and 1220, when Albert the Second held sway. The same work mentions that in 1640 the population of Berlin did not much exceed 6000 souls; in 1688, they amounted to 20,000; and at the beginning of the eighteenth century, to 30,000. In 1687, the king's library had already accumulated 1618 MSS., and 20,600 volumes; but in 1827 the collection had grown to 4611 MSS. and 250,000 printed books. Adverting again to the population, we add, that in 1713 it had risen to 50,000 souls; in 1741, to 90,000; in 1773, to 133,580; in 1797, to 183,960; and in 1827, to 220,277, who were housed under 13,511 roofs.

New Telegraph.—It is proposed to establish in France public telegraphs, for the conveyance, throughout the kingdom, of communications between merchants and other persons. A new telegraph, consisting of four lamps, and of course capable of being worked day and night, has lately been invented for the purpose. By a recent experiment, it appears, that in ordinary weather, this telegraph can communicate between three and four signals a minute; that is to say, above two hundred an hour. Two hundred signals comprehend above five hundred words. It is practicable, therefore, to forward, in an hour, at least ten communications, each of twelve or fifteen words; a number sufficient for important intelligence, when brevity is indispensable.

Naples.—By a recent census, published under the direction of the Abbé Petroni, it appears, that in a population of 5,456,664 persons, which is that of the kingdom of Naples, there are 37 above a hundred years of age, 93 prelates, 27,912 priests, 8456 monks, and 8185 nuns. It also appears, that the city of Naples contains 340,190 inhabitants, 3 cardinals, 1 archbishop, 8 bishops, 1751 priests, 610 monks, 827 nuns, 18,100 state-pensioners, 9450 persons in public offices, and 114,519 workmen: 1627 persons are employed in the business of education, from the academicians down to the masters of schools for infants.

Tehuantepec. The 87th No. of the *Bulletin de la Société de Géographie*, of Paris, contains an important article in the shape of a reconnaissance of the Isthmus of Tehuantepec, made by the engineer-general of brigade, D. Juan Orbegoro, in conformity with the orders of the Mexican government. The result is, however, by no means favourable as to the practicability, so frequently discussed, of forming a navigable canal for the passage of vessels from the one sea to the other.

Longevity.—Russia is the country for wonderful longevity. In the year 1827, there died in Russia 947 persons above a hundred years old, 202 above 110, 98 above 115, 52 above 120, 21 above 125, and 1 above 135!

The Creation of the World.—The *Russian Almanac* counts 7338 years since the creation of the world.

Saw-Mills.—There are in St. Petersburg three saw-mills worked by steam; two belonging to individuals, and one to government. In the course of the year 1829, these mills turned out 456,326 planks of various kinds.

Prussian Periodical Literature.—In the seven provinces of which Prussia is composed, there are published no fewer than 262 periodical works. Of these 27 are political gazettes, 60 scientific journals, 55 advertising sheets, 100 purely literary, 10 devoted to religion and ethics, 3 legislative, 3 journals of the arts, and 4 agricultural and technological.

Extraordinary Productiveness.—In the month of September, there were sown, in a garden near Silberberg, in Silesia, 287 grains of wheat. At the ensuing harvest they actually produced 117,644 grains, fully and perfectly matured! There were two ears, amongst the rest, one of which contained 1055, and the other 1077 perfect grains. The longest halm measured six feet two inches in length, inclusive of the ear, and some of the leaves were two feet and more in length.

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. 11. Jan. 2.]

A Description of a Patent Metallic Lining and Damper for Chimneys, for the purpose of rendering them Fire-proof, and also superseding the practice of employing Climbing-boys.—The Shamrock, a Collection of the best Irish Songs, Serious and Comic, many of them never before in any volume, edited by Mr. Weekes, of Drury Lane.

TO CORRESPONDENTS.

Parry Parry will not do for us. Album verses rarely, if ever, mend by publication.

The individual who calls upon us to review a "History," must send it. We have long found out, that what was not worth sending to a Journal like ours, was not worth seeking; and we have many interesting works before us, to which we can barely do justice.

Our "Friend" N. does not seem to be aware that the mere notice of a book in three or four lines, is the result of, perhaps, more hours, and sometimes days', consideration. The publications most eligible for extract are not (it may be) those which require our greatest attention;—on the contrary, we often expend much of comparison and research on a subject which only occupies a few lines; while on attractive, temporary, and, from their character, popular works, we can afford to be fully explanatory at a very small expense of thought. We hope, therefore, not to be judged by quantity, but by quality.

We are again obliged to postpone our note on Mr. James's letter.

We are sorry that we have not space to devote to the controversy which Mr. T. Price's second letter must provoke. We insert his opinion, that no physiologist will be able to adduce the slightest authority, either ancient or modern, in support of the principle that a dark complexion is a decisive mark of Celtic origin; but, on the contrary, that the whole can be proved to be nothing else than an utter fallacy, founded upon mere gratuitous assertion.

The plan of Swing-Town, which our respectable correspondent wishes us to engrave, is really such a stretch of philanthropy, that we could hardly help laughing at the idea. To choose a beautiful, picturesque, and fertile country, the finest part of New Holland, and to build individuals convicted of machine-breaking and incendiarism, together with their families, seems to us to be rather a provocative to crime. And the expense of transport, &c. &c. &c. would be enormous.

ERRATUM.—In the poetry, "Tempus fugit, et tempus non fugit," a fortnight ago, the lines *Tempus fugit* and *Tempus non fugit*, through the carelessness of the writer, and owing to inadvertence on our part, were transposed.

ADVERTISEMENT,

Connected with Literature and the Arts.

SLATE GLOBES.—The Inventor begs leave to draw the attention of those engaged in teaching to these Globes, as being eminently calculated for Geographical and Astronomical exercises, possessing very superior advantages; as from their Globular form, a more correct idea of the relative situation of countries, &c. is to be attained, than is possible from a plane surface. The materials and the construction are permanently drawn. The surface is precisely similar to slate, and is marked on with the common slate-pencil.

Sold by C. Smith and Son, 179, Strand.

* Globes exchanged and lent on hire. Several pairs of Second-hand Globes at a considerable reduction.

THE COURT JOURNAL enlarged, without increase of Price.

The great and increasing success of the Court Journal has induced the Proprietor to spare no expense in meeting the many new claims which the existence of the New Court has put forth on the space and attention of the Journal. Accordingly, new arrangements have been made, by which, in the first place, the reader will get twice the amount of original matter in each Number, and, in the second place, new and exclusive sources of information have been opened and secured in connection with Court and Fashionable Life; and new and sure means have been adopted for obtaining early political information of a kind and character inaccessible to any other weekly Journal.

N.B. The first Number for 1831 contains, among other articles of peculiar interest, a Second Part of the Garland of Beauty, a paper which, in the publication of the First Part, excited so much attention, as to call for the reprinting three several times of the Number in which it appeared.

Among the distinguished Names who figure in this ingenious production are—Her Majesty—The Princesses Katherine and Louise—The Duchesses of Gordon and Canizarro—Marchionesses of Sills, Ormsley, Salisbury, Westmoreland, Hertford—Countesses of Chesterfield, Jersey, Sheffield, Kinnaird, Clanwilliam, Wilton, Cork, Warwick, Denbigh, Normanville, Darvelmouth, Claremont—Ladies Egerton, Tullamore, Kildere, Foley, Rathven, Combermere, Sidney, Poulet, C. Lowther, E. Ashley, C. Nugent, Somerset, F. Normanby, Walsh, Ryder, H. Wallcut, Broadham, W. Woughy—Mrs. L. Litchton, Peel, Petre, Goulbourne, Throgmorton, Wickham, Fox Lane, Stanley, Parmer, Byng, Dundas—Misses De Roo, Bayle, Bagot, Meade, Cadogan, Edwards, Falding, Burdett, &c. &c.

The Court Journal is published every Saturday Morning, and sent by the Newsmen, free of postage, to all parts of the Kingdom. Office 19, Catherine Street, Strand.

THE UNITED SERVICE JOURNAL, enlarged for January, 1831, price 6d. contains—

1. *Reveries of Miles Minden and his Friends*. No. 1.—2. *Some Remarks on the Ships of the Ancients*.—3. *The New Year: A Naval Allegory*.—4. *Newcome's Journey to Head Quarters near Bargo*.—5. *The Young Soldier's Farewell*.—6. *Journal of the Surveying Expedition*, composed of his Majesty's Ships Beagle and Adventure, concluding Hercules, Phoenix, and the Day before the Entry of the Dutch Troops into Brussels. 7. *Letters from Gibraltar*. No. VII.—8. *A Recollection of the Old School*, by a Greenwich Pensioner. 9. *Denominations of Modern Shipping*. 10. *The Last Miles*.—11. *White Squall off the Chesapeake*, by an Officer on board a British Frigate. 12. *Harpoon revisited*, by an Officer of the British Guards. 13. *On correcting the Course in the Day's Work*, by Lieutenant Raper, R.N.—15. *Some Thoughts on the General Principles of Field Manœuvres*.—16. *Condor Shooting in Peru*, addressed to Christopher North, Esq.—17. *Elegy*, by a Half-pay Officer. 18. *Critical Account of Lord Dorchester in the War of 1778*.—19. *War Game of Prussia*.—20. *Poland as it is*; by a Polish Nobleman. 21. *Biographical Memoirs of Captain the Hon. Sir Robert Spencer*, R.N. R.C.H. 22. *Circular System of Fortification*.—23. *History of the Polish Legation under Buonaparte*.—24. *On Outpost Duties and Patrolling*.—25. *General Correspondence*, in which will be found a considerable increase to the usual number of Letters on a great variety of subjects connected with the interests of the United Service. 26. *The Editor's Portfolio* and Naval and Military Miscellany. 27. *Courts Martial*. 28. *Naval and Military Promotions*, appointments, &c. 29. *Distribution of the Entire Army on the 1st of January, 1831*. 30. *Abstract of Parliamentary Debates*, General Orders, Circulars, &c. 31. *A Tabular View of the Privy Pensions*, &c. of the Officers of the British Army, Births, Marriages, and Deaths, Notices to Correspondents.

Henry Colburn and Richard Bentley, New Burlington Street.

MUSIC.

NEW VOCAL MUSIC—the Words selected, by permission of Mr. Murray, from "Moore's Life of Lord Byron"—the Music composed by Henry R. Bishop, Dr. John Clarke, Charles E. Horn, and G. Kilmack.

Days of our Glory.....	20	My Sister, my sweet Sister.....	20
Friendship is Love.....	20	Those flaxen Locks.....	20
Hills of Annesley.....	20	We'll go no more a-Roving.....	20
Memory.....	20	Young Oak.....	20
My Bent is on the Shore.....	20	Young Friendship.....	20

Sacred Songs.

The Embellishments by L. Haghe, G. Childs, Sharpe, &c. &c.

R. Ackermann, 96, Strand.

BOOKS PUBLISHED THIS DAY.

INTRODUCTIONS TO THE STUDY OF THE GREEK CLASSIC POETS, for the Use of Young Persons at School or College.

By HENRY NELSON COLERIDGE.
"Mr. Coleridge has done himself infinite credit by this little volume, which displays striking proofs of judgment, learning, and good taste. It is designed for the use of young persons at school or college, though, in truth, it may be used with advantage by persons of all ages. The volume is the only first of a series intended to be published from time to time."—*Sun*.
John Murray, Albemarle Street.

4s. 6d. bound and lettered.

THE HISTORICAL MISCELLANY.

By W. C. TAYLOR, A.M.
"This is an instructive volume for the youthful student, intended as a Supplement to Finlson's *Grecian, Roman, and English Histories*. The first half of the volume is occupied with the primeval and classical periods; in which the author has particularly directed his attention to those branches of history on which school-books are frequently deficient, although directly illustrative of the general course of study. Among these topics may be instanced, the Persians and Carthaginians, the antagonists and rivals of Greece and Rome. In the modern division special attention is paid to the Feudal System and the Crusades, and afterwards to the English empire in India, and British commerce in general. Then follows a series of British biography; and, in conclusion, a view of the British constitution. Prefixed to the volume is a union map, exhibiting, in one sheet, the ancient divisions of the world in red, and the modern in black—an ingenious and very useful plan."—*Gentleman's Magazine*.

Printed for Whittaker, Treacher, and Co. Ave Maria Lane.

By the same Author,

History of France and Normandy, from the Accession of Clovis to the Battle of Waterloo. 18mo. 6s. bound and lettered.

May be had, gratis,

Whittaker and Co.'s New School Catalogue.

THE YEAR-BOOK.
With Engravings, Part I. price 1s. and No. 1. price 2s.

An entirely new Publication in Monthly Parts and Weekly Numbers; on the plan, and in the manner, of the "Every-Day Book."
"Many things for use, several things worth thinking over, various articles of much amusement, and nothing that I have brought together before."—*See Preface to the Part I.*
Printed for Thomas Tegg, 78, Chesham; and sold by all Dealers in Books.

The Rick-Burners.

Price 4d. 6th edition of

THE RICK-BURNERS; a Tale for the Present Times.

"The Rick-Burners" ought to be liberally distributed among the poorer classes in every town and village in the kingdom, by those who are able and wish well to their country. We trust clergymen, magistrates, landlords, and the wealthy generally, will look at this little work, and spread it where it may bring forth salutary fruits."—*Literary Gazette*, Nov. 30th, 1830.
London: HURST, CLARKE, & CO. Cowtan and Co. Canterbury; and sold by all Booksellers in the Kingdom.

THE BRITISH CRITIC—QUARTERLY THEOLOGICAL REVIEW—AND ECCLESIASTICAL RECORD.

Contents: Scripture Revelations concerning a Future State—Dr. Burton's Bampton Lecture—Cambridge Transactions; Science of the English University—Burchard's Notes on the Beotons and Wabays; and Arabic Proverbs—Miller's Sermons—Coleridge's Introduction to the Greek Classic Poets—Bishop Sandford's Diary and Correspondence—Lyle's Principles of Geology—Bishop of London's Charge—Reasons for seceding from the Dissenters—Bishop of Exeter's Charge—State of the Dioceses in England and Wales—Proceedings of the Universities.
Printed for C. J. G., and F. Rivington, St. Paul's Churchyard; and Waterloo Place, Pall Mall.

THE POCKET ALBUM AND LITERARY SCRAP-BOOK; containing a variety of Articles by talented living Writers, and embellished with a Portrait of Lord Brougham, engraved on steel, from a Likeness taken expressly for this Work; and Thirty other Engravings, price 6d.

The Parisian Gem of Fashion; with Four coloured Prints of Paris Costumes—An Original Letter from Paris on State of Society and Fashions in that City—and various other Articles, price 6d.

The Lady's Pocket Magazine; embellished with a splendid Engraving on steel of the Tame Robin, from a Design by H. Singleton, R.A., Woodcut; and Two coloured Plates of London Fashionable Costumes, price 6d.
To Country Booksellers.—That every person may have an opportunity of inspecting the merits of the Publications, the Trade are informed that they may order the Numbers for the present Month, and at any period during the Year return whatever may remain unsold.

Shew-boards and Prospectuses may be had on application by letter, post-paid, or through any London Correspondent, to the Publisher, J. Robins, Bridge Court, Bridge Street, London.

TREATISE ON FEVER.

In 8vo. price 14s. cloth boards.
By SOUTHWOOD SMITH, M.D.
Physician to the London Fever Hospital.

Printed for Longman, Rees, Orme, Brown, and Green, London.

"This Treatise on Fever stands without competition, at the head of all that has been written on this abstruse disease."—*Westminster Review*, Jan.

"There is no man in actual practice who should not possess himself of Dr. Smith's work."—*Lond. Med. and Surg. Journal*, February.

"The general reader will find it perfectly intelligible, and of great practical utility."—*Monthly Repository*, March.

"With a mind so trained to accurate observation and logical deduction, Dr. Smith's delineations are peculiarly valuable."—*Medico-Chirurgical Review*, March.

"Of the morbid phenomena he has given a most masterly description."—*London Medical and Physical Journal*, March.

"The author merits the reward of a double service, by arriving at important truth amid much popular error, and by laying the truth before the world in a didactic, and with a demonstration, which most powerfully recommend it to the judgment."—*Westminster Review*, April.

"The work just analysed is the best which we have ever perused on the subject of fever, and in our conscience we believe it the best that ever flowed from the pen of physician in any age or country."—*Medico-Chirurgical Review*, April.

Crown 8vo. 12s. bound in canvas.

A SHORT HISTORY OF SPAIN, for

Young Persons.

By MARIA CALLOTT.

With Wood Engravings.

John Murray, Albemarle Street.

Logan's Highlands and Highlanders.

In 2 vols. demy 8vo. price 30s.; royal 8vo. price 2l. 2s.

Dedicated, by permission, to His Majesty,

THE SCOTTISH GAEL; or, Celtic

Manners as preserved among the Highlanders. Being

an Historical and Descriptive Account of the Inhabitants, Antiquities, and National Peculiarities of Scotland; more particularly of the Northern, or Gaelic parts of the Country, where the singular Habits of the Aboriginal Celts are still most tenaciously retained. Illustrated by upwards of Sixty descriptive Plates, and accurately coloured Engravings of the Costumes of the Highland Clans; with correct Specimens and Descriptions of their respective Badges, Tartans, &c. &c.

By JAMES LOGAN,

Fellow of the Society of Antiquaries of Scotland.

This Work may be justly designated "The Celtic Cyclopædia," as every thing connected with the History of the Ancient and Modern Gael, and the different branches of the same Race, in the British Isles, and elsewhere, is minutely described, illustrated, and traced to the primitive Inhabitants of Western Europe.

"Mr. Logan has acquitted himself loyally to his country, and faithfully to literature—his work bears in every page the unequivocal evidence of observation and research. To all Scotchmen and lovers of Scotland—to every inquirer into the history of man—we recommend Mr. Logan's book."—*Athenæum*.

"Mr. Logan's work will have the good effect of clearing up many doubts, and of shewing the Celtic and Lowland races in a more distinct light than they have hitherto been relatively placed; it possesses also the merit of being accurate, patient in details, highly descriptive, and always entertaining. Wherever there is any uncertainty, the book prevails to the character of a library, this History of the Scottish Gael should be added to it without loss of time."—*Atlas*.

"A production of much research and ability, and replete with interesting investigations into our northern antiquities. It deserves the warmest patronage of the public, as a most meritorious, curious, and sterling performance."—*Literary Gazette*.

Thaddeus of Warsaw. A New Edition.

The 11th edition, in 3 vols. 18s.

THADDEUS OF WARSAW.

By MISS JANE PORTER.

"Miss Porter has availed herself of a very interesting period in history for the foundation of her tale. Often have we felt our heart rent by indignation and pity at the dismemberment of Poland, and the cruel fate of Stanislaus. Truth and fiction are blended with most propriety in these volumes; and we have turned with sincere pleasure to the pages that praise the valor of Kosciuszko, and record, though but as a novel, the adventures of Sobieski."—*Critical Review.*

Printed for Longman, Rees, Orme, Brown, and Green.

 7. Letters on Entomology.
In 8vo. 8vo. with 4 Plates and a Map, 7s. in cloth.
 8. Stories of Travels in South America.

THE NEW MONTHLY MAGAZINE.

A retrospect of the progress of the New Monthly Magazine during the present year, has been a source of gratification to its proprietors; but, although they hope and believe that no permanent defect has existed, they conceive that the work may be improved by adding one or two new features to those by which it is already distinguished, and by increased activity in the present management.

The New Monthly Magazine will therefore commence the year with several changes, which the public support it has so long enjoyed. Among other improvements, it is the intention of the Proprietors to introduce into the Magazine a series of Literary Notices, or estimates of the genius of the principal authors of the present day, accompanied by engraved likenesses. As, in the course of intellectual culture, the series must include many names comparatively new to fame, the plan must be admitted to possess some novelty.

The Proprietors pledge themselves to the most unremitting efforts to secure the co-operation of the most successful writers of the day, and the contributors may be assured of being treated with the most perfect freedom from any restraint in conveying their opinions to the public.

With regard to the Politics of the Magazine, the Proprietors do not think it necessary to state that it will persevere in the course it has so long and so variably maintained. Its sentiments generally accord with those of the individuals who at present influence the destinies of the country, it is because the government has happily taken the form which, for years, has been contained in the pages of the New Monthly Magazine as most congenial to the best interests of Great Britain. It is, however, to be remembered that the support will be extended to it will not be the advocate of such principles as are consistent with reason and experience, and have the sanction of the great mass of all nations. The sentiments of the great mass of the people will be echoed freely and boldly, influenced by no other considerations of expediency or expediency.

The First Number for the New Year will be published on the 1st of January; and those who desire to avail themselves of the opportunity for commanding the Work, are requested to transmit their orders to their respective Booksellers or Newsvendors.
Printed for Henry Colburn and Richard Bentley,
New Burlington Street.

FRASER'S MAGAZINE for TOWN and COUNTRY, price 2s. 6d.

15. Hon. Agar Ellis's True History of the Men in the Iron Mask. 10s. 6d.

16. The Gold-headed Cane, in post 8vo. 10s. 6d.

17. Bertha's Visit to her Uncle in England, new edition, 3 vols. only 10s. half-bound.

18. Mrs. Markham's History of England for Young Persons, with Wood Engravings. 3 vols. 18mo. 12s.; and History of France, 2 vols. 15s.

19. History of Spain, upon the Plan of Mrs. Markham's Histories. By Mrs. Calcott. 3 vols. 15s.

20. Stories from the History of England, for Children, 10th edition, 3s. half-bound.

21. Death-bed Scenes and Pastoral Conversations, 4th edition, printed to correspond with the Family Library. In 3 pocket vols. price only 12s.
John Murray, Albemarle Street.

OBSERVATIONS on FOSSIL VEGETABLES,

accompanied by Representations of their Internal Structure, as seen through the Microscope, (12 Plates, engraved by Mr. Lizar, from Drawings by Mr. McGillivray).
By HENRY WILKINSON, Esq. of Lartington.
Fellow of the Geological Society of London, of the Royal and Wernerian Societies of Edinburgh, &c. &c.
Printed for William Blackwood, Edinburgh; and T. Cadell, Strand, London.

TRAITS and STORIES of the IRISH PEASANTRY,

containing Ned McKean—the Three Tacks, or the Little House under the Hill—Shane Padri's Wedding—Larry McFarland's Wake—the Battle of the Factions—Funeral and Party Fight—the Hedge School—the Abduction of Mai Kavanagh—the Station.
"Admirable, truly intensely Irish. Never were the outrageous whimsicalities of that strange, wild, imaginative people, so characteristically described; nor in the midst of all the fun, frolic, and folly, is there any dearth of poetry, pathos, and passion."—*Blackwood's Magazine*.

"Neither Miss Edgeworth, nor the author of the O'Hara Tales, could have written any thing more powerful than this."—*Edinburgh Journal*.

"We do not hesitate to affirm, that one of the cleverest and most lively sketches in literature may be found in the tale of 'Larry McFarland's Wake.' It has the moral truth of the Cottagers of Glenburnie, with the pathos of Mrs. Ogle, and the characteristic traits so forcibly drawn by the creator of Ahy Newland."—*Spectator*.

Dublin: Printed for W. Curry, Jun. and Co. Sold by Harst, Chance, and Co. London; and all other Booksellers.

M'COLLOCH'S POLITICAL ECONOMY. A new edition, greatly enlarged and improved, in 1 large vol. 8vo. 16s.

No. 730.

SATURDAY, JANUARY 15, 1831.

PRICE 8d.

REVIEW OF NEW BOOKS.

The Siamese Twins. By the Author of "Pelham," &c. &c. 8vo. pp. 390. London, 1831. Colburn and Bentley.

Of this varied and remarkable poem it is not our purpose, in our present No. to give an analysis; or even to pronounce a detailed critical opinion upon its yet unpublished lineaments. The high and richly deserved celebrity of its author renders it an object of so much interest, that we are sure we shall better consult the taste of the public by devoting a few columns to its illustration, than by occupying even half a column by oracular commonplaces upon poetry in general, and the *Siamese Twins* in particular. Our extracts will speak for us, and for the book; and we will only say, that if any one does not feel their force or beauty, the person so unhappily situated will never enjoy the pleasure and delight which its perusal has afforded to us. [N.B. Thursday, past midnight, and our sheet must be at press to-morrow afternoon; so that by printing all night, sufficient Nos. may be ready for our few customers on Saturday morning.*]

Suffice it now to state, that, with much of playful, as well as of deeper satire; little touches of personal plesantry, and more grave, political, and moral allusions; fine poetical passages, imitations which remind us of theRejected Addresses of almost all our principal authors, Scott, Byron, Moore, &c.; and pathos embodied in the language of true feeling, Mr. Balver has produced a volume very unlike what might have been, and such as we actually expected, from its temporary title.

He starts with an inscription to Captain Basil Hall, who seems to have provoked his irony by his recent work on America; still there is no ill-nature in the attack. We are then introduced to the Twins.

"In Bangkok,—all the world must know
Banook's the capital of Siam,—
There lived, not quite an age ago,
A gentleman whose name was Fiam.
Of moderate sense and decent fortune;
He ne'er had need his friends to importune;
He asked them not to clothe or board him,
And therefore all his friends adored him!
For Banook is a place where you,
Frich, have love enough to sate you;
But only ask them for a *sou*,
And, God! how bitterly they hate you!"

So unlike England!!! No wonder the author is tempted into the field of comparison, and not only lauds the superior liberality of this country, but our immense superiority over the Siamese in every other respect. Hodges (the person who brings the Twins over), is a trader and a missionary at Banook, and he is represented as labouring in his vocation.

"But Hodges, though so much he prized
Our power—all foreign rank despised,

Declared, with generous warmth, he thought

The same the sovereign and the snob,
And swore, since Siam must be taught
New steps—to lead off with the mob!

Accordingly our saint one day
Into the market took his way,
Climb'd on an empty tub, that o'er
Their heads he might declaim at ease,
And to the rout began to roar
In wretched Siamese.

'Brethren! (for every one's my fellow,
Though I am white, and you are yellow.)
Brethren! I come from lands afar
To tell you all—what fools you are!
Is slavery, pray, so soft and glib a tie,
That you prefer the chains to liberty?
Is Christian faith a melancholy tree,
That you will only sow idolatry?
Just see to what good laws can bring lands,
And hear an outline of old England's.
Now, say if *here* a Lord should hurt you,
Are you made whole by legal virtue?
For ill by battery, or detection,
Say, can you bring at once your action?
And are the rich not much more sure
To gain a verdict than the poor?
With us *alike* the poor or rich,
Peasant or prince, no matter which—
Justice to all, the law dispenses,
And all it costs—are the expenses!
Here, if an elephant you slay,
Your very lives the forfeit pay;

Now, that's a *quid pro quo*—too serious
Much for beasts *natura fere*.
With us no beast, or bird, is holy—
Such nonsense really seems to shame laws!

And all things wild, we shoot at—*Solely*
Subject to little hints, call'd 'Golem Lawes.'
Your persons down you into giving—
Ours take their own—a paltry living.
Each selfish wish they nobly stifle,
And save our souls—for quite a trifle.
Our lords are neither mean nor arrogant,
Nor was against broad truths by narrow cant;
Ne'er wish for perquisites, nor sinecures;
Nor prop great ill, by proffering thy cures;
Our goods before their own they rate 'em,
And as for younger sons—they hate 'em!
Thus all our patriots are invincible,
And, bless you!—as to change of principle—
'Eva if one wish'd to choose the people,
One's by the Lower House prevented;
There, by a slight expense of tipple,
We've all the Commons represented—
And with such singular ability,
No groat's are spent with inutility.
Thus do we hold both license—and
Despotic fetters in *judicium*;
And thus must England ever stand
Erect—in *triple equilibrium*!

These are the things that best distinguish men—
These make the glorious boast of Englishmen!
More could I tell you, were there leisure,
But I have said enough to please, sure;
Now, then, if you the resolution
Take for a British constitution,
A British King, Church, Commons, Peers—
I'll be your guide! dismiss your fears.
With Hampden's name and memory warm you!
And, d—n you all—but I'll reform you!
As for the dogs that won't be free,
We'll give it them most handsomely;
To church with scourge and halter lead 'em,
And thrash the rascals into freedom."

The Twins are imported by this clever fellow, and their advent in London is good.

"The third day after they had entered
London, of Nash and Cash the boast,
Hodges this paragraph adventured
(As herald) in 'The Morning Post.'

'We hear the famous Mr. Hodges,
Who wrote of Tactoo the description,
Is just arrived in town, and lodges
At present in the hall Egyptian.
With him two wondrous creatures he
Has brought, we understand, from Siam,
Which all the world will flock to see,
And much the sight will edify 'em.
Two boys that have together grown,
Across the breast joined by a bone;

Of the faculty, invited gratis,

Each gentleman we beg to state is:
Already Messrs. Cooper, Brodie, Gee,
Lawrence, and Vance, have seen the prodigy—
Declared it can be no deceit,
And sworn the sight was quite a treat.
This—notice towards them to divert is meant,
See for particulars advertisement.
N.B. In such a way they're joined,
As not to shock the most refined."

"The public then were disengaged—
No Lyon in especial rage!
For poetry there was no passion,
All politics were out of fashion;
The last new novel, called 'The Peetrage,'
Had fallen flat upon this queer age."

"No kings were going to Guildhall,
No dukes were 'trembling to their fall';
Both Charles and Charleys lived in peace,
No Philip there—here no police.
Savemy thieves walked the nightly pugs,
And placeless walked the pensive Whigs,
Time frowned not—and the distant storm
Slept dull on that dark sea—Reform.
—In such a dearth of conversation,
Judge if our Twins caused some sensation.
From ten to five o'clock each day,
There thronged to see them such a bevy,
Such cabs and chariots blocked the way,
The crowd was like a new king's levée.
Sir Astley bid high to secure them,
To cut up when the spring was o'er;
He had, he begged leave to assure them,
Cut up 'The Skeleton' before.
'Twas much, they'd see, if they reflected,
To be with care and skill dissected;
And if next year they would prefer—
Was not at present in a hurry."

"Old Crock much wanting then some new
Good speculation, tried to steal them;
While Lady — the famous Blue,
Gravely requested leave to feel them.*
Pettigrew said he'd keep a nice
Glass case on Saturdays exposed for them,
And Mrs. M * * *, who'd married thrice,
With great civility proposed for them.
But, thanks to Hodges, all these perils
They 'scaped unhurt—for thus the state
Of man is ever: when we fear ill,
Heaven saves us from the menaced fate;
Except the few not worth a better,
A handful, of hang'd, drow'd, burnt, et cetera."

"Meanwhile with every day increases
The fashion of the brother pair;
Fashion, that haughty queen that fleeces
Her lovers with so high an air.
I think on earth that Jove did drop her,
A *Danese* from the Olympian opera;
Sent first to glitter and to gladden us;
Next to attract, allure, and madden us;
Thirdly, to ruin each beginner
In life, content with that—to win her!
But when he's bought the jade's carresses,
He finds the charm was—in the dress!
While Jove, on high, beholds, methinks,
The new-baited sutor's melancholy,
Applauds the cunning of the mink,
And chuckles at the green-horn's folly."

We are charmed with this fully philosophical *exposé of fashion*, and shall add to it a trifle more on Almack's, to which Lady Jersey invites the Siamese.

"And Jersey, after whose own heart is
The grave, asked Chang to all her parties—
But only begg'd he would not bring
His vulgar brother, Mr. Ching!
She sent him once a card for Willis's,
That pretty pastoral spot, where Phillis

"* Conversing once with a Blue of some celebrity, I had the mortification of perceiving that she was all the while peculiarly restless and fidgety. At length she said, with considerable *nécessité*, 'Excuse me, I must go and feel that gentleman.' Accordingly with great gravity she walked up to a handsome foreigner, and, avowing herself a disciple of Spurzheim, requested leave to feel his head. I remember that the handsome foreigner was not a little disconcerted, for he was a great beau, and he wore a wig."

* This part is a hint to late correspondents and others. We have a large impression to print, in a different form, of some principles from a newspaper, besides the foregoing, &c., which literary character demands, to be ready for the early supply of Saturday night.

And Damons dance extremely badly—
Where married dames coquet it sadly—
Where, this the law supreme and vital,
No sin comes here without a title.
Where, if a few slight faults or frailties—
Unwringing maids and liberal wives,
Breaking dull wedlock's cold and stale ties,
The pure religion shrives—
At least the low commercial route
'The ladies' piously shut out;
And fierce to trade as any Goth's child,
Preserve the moral air from Rothschild.

"We've said in some one of our pages,
That Chang had lately conned our sages.
But most of all the books commanding
His thoughts, was Locke on Understanding;
That great name spoke hard by—he heard—
He turned—enraptured at the word,
And L—k (the handsome captain) took
For the young author of the book;
Accordingly he strait address him,
With compliments in thousands prest him—
Swore that no man he so admired,
And humbly where he lived inquired.
Quoth he, 'The human mind is found,
Having in all climes the same faults.'
He ceased—the captain looking round,
Saw him whirl'd off into a waltz.
For Ching, who lik'd those giddy dances,
Was now engaged to Lady Frances—
Sweet lady, daughter to Lord Connor,
And fairest of the maids of honour.
Meanwhile the smiling lady mother
Steps up, and whispers in her ear,
'I hope it is the elder brother,
And not 'the detrimental,' dear."

From the poor world of artifice let us turn
to the world of beauty, real or ideal; and we
cannot find it sooner than by reverting to Mr.
Bulwer's description of the Twins leaving
their home, where a great dread of sea voyages
prevails.

"Alas! In vain in every shore,
For something never won, we yearn!
Why needs this waste of toil before
Life's last yet simplest truth we learn?
Oh! that our early years would own
The moral of our burial-stone—
The true to kalon of the breast—
The *dear* of the earth is—*Rest*!

As birds that seek, athwart the main,
Strange lands where happier seasons reign,
Where to soft airs the rich leaf danceth,
And laughs the gay beam where it glanceth—
Glancing o'er fruits whose purpling sheen
May court the rifling horde unseen;
For there earth, air, and sun conspire
To curb, by sating, man's desire—
And man, half careless to destroy,
May grant ev'n weakness to enjoy.
So hope allures the human heart,
So shows the land and spreads the chart;
So wings the wishes of the soul,
And colours, while we seek, the goal!

The shore (as on the wanderers fly)
They left, hath melted into sky.
The shore they seek—alas! the star
That guides on high seems scarce so far.
With weary wing, but yearning breast,
Unlike the dove, they find no rest.
The broad sea with its aching sound,
The desert heaven, have girt them round.
On, on!—and still the promised shore
Seems far, and faithless as before;
And some desponding droop behind,
And some are scattered by the wind,
And some perchance who best might guide—
Sink, whelmed the first, beneath the tide.

Thus on, the hearts that Hope decoys,
Fly o'er life's waste to fancied joys,
The goal unseen, the home forsaken,
Dismayed, but slow, from dreams we waken.
The friends with whom we left the shore,
Most loved, most missed, are seen no more;
And some that sink, and some departed,
But leave the lingers weary-hearted.

On, onward still, how few remain
Faint, flagging, of that buoyant train,
With glittering hue, and daring wing,
And bosom that must burst or sing.
On, on! a distant sail appears—
It comes—exhaustion conquers fears,
And on the deck, a willing thrall,
The wearied, hopeless, victims fall:
And ev'n amid their drearest foes
Feel less of peril than repose!
And thus, oh, thus, no more deceived,
Worn out, tamed, baffled, and bereaved,
Even all our youth's life loved self-banished;
The glory from the dull wing vanished;
Bowed by the distance and the gale,
The hardest faint, the boldest fail.
Whate'er the spot that proffers rest,
We drop, the victim or the guest;

And after all our wanderings past,
Feel death has something sweet at last."

Is not the following also enchanting poetry?

"How holy woman's youth—while yet
Its rose with life's first dew is wet—
While hope most pure is least confest,
And all the virgin in the breast!
O'er her white brow, wherein the blue
Transparent vein seemed proud to bear
The warm thoughts of her heart—unto
The soul so nobly palaced there—
O'er her white brow were richly braided
The tresses in a golden flow;
But darkly slept the lash that shaded
Her deep eye, on its lids of snow.
What could that magic eye inspire?
Its very light was a desire:
And each blue wandering of its beam,
Called forth a worship and a dream;
The soft rose on her soft cheek;
Had yet the sun's last smile to win;
But not the less each blush could speak
How full the sweetness hived within.
The rich lip in its bright repose
Refused above its wealth to close."

"O Woman! day-star of our doom—
Thy dawn our birth—thy close our tomb,
Or if the mother or the bride,
Our fondest friend and surest guide;
And yet our folly and our fever,
The dream—the meteor—the deceiver—
Still, spite of sorrow—wisdom—years—
And those—Fate's sternest warners—tears—
Still clings my yearning heart unto thee,
Still knows no wish like those which woo thee,
Still in some living form essays
To clasp the bright cloud it portrays—
And still as one who waits beside,
But may not ford, the faithless tide—
It wears its own brief life away—
It marks the shining waters stray—
Courts every change that glads the river—
And finds that change it pines for—never!"

The rage of London for *notoriety* is cleverly
painted in the reception of Chang and Ching.

"First came the learned Misses Berry,
Whose talk I hear is worth the listening;
And next the sparkling Londonderry
Called to invite them to a christening.
The fashion set, the vassals follow;
All ask, press, pray, for Chang and Ching;
They beat three Polish princes hollow,
And half outshine a Carib king.
Sole instance here, this my muse hints, is
Of folks much sought for, though not princes;
For *here* we're so divinely loyal,
Nothing goes down that sounds not royal.
Some foetid king from Hottenot
Would be all day at the balconies;
While, when in town, Sir Walter Scott
May dine in quiet with his cronies.
Prince Raggedbush comes o'er—all fall on him!
Were Gothe here, pray, who would call on him?
Of Ching—that diamond of good fellows,
Tom Moore, begins to grow quite jealous;
For Ching once made a happy hit,
And complimented Lady Frighful,
And so became the reigning wit.
Whom all such ladies called delightful.
Besides, on the piano-forte
Siamese ballads he could sing;
And, oh! they were so sweet, so naughty,
You'd scarce have known Tom Moore from
Ching.

And really Chang, who, sulking by,
Sat with curled lip and drooping eye,
While, Moore-like, Ching performed the siren,
Made no bad sort of Banook Byron.
As they professed opinions liberal,
And Chang was thought a youth of *mode*,
They went where wordy wits glibber all
Ineptitudes—at Holland House.
There, Allen, all about the riches
Of Slane, with its manners, laws,
Pump'd out, to pour into those speeches
Which gain his lordship such applause.
Those speeches when the frost of years
Melts, as Monseigneur swirls from Madame,
And gushes out upon the Peers,
The History of the World since Adam!
The Duke of Devonshire was very
Civil—he's really a good fellow!
And D—, when he saw, grew merry,
Two faces than his own more yellow.
Lord Granville courteously desired
They'd join his coterie of whistlers;
And Esterhazy much inquired
If they were sure they had no sisters!"

The touches of well-known character in this
quotation need no pointing out for metropolitan
circles; and of some of them it is as well that
our country and foreign readers should remain
ignorant. We quit them willingly, to select a

few of the many striking, though brief, beau-
ties which are thickly scattered through these
pages.

Just remark.

"I own I think that the sagacious
Are very seldom found loquacious;
Balbutius may at times blush us;
But—oh! the mute bite of a Cassius!"

A portrait.

"Fix'd on the wan Earth's mystic breast
His eyes—intent but dreaming—rest;
His mute form bending musingly,
And his hands clasp'd upon his knee.
Calmness sat round him like a robe."

Encore, a hit.

"Among the thousand virtues which
Are only found in my possession,
I think I'm singularly rich
In that—the best of all discretion.
Not less in letters than in action,
I know the golden mean to keep,
What scene to dwell on, or what fact shun,
And where to gallop or to creep.
This truth I blush not to repeat,
'Tis policy to have conceit."

Curious example.

"Chang found for reading ample leisure;
Indeed, the day's a sort of beast,
Of which the body is the least;
The head, and tail, let study seize—
And with the rest, do what you please!"

A man, whose father, after a dissipated ca-
reer, had

"Retired from life on prussic acid,"

is mentioned with

"Two maiden aunts, who thought him pretty,
Bestowed upon him more than pity;
Sent him to school, and thence to college,
And *wing'd* ability with knowledge.
Large was his mind, and clear—yet deep;
A little pensive, but not whining;
Ambition, courage, hope, can keep
All stuff, worth keeping, from repining."

Simile of a wish.

"As if—but the reflection's stale—
We ever could, with all our trying
To throw the salt upon its tail,
Prevent that bird—a wish—from dying."

A sort of heart, by no means uncommon in
the world:

"When once a man's mind is resolved,
'Tis useless to his heart appealing.
You can't get through the leaves involved
Around his artichoke of feeling."

It is difficult to separate these little morsels,
however neat or pithy, from the matrix in
which they are imbedded, and we shall only
add one other of them.

"Alas! how in the world we're made for,
Sins conquered, really are sins paid for!
We break a head, inspired by wine,
What plasters up the wound?—a fine;
We steal a wife—we foul a name—
What mends the matter?—still the same?
In justice her sentence law dispenses,
And notice only means expense."

We must now hasten to a conclusion: in a
part of his poem Mr. Bulwer alludes to Burns,
and we transcribe the following observations,
with a keen sense of their justice:—

"All mankind, to whom, even mediately,
and through unseem channels, the glorious verse
of Robert Burns can reach, have incurred a
debt of gratitude, and that no slight one, to
Mr. Lockhart, who has honoured literature (in
his biography of that illustrious poet) with a
work full of just, and manly, and noble senti-
ment. It is difficult, indeed, to command one's
indignation, when one hears fine gentlemen
critics, who sin delicately, and grow elevate on
Chamberlin—and to whom we owe no earthly
gratitude, and no earthly indulgence—talk,
between snuff-takings, of the immoralities of
Burns. Every country squire, and city clerk,
and puny dandyling, may enjoy in quiet his
loves and his intoxications; they are but the
proofs of his spirit, or obediences to the man-
ners of his time. But if Burns, the benefactor
of the world (for whom reverence should in-

duce indulgence), does what they do who are its enemies;—then come pages of sermons, and mawkish lecturings, and judgments righteously severe. Every sword of the Pharisees leaps out of its scabbard. One would think, to hear them, that it is a great pity a man of genius should not be born without flesh and blood."

The above is a note appended to the annexed passage:

"Oh! wise—wise fools, whose tender art
So coldly probed each fault that dyed
With its own blood that generous heart;—
Who, in your grateful thought, denied
To him whose memory yet exalts
Man's soul—say, in those very faults—
To him, who like an air from heaven,
Breath'd life and glory on your way;
The mercy and the silence given,
Of right, unto the humblest clay.
In life's cool walk, if one hath blest
A single, just, or grateful breast;
Yet hath, in error, stung or saddened
The breast his 'customed bounty gladdened,
Say—were it thine—wouldst thou resent?
Would love or anger find a vent?
Say—would it not thy heart relieve
To have one memory to forgive?
But he, who serves all earth,—whose mind
Stares the dark wanderings of mankind;
And from lone thought's empyrean height,
Exalts the soul, its glories light,
For him, no grateful memory lives,
No justice weighs, no love forgives;
For him, the universal eye,
Each heart he cheered, hath grown his spy.
The very lustre of his fame,
Betrays the specks upon his name;
The columns of his triumph stand,
As Pasquins for each vulgar hand.
For him the wonted shades which hide
Home's reverent secrets, are denied;
Exposed, dissected, canvass'd o'er,
Each household wound and hidden sore;
His very heart hung forth a prey
To the sharp-tongued 'remorseless day.'
The temple he hath built will yield
For him alone no shrine to shield;
Nay, round the altar where he fleeth,
The cold'd and venom'd slander lieth—
Crush'd by the serpents of his doom,
Behold his temple walls his tomb!"

We regret to close; but we shall resume the subject next Saturday, by which time we trust the *Siamese Twins* will be before the public—and never to be divided—from its applause.

TEMPERANCE SOCIETIES.

A Letter on the Effects of Wine and Spirits.
By a Physician.

Political Evils of Intemperance; or, a few Observations and Statements pointing out Intemperance or Drunkenness to be as disadvantageous to a Nation as it is ruinous to an Individual. By J. H.

Address to the Temperate. By the Rev. John Edgar, Professor of Divinity in the Belfast Institution.

Temperance. (Extracted from the *Belfast News-Letter* of the 6th Oct., 1829.) By the Same.

We are never intemperate at any time, more especially when Temperance Societies are the objects of our attention. Anxious to slake our thirst for information on this subject, we have imbibed all within our reach: we have suffered ourselves to be voluntarily afflicted with five violent "attacks," and all the "evils, political and nosological, of intemperance." Tracts innumerable, and "addresses" unutterable, have we endured, and cannot but acknowledge that we have seldom met with so dry a subject. The thunder of these Societies is enough to turn sour all the wine in the country; and as such, doubtless it will be renounced. "Red spirits and white, blue spirits and gray," will no longer "mingle" with water, lemon, or sugar—"blue ruin" will henceforth be nought but a *salus populi*, and the blue devils will sob and sigh in the undisturbed broodings of melancholic philanthropy. Wine was wont "to

gladden man's heart," but now it only turns acid on his stomach. Our sailors once drank grog, and swept the seas; now, rum is poison, and tobacco an abomination in the smell of the saints; and Jack is taught, instead of a "quid," to chew the end of a long-winded tract. It cannot escape the eye of speculation, that if the efforts of these numberless humane Societies were all simultaneously crowned with success, nothing human would be left on the face of the earth—all the characteristics of humanity would sleep with our fathers—our five unfortunate senses would be nullified—or, in plain phrase, the whole world would be a mass of nonsense. With this as the foundation for their plans, and the object of their endeavours, with human error for a text, and the gulls of humanity for a congregation (a crowded one)—societies spring up, froth for a time, bubble, and burst. Somewhat after this leaven, a hue and cry is now being raised against all "the stirring spirits of the age," from gin to curaçoa; and we have ourselves somewhere read, that beer ought to be looked upon as a most ungodly liquor, because it will sometimes *work* upon a Sunday. We forego becoming members of these Temperance Societies, from our unwillingness to increase the chagrin of those who have already received our refusal of such distinctions. We have been solicited to take an active part in an Anti-damn Club, whose primary object was to undermine the prosperity of swearing, by enforcing all the un repealed fines to which these popular ebullitions are still liable; but, with the fear of "d . . . n" before our eyes, we feel inclined, with Bob Acres, to trust that "damns have had their day." We have been urged to put up for the dignity of President to an Anti-pun Club: this, also, we declined, as being no joke. We feared, too, lest a flash of our own, by dissipating the conventional dullness of the society, might hazard the authority of the chair, set the learned body at loggerheads, and occupy that time in personal squabbles and petty animosities, which honourable members professed to dedicate to the furtherance of very different objects.

In reverting to temperance from intemperate societies, to which we have momentarily digressed, we cannot but confess ourselves profoundly puzzled by the arguments of its advocates. One observes—"Temperate men give their countenance and support to such occasional exhilaration of the spirits, by intoxicating liquors, as produces levity, and foolish jesting, and unnatural excitement, though all such exhilaration is intemperance. Temperate men countenance and practise a resort to intoxicating liquors, as a means of invigorating the intellect or producing pleasant sensation, though all such resort is intemperance. Temperate men countenance and practise the *prudent use* of ardent spirits, though such use is *necessarily* the first step in drunkenness, and, in multitudes of instances, the parent of disease, and crime, and misery."

We would ask this warm and worthy man, in his more sober moments, whether the virulent deceration of temperate men is altogether calculated to aid the cause of temperance?—whether vituperating "the prudent use of spirits" is the wisest way of commencing a campaign against their abuse? This gentleman, however, will have it, that moderation is excess; and so we leave him to pursue his crusade against what custom and the climate have induced some evil-disposed persons well nigh to class among the necessities of life. Others bring to the charge the *nova cohors febrium*, and "all the many ills that *tush* is heir to."

Aristocratical gout, and republican punch-blossoms, "epilepsy or the falling sickness," *quarry* "falling sick"—not to mention *cat-alepsy*—are the most trivial consequences enumerated. This is a more sensible attack upon the weak points of vice; and provided the friends of temperance advocate their cause temperately, confining themselves to such topics as will not challenge the contradiction of experience, we dare say people for the future will relinquish the juice of the grape, and content themselves with that of the pump. In the meantime, should such exceptions to their general rules occur, we recommend all members of these societies to imitate the beadle of the Adelphi, and fine themselves five shillings for getting drunk; thereby setting a good example, and considerably augmenting their funds.

Upon this subject, though we do not think the institution of Temperance Societies (i. e. associations by belonging to which persons refuse to drink wine, spirits, or malt, and stick to pure Adam's ale)—though we do not think such Societies have yet made much progress in Britain, it may not be foreign to our illustration to quote what is said in a foreign journal respecting them in America.

"The Temperance Societies continue to excite a lively interest in the United States. Above 100,000 persons have pledged themselves to an entire abstinence from spirituous liquors. Young people are especially earnest in this good cause. Corporations, agricultural bodies, farmers, heads of establishments, and thousands of respectable individuals, refuse to furnish those liquors to their labourers and workmen. Students, lawyers, ecclesiastics, legislators, magistrates, have inscribed their names among the promoters of this reform. But four years ago, the extent of the evil was so great, that a remedy for it was considered to be hopeless. Now a confident expectation is cherished that it will be eradicated. From the North to the South, from the East to the West, there is but one feeling on the subject. 'We have discovered,' said a citizen of North Carolina, 'the club of Hercules, with which, by the blessing of God, to vanquish the hydra of intemperance.' The fundamental principle of the reform, that which is acknowledged to be the only efficacious one, is an *entire* abstinence from spirituous liquors. Numerous instances prove that the determination to use them moderately produces no durable effect;—they must be completely relinquished. A great many distilleries are no longer at work, in consequence either of the principles of their owners, or of necessity; for the diminution of the sale of spirituous liquors is felt, in almost all the states of the Union, in the proportion of from a fourth to nine-tenths; and in some places, even to its extinction. A merchant in one of the principal towns lately wrote to his correspondent, that the sale of liquors of all kinds had fallen three-fourths. The agents of a French house, which for several years had sent 5,000 pipes of brandy annually into the country, on recently applying to those whom it had been accustomed to supply, could not find a single purchaser. The public opinion which stamps the selling of spirituous liquors with a moral brand, is every day becoming more powerful. A committee of one of the societies declares that it knows 400 persons who have, from conscientious motives, discontinued to vend distilled liquors. Above forty vessels had sailed within a short period, without taking any on board for their crews. A great many militia regiments had resolved to disuse them. Before the establishment of these

Temperance Societies, the annual consumption of spirituous liquors in America amounted to from fifty-six to sixty millions; or from four to five gallons to every individual, man, woman, and child. This was an annual loss to the consumers, of a hundred millions of dollars. Pauperism and crimes were quadrupled by drunkenness. A fourth of all the insanity, and a third of all the disease in the country, were the results of intemperance. From the same cause, above 30,000 persons descended every year into a premature grave. Of the 5,000 crimes annually brought before the courts of justice at New York, three-fourths proceeded from intemperance; and of the 30,000 persons who were summoned as witnesses, half were under the influence of strong liquors when the crimes respecting which they gave their evidence were committed. All these details, and a thousand others of the same kind, prove the incalculable benefit which these Temperance Societies are producing. The most vigorous measures are adopted in aid of them. Associations of the people, of all ranks, are formed for that great object; and it is even said, that in one of the towns of the United States, a great number of girls have entered into an engagement not to accept as a husband any person who does not completely abstain from spirituous liquors. We detest cant, and its language; but it is impossible not to admire the grand moral spectacle afforded by this determination of a whole people to purify themselves from what has long been their distinguishing national vice."

This is very well for America. In England, perhaps, where people don't drink too much, an anti-over-eating, or anti-gluttony, or anti-eating society might prosper, and be particularly efficacious about Christmas.

Journal of a Nobleman; comprising an Account of his Travels, and a Narrative of his Residence at Vienna during the Congress. 2 vols. 12mo. London, 1831. Colburn and Bentley.

OUR author, one of the French noblesse, as it seems, and distantly related to the old Prince de Ligne, has a considerable resemblance to one Gratiano in the *Merchant of Venice*, who is accused of saying an infinite deal of nothing, and whose reasons are compared to a few grains of wheat in a bushel of chaff. This being the case, we can hardly think it worth while to have got up and published these two volumes; the best matter of which might do tolerably well for the slip-slop of a *Court Journal* or a *Lady's Magazine*; but which is, at the same time, desperately trifling and tedious in the shape of a book to be read continuously. The first volume contains the "Nobleman's" travels from Moscow, through parts of Poland, Turkey, Wallachia, Transylvania, and Hungary, to Vienna, where he arrives in time to take a share in the amusements of that capital during the celebrated Congress. His account of the Winski's, and Rinski's, and Dolderoff's, and Pushkin's, whom he happened to see on his route, or to meet at balls and festivals—few of them possessing the slightest interest for the English reader—forms the mass of his book; episodes relating to past events, such as the siege of Copenhagen, help to make out the rest; and a few anecdotes, which, we believe, have already done their duty in the periodical press, complete the *risfacciamento*. Now this is book-making, and shews that your "Nobleman" of the present day is exactly like your "Person of Quality" of some fifty or seventy years ago.

Yet, however much we dislike the system of title-pages and lists of contents devised most skilfully *ad captandum*, and leading most certainly to disappointment, we shall do our fair duty to the writer, by picking out a few specimens of his work, which may perhaps entertain our friends. Without questioning the veracity of a Nobleman, we give a remarkable description of the dexterity of the Ukranian peasants with the axe:—it will be seen the style is not very English.

"Not only they employ it in the construction of their houses, their boats, their carriages, and their household furniture, but also in carving a variety of small things, such as little boxes, spoons, and other kitchen utensils. I purchased a very handsome snuff-box from one of them, which had been cut with a hatchet commonly used for felling timber. In the province of Masovia they are still better exercised in the art of rendering the axe universally available. I have been assured by several persons whose testimony I could not doubt, that they have themselves seen peasants, who wore their hair long, go and place themselves against the trunks of trees, raising their hair as much above their heads as it would reach, while others would take aim at a certain distance, and fling their hatchets with so much dexterity as to cut the hair in two parts, and be driven deep into the trunk of the tree! Similar feats beat William Tell's hollow. They are not, however, the only kind by which dexterity was practised in Poland at the risk of a tragic end. In former times it was customary in the *châteaux* of the nobility, after banquets given on great occasions, for the host to shew his guests his skill in firing a pistol, by making the heel of the shoe on his wife's foot his target! I could hardly convince myself that the higher classes among the Poles, who have always considered devotedness to the fair sex the glory of ours, should have suffered a practice so directly at variance with every feeling of common humanity, to prevail among them—those men, whose notions of gallantry in the present day are apt to carry them to so extravagant enthusiasm, that I have seen them at table take the shoe off the foot of the mistress of the house, drink wine out of it, and pass it round!"

In Transylvania the peasantry are, we learn, as clever with sticks, for they often go out hunting with them; and by throwing at hares, knock down twenty in a day's sport! But we must change from the travels to the Congress. The present state of Poland gives some interest to the following: the remarks are put into the mouth of a M. Novosilsoff, a Russian statesman in repute with the Emperor Alexander.

"The Poles (he is reported to have said) are ever carrying back their thoughts to the brilliant times of their history, and they want their country to re-assume that proud attitude of independence it enjoyed under the Batoris, the Sigismonds, the Sobieskis, without one moment thinking of the immense changes the political condition of Europe has since then undergone, and their peculiar geographical position, which makes it impossible that they should stand again on the same footing as formerly. Poland is now linked to us, and must be content with the fate which is unavoidably reserved for her political existence. If ever we allowed her to become completely independent, she would make an Asiatic nation of us, and we are not disposed to recede. 'Burke has said,' observed the prince (de Ligne), 'that the partition of Poland would be paid dearly for by its authors: he might

have added, that such might be the case with her defenders also; for Napoleon's interference with her concerns has in no small degree contributed to the loss of his crown. I hope a better fate will be reserved for the Emperor Alexander; but all must depend upon the adoption of suitable measures, and their security on a firm basis. A people who are proud of themselves may suffer themselves to be conquered, but will not bear to be humiliated. The force of arms may achieve their conquest; but it is only through a generous and just policy that they may be thoroughly subjugated.' 'You need not apprehend any system of policy, my dear prince, of which the Poles will ever have reason to complain at our hands. If you read this manuscript, the margin of which is full of notes, written in the Emperor Alexander's own hand, you will find how great is our desire to meet the wishes of the Polish nation. This is the constitution intended for them. It will enable you to judge whether the lofty sentiments which spring from the heart should not be taken as the guarantee of that monarch's good intention. The institutions of that country, hereby fixed upon a solid foundation, will become the means by which the peace of Europe may be ever maintained.' 'If the bases of the edifice are proportioned to its weight, and of comparative solidity, they will, no doubt, prove durable; but if not, you may have to fear the vengeance of men who are driven to desperate means.'"

The Prince de Ligne, who at this period was, as appears from his relative's account, a superannuated gallant, draws a glowing picture of the Poles, as he saw them in 1788. "Who (he says) would not feel an affection for Poland, the Poles, and above all, the Polish women? Who would not admire the wit and courage of the men, and the grace and beauty of the women? The manners of the Polish ladies are more exquisitely fascinating than those of all others. To prefer another city to Warsaw is impossible. There you find the most refined *ton* of Paris allied with oriental manners, the good taste of Europe, and the magnificence of Asia united, the politeness of the most civilised society, with the plain, unaffected hospitality of barbarous nations. Who would not admire a people whose external appearance is universally noble and prepossessing; and whose manners, though plain and unassuming, are polite and cordial? In the cities you meet with good breeding and urbanity every where, and in the country a good-natured roughness prevails. The comprehension of the Poles is quick, their conversation light and agreeable, and their education has made them possessors of every talent. They have the gift of languages, are deeply read in general literature, eloquent, and accomplished. Their taste in every thing is highly cultivated; they are admirers of the fine arts, passionately fond of fêtes and private theatricals, and of their national dancing. Their dress is original; some of their customs extraordinary; their style of living magnificent. They are good and open-hearted, and very gratefully inclined. My own admiration of them is unlimited." Indeed, the acknowledged character of the Polish ladies seems to have been of the very right sort for the gay, flattered, and flattering Frenchman, of whom we are told the following anecdote in 1814, when he was only eighty years old! The writer had been dining out, and left his party late; and he tells us—

"The night being very fine, I returned home by the ramparts. I was far from expecting to meet any one I knew; for, in spite of the

various amusements of Vienna, and the numerous foreigners who thronged to them, all in general retired to their homes before midnight. In one of the bastions which projected over the moat, I perceived at a little distance a tall figure wrapped in a light-coloured cloak, which in the moonlight looked very much like the ghost in Hamlet. Curiosity induced me to approach; and it was not without surprise that I recognised the Prince de Ligne. 'Ah, prince!' I exclaimed, 'what are you doing here at this late hour, and on so cold a night?' 'In love,' replied he, 'all the charm is in the beginning; and therefore I like to renew that beginning as often as possible: but at your age I was waited for: at mine I am obliged to wait; and what is worse, I wait to no purpose.' 'I presume, prince, you are here on an assignation?' 'Yes; but unfortunately you see I am alone.' 'Ah, prince! if it be true that a woman can enjoy no happiness except by the reflection of another's glory, where is the woman who would not be proud to owe her happiness and glory to you?'

'Non, non! tout fuit dans le vieil âge;
Tout fuit jusqu'à l'illusion.
Ah! la nature aurait été plus sage
De la garder pour l'arrière saison.'

'Prince,' said I, 'I will not intrude upon you any longer.' 'And I,' replied he, 'will not wait any longer. Lend me your arm, and let us go homewards.' As we walked along, the prince's conversation bore a tinge of melancholy, which was evidently the result of the little disappointment he had just sustained. 'One might be tempted to believe,' said he, 'that in life reflection comes only as a last misfortune. When old, we live by the heart and the imagination: when the body begins to decay, it is only love that can warm us we still live.' 'Yes, prince; but the advantage of experience and reason must not be forgotten.' 'True, reason helps us to tolerate and console, and that is to love.' He then reverted to some of the brilliant incidents of his long career; detailing several of his feats of arms, without forgetting the moments he had devoted to love. 'But,' added he, as he finished the picture, 'life is like a cup of clear water, which is disturbed as we drink it; the first drops are ambrosia; but the sediment is at the bottom. After all, what does it signify? Man arrives at the tomb as the wanderer reaches the threshold of his home: and here I am at mine. Good night!' I then left that excellent and extraordinary man, whose only foible, perhaps, was that of not accommodating his taste to his age, and giving credit to the fable of the Loves crowning the gray hairs of Anacreon with roses."

We confess we could hardly stand this; but as it occurred within about a hundred pages of the end of the book, we gulped down our little feeling of hysteric, and got through our critical labour, the remaining results of which shall be comprehended in three brief sentences.

Anecdote of the King of Denmark.—"Lustig, which means a merry fellow, is the name given in the German regiments to the soldier who amuses his comrades by his gaiety and humour. This title was very appropriately given to the King of Denmark at the congress of Vienna. Political considerations had prejudiced against him most of the sovereigns in the early part of the congress; but his agreeable manners, his ready wit, and unaffected humour, soon gained for him the best wishes of his brother monarchs. When about to quit Vienna, the Emperor Alexander, who had conceived an affectionate regard for him, in taking leave

said to him, 'Sire, you carry all hearts away with you.' The king unhesitatingly replied, with a good-natured smile, 'Hearts, perhaps, sire; but not a single soul.' This witty allusion to the unprofitable part he had taken in the proceedings of the congress can hardly undergo translation without losing its force."

Bon-mot of Talleyrand.—"The reigning Prince of Reuss, during the time of the French republic, commenced an official despatch with the words, 'The Prince of Reuss acknowledges the French republic.' M. de Talleyrand, whose business it was, as minister of foreign affairs, to reply to the note, wrote at the head of his, 'The French republic is happy to make acquaintance with the Prince of Reuss.'"

We had intended for our third extract a notice of Isabeau the painter having jumped, by mistake, on Buonaparte's neck, and throwing him down while playing at leap-frog, at which the first consul was mortal angry: but it is too long for its worth; and we have only to take off our hat, and bow to the "Nobleman" who has preserved the story.

A View of the Legal Institutions, Honorary Hereditary Offices, and Feudal Baronies, established in Ireland during the Reign of Henry the Second; deduced from Court Rolls and other Original Records. By William Lynch, Esq., F.S.A. &c. &c. Longman and Co.

This title exhibits a goodly bill of fare, from the contents of which we promised ourselves a repast of no ordinary description; and from the typographical execution of the work, as well as the names of the publishers, we were not disposed to lessen our expectations.

We sat down, therefore, with a determination to see out the entertainment, *ab ovo usque ad mala*, and of course, began with the dedication "to his Grace Arthur Duke of Wellington" (with 15 other titles), whom, however, our author rather uncourtously tells, "that authentic information scarcely needs the patronage of great names;" yet when he reflects "that his Grace is descended from those ancient dignitaries, the hereditary standard-bearers of Ireland, he considers that the following attempt might gain additional interest by being inscribed to his Grace."

We are not disposed to be captious, but the perusal of this dedication induced certain misgivings as to what might be the future complexion of the work; and we turned at once to the preface. Here the author very naturally mentions the assistance he has had in his labours, and the sources whence he has drawn his information.

To several noble and exalted individuals he takes leave to express his thanks for their polite attention to his inquiries.

But it is to the Honourable William Butler that his expressions of gratitude are most unbounded; indeed, he does not scruple to state, that it is to this gentleman's knowledge of British and foreign dignities, as well as (of) disinterested friendship, that we are indebted for the essay on the Butlerage of Ireland. How far such knowledge might be useful in establishing the antiquity of, or producing an essay on the dignity in question, some might doubt; but an extract from the essay will speak for itself. "In Ireland, as is stated in the early records, the office or dignity of hereditary Chief Butler, has been enjoyed by the ancestors of the Earl of Ormonde from time immemorial, and was conferred upon Theobald Walter, soon after 1170, by Henry the Second!"

On examining the work itself, we meet with an assertion respecting certain dignities, which "survived the abolition of the feudal system, as parliamentary peerages; namely, the baronies of Arklow, Athenry, Barrymore, Clanrickarde, Delvin, Dunboyne, Dunsany, Fermoy, Gormanstown, Howth, Killeen, or Rathregan, Kinsale, Loxnan, or Kerry, Ophaley, Slane, &c.; that they have from time to time been inherited, and are now enjoyed in direct opposition to the English law of dignities on which such claims are founded." Knowing something, as we do, of the titles mentioned, we do not hesitate to affirm (with all due deference to the author), that whilst some of these have never been held by persons who were peers at any time, others have actually descended by the very same rules as English peerages. Arklow, for instance, was resumed by the Act of Absentees, in the reign of Henry VIII. as part of the estate of the heir general of the Earl of Ormonde.

Athenry and Delvin have both been declared, by the law officers in Ireland, to be baronies *in fee and in abeyance*; and the present barony of Ophaley is a title created by patent to heirs male by Philip and Mary.

We are, therefore, at a loss to understand our author, and have come to the conclusion, that he cannot mean what he says, or know what he means; and it certainly does appear strange, that with respect to one of those mentioned (*Clanrickarde*), he should make an assertion which is directly in contradiction to a document cited by himself in page 340; where, after the bishops and peers in due order named, there appear a few other names, amongst whom is "William de Burgo, chief of his nation," with this announcement to all their names, "*Isi nondum sunt de p[ar]liamento.*" If these words denote the dignity of peerage, it must be by some interpretation which does not transpire from the ordinary translation: we wish the author himself would interpret.

There is another assertion, page 103, to which we must advert. Talking of the office of standard-bearer, the inquiry concerning the origin of which derives such interest from being inscribed to the Duke of Wellington, as a descendant from that ancient dignitary!, the author asserts—"that it descended to the present standard-bearer, the most noble Richard Wellesley, Marquess, &c., who at the coronation of George the Fourth was allowed his rights and precedence as hereditary standard-bearer of Ireland." Now we assert, and we assert it on authority, that the marquess did not claim these rights, was not allowed them, and did not hold precedence as hereditary standard-bearer of Ireland on that occasion.

We have also a new historical fact related at page 334—namely, that Henry the Fifth had a son Thomas, who was in Ireland between 1414 and 1419. We should be sorry to throw discredit on "the ancient registry of Armagh," in which it is said to be stated—but we cannot help expressing surprise at not having met the mention of such a person in any other authority whatsoever: we had been under the impression, however erroneous, that his majesty was not then even married.

It is not now our intention to undertake the task of selecting the valuable documents recorded in the work; but we cannot help expressing our disappointment (to say no worse) at the attempt of "our author" thus to give a new colour to those valuable documents, and to draw conclusions which are not borne out by the documents themselves, nor are in accordance with the history of the country: for

instance, amongst others, page 21—"All cases which could not be decided, on account of their difficulty, before those justices in the county courts, are referred by the *Magna Charta of England to the Court of King's Bench*; but no such power of reference is provided by the charter of Ireland." Would not the reader infer from this, that the Court of King's Bench was in existence at the time of *Magna Charta*? We need make no further remarks on the inconsistencies of the work. Let us, then, turn to something pleasant. In the essay on the Desmond family (page 254), we have the materials for a very pretty series of "Tales of a Grandfather," respecting the Hackett family, which, if the "author" will be so good as to impart to us, we may weave into the columns of the *Literary Gazette*, for the edification of the public, and the consolation of all the lineal descendants of Sir Paganus Hackett himself, who will, no doubt, now be all alive to the hereditary dignities of their family; and some of whom may, perhaps, be a little astonished at the "*spread eagle issuing from a ducal coronet, surmounted by a mitre proper*"—which is preserved to this day as the crest of the family, but respecting which, alas! no tradition explanatory is preserved: however, it is satisfactory to know that the arms are recorded—and where, good reader? why—in the most ancient collection of heraldic emblazements now remaining in Ireland, namely, *Mr. Robertson's*. Query, can this be the "extensive, valuable, and authentic collection of coach-painters' books," advertised in the *Morning Chronicle*, 12th May last, to be sold by Christie, on Monday, 17th May, at one o'clock. If so, what becomes of the hereditary dignity of the Hacketts? and all the old Irish and Scots family arms, many of which (as the advertisement saith) have genealogies for centuries back? besides some thousand French, Italian, and German coats, not to be found in any other collection in Europe, for the best of all reasons—like the crest of the Hacketts, they were the invention of the aforesaid coachmakers. Bless us! shades of Garter, Clarendieux, and Norroy, for centuries back, arise! and repel this foul slander! or let it go forth and choke itself, as most probably there are many existing coachmakers' collections quite as extensive as the one quoted; in any of which, however, it would be quite absurd to look for any tradition further than the usual statement of whether the bill was paid or not. The chances are, that Mr. Robertson was fortunate in not having any tradition attached to the entry of the arms.

Somewhat too much of this. If we had more of the documentary, and less of the author's historical and legal evidences (remarks), we should consider the book as valuable; but where such documents are gravely treated of, we should expect them to be accompanied by sound legal and accurate historical observations, and at all times, if not with more modesty, at least with less dogmatic assumption. And if the author does take upon himself to criticise the works of others (page 331), he should be careful at least that his work should be free from the offences which he attributes to theirs. Be it observed, that the introduction to the new edition of the Statutes, which is thus criticised by the author, is the joint production of the late Lord Colchester, Sergeant Taunton, and Sir Thomas Tomlins, who are accused of little acquaintance with the ancient legal history of Great Britain, and want of discretion!!!

The author is an Irishman. But is the title of author so new to individuals of that nation, as to call for its repetition throughout so many pages of the work? Indeed, so frequently does it appear, that a mischievous wag, on taking up the book in our study, to underscore the two words, "*the author*," actually spoiled nearly (together with our temper) one quarter of a hundred of our best pens.

The important announcement in the title, of "*Fellow of the Society of Antiquaries, &c., &c. &c.*," may be the mode in Ireland—here, we generally write F.S.A.; at all events, the latter method would have enabled "*the author*" to have gratified the public with, at least, the initials of some of those other learned Societies no doubt intended by the &c. &c. &c.

We shall now take our leave of Squire Lynch, with a recommendation equally applicable to any one who undertakes to support an hypothesis in opposition to received opinions, to be careful that, in selecting documents, he may not choose those which not only do not bear upon the case in point, but are in direct contradiction to it.

Mothers and Daughters, a Tale of the Year 1830.
3 vols. 12mo. London, 1831. Colburn and Bentley.

THIS is a lively and amusing work, belonging to the class of fashionable novels—but to the better class. It is quite one of the modern school,—no plot with difficulties to unravel, and mysteries to be disclosed; but it is an animated picture of society, with its ridiculous a little exaggerated—or perhaps not so much exaggerated, as taken in the extreme point of view. The characters are drawn with tact rather than depth; hence, however, they have the merit of being more generally true;—the motives of the many lie on the surface. The dialogues are very spirited,—the common-places of conversation are invested with an animation for which they ought to thank the author. Known persons and known events are turned to the best account; and considering the great body of readers whose chief amusement is to wonder "Who is meant by Lord Such-a-one, or Mrs. So-and-so," and who do not object to "*Roscius*" self for being second-hand," the writer has, at all events, fallen in with a pretty general taste of the times. Whether this taste be a good one or not, we have no space to discuss; but it shews talent in an author to perceive, and still more talent to fall cleverly in with it. By the by, the donors of the fête at Boyle Farm little knew the service they were rendering the literature of their day;—this is the third novel in which that fête has been described, and has led to some important event. A late divorce has been equally serviceable; being absorbed in politics is now the reigning cause for matrimonial neglect in these fictitious annals. French in their philosophy, French in their style, these pages remind us of some of the cleverest memoirs of Parisian literature. They are a collection of excellently sketched portraits, of amusing conversations, of descriptions of passing events, balls, dinners, wound together, with a little love and a good many marriages. They are, indeed, part and parcel of the social history of the times. Not an historical romance after Sir Walter Scott, only enacted in modern days; but rather "*chronicles scandaleuses*," like those of Comines, and, like those chronicles, with nothing of what is commonly called scandal in them.

The first volume is by far the best: real life has given the characters, and Rochefoucauld the theory; and besides being amused with the

progress of the narrative, no one could deny high praise to the talents which bring out the various motives into action. We select the sketch of a love match, by way of specimen.

"Lady Maria Willingham was a person who, with indifferent features, had always managed to be called pretty; with very moderate abilities, had maintained the reputation of being extremely clever; and with a narrow selfish heart, was continually cited as the most excellent woman in the world. The tact which had thus universally enabled her to assume a virtue where she had it not, was of course a qualification of no feeble force. Early in her fashionable career it had whispered to her, that a dress of the last new Parisian mode was an admirable mask for the body; an earnest, and deliberate, and mysterious tone of conversation, a most imposing cloak for the deficiencies of the mind; and she was well aware that the heart is usually taken upon the trust of these preceding and more ostensible endowments. She therefore confined the demonstrations of her virtue to a refrainment from all sins unrecognised as of the highest ton; and to a pathetic vibration of the head and elevation of the eyes, whenever the delinquencies of other people came under discussion. In one respect Lady Maria had appeared to rise superior to her own failings, and to have suffered a remission of her callous egotism;—she had made what is called a love match. But love, like other sad dogs with an ill name, is rendered responsible for many a crime, in addition to his own unjustifiable criminalities; and if ever Cupid could have proved his innocence by an *alibi*, it was most assuredly in the instance of Charles Willingham's elopement with Lady Maria de Vecchi! I have already asserted that she was neither handsome, clever, nor amiable. At the period of what was termed her '*rash marriage*,' she was nearly five-and-twenty, with a portion of three thousand pounds, Irish currency; and attached, as a Bath and Cheltenham appendage, to a deaf mother, the duldest dowager extant throughout the united realms of Great Britain. At Ramsgate, where, through her qualification of '*ladyship*,' Lady Maria maintained a very creditable degree of ball-room precedence, the De Vecchi became acquainted with Mr. Willingham, the eldest son of a family of opulence and county antiquity. He was fresh from college, or rather, he had still a term and a degree in prospective endurance; being three years younger than the fair tactician from Bruton Street, who had brought the faded looks and blighted hopes of another infertile season to be repaired by the breezes of the Isle of Thanet. After dancing, riding, walking, and flirting together, with the assiduity becoming a watering-place, Charles Willingham very properly fell in love, and Lady Maria very naturally fell into a fit of musing. She considered that her lady-mother was paralytic, that her lordly brother and his wife were far gone in severe evangelism, that her prospects were extremely precarious, and her means most unaristocratically limited; and in consequence of these lamentable coincidences, she thought it, on the whole, advisable to sigh and grow sentimental in honour of poor Charles and his honest passion; and to sanction with her smiles his application to his father for a maintenance, and to her own maternal countess dowager for her hand. Unfortunately the replies of both were unpropitious. Sir Claude Willingham having a favourite second son, was by no means anxious for the early marriage of his heir-apparent, and consequently restricted his promise of an income for the young couple

to a thousand a-year; and on the receipt of this almost interdictory intelligence, the dowager, whose head had been shaking for years past with the palsy, redoubled its movement in negative vehemence. 'Her consent to such a miserable match for her dear Maria? Never! She could not hear of it with patience. Like other stupid old women, poor Lady De Vesci, however, contrived to defeat her own views on the subject. At all times a bore of the most stupendous magnitude, she grew thrice doubly tiresome under the irritations of the disaster which threatened her domestic peace. She concentrated all her prose into ceaseless diatribes against the folly and wickedness of improvident marriages, and the thriftless frivolity of the young men of the age; and she insisted on keeping her superannuated kitten perpetually under her own eye in a stifling Ramsgate parlour, enlivened only by an elaborate effort in lambswool knitting, and the daily lecture in the *Globe* newspaper. Lady Maria had been long compelled to evening casino;—it was now hinted as a morning recreation, by way of sedative. In vain did Charles Willingham languish on the pier, and mope upon the cliffs; her ladyship was secluded as strictly as a nun of any sisterhood in Spain. He fixed his gaze upon the daily airings of the dowager's chariot, and indited a sonnet thereupon; then thought of the Cambridge horrors of his ensuing term, until his grief absolutely expanded itself into elegiac stanzas! Both effusions, accompanied by an epistle in simple prose, far more to the purpose, he bribed towards the dressing-table of Lady Maria; who, having no feelings of filial reluctance to subdue, finally ceded to the united influence of three such tender misivies; and to escape from a dreary home and beggarly prospects, ran away with him on the following morning, and was always said to have perpetrated a love-match! So much for the judgment of the world!"

The contrast between the two sisters-in-law is touched with the neatness of a camel's hair pencil; and the discontented duchess, the fair and speculating sisters, &c. would be exquisitely finished pictures in any moral portrait gallery. We cannot but remark in passing, that it is in painting faults and follies that our author excels; she draws the weak, the vain, if not with "all her heart," with "all her head." All her good people are as dull as good people too often are. Mary Willingham is a most exemplary young person, but certainly a very uninteresting one.

Though we have given only one extract from this work, and classed it among the fashionable novels of the day, we ought to say that, in our opinion, it possesses merits to raise it above that class, as it has hitherto generally provoked our criticism. If fairly and wittily done, we see no cause why the upper ranks should not have their chroniclers, as well as any other grade of society; and it is against the slip-slop of pretenders and mere book manufacturers, who have never had access to the drawing-rooms of even middle life, that we have set our face. This work, on the contrary, strikes us as being the production of one who has seen the follies she satirises. Whoever the author may be,—we should think a lady, and with some masculine assistance, to account for many of the touches we see scattered over these pages—she has acquitted herself most satisfactorily.

Upon the whole, then, so far from condemning *Mothers and Daughters*, by applying to it the denigratory phrase of *fashionable novel*, we ought in justice to except it as a rare instance

of being what it purports to be, and a very lively and amusing panorama of actual life.

Paris's Life of Sir H. Davy.

(Second notice.)

WE resume our notice of Dr. Paris's *Memoirs of the Life of Sir Humphry Davy*,—a work which is fully calculated to repay the most attentive perusal of every class of readers, both on account of the strong interest that must ever attach to the personal memoirs and scientific career of the late President of the Royal Society, and of the great industry which the biographer has shewn in the collection of his materials.

"The most prominent circumstance (observes our author) in the history of this period of Davy's life, (his nineteenth year,) is his introduction to Mr. Davies Giddy, now Mr. Gilbert, the late distinguished president of the Royal Society. The manner in which this happened is as curious as its result was important; and it furnishes another very striking illustration of the power of simple accident in directing our destinies. Mr. Gilbert's attention was attracted to the future philosopher, as he was carelessly swinging over the hatch or half-door of Mr. Borlase's house, by the humorous contortions into which he threw his features. Davy, it may be remembered, when a boy, possessed a countenance which, even in its natural state, was very far from comely; while his round shoulders, inharmonious voice, and insignificant manner, were calculated to produce any thing rather than a favourable impression. In riper years he was what might be called 'good-looking,' although, as a wit of the day observed, his aspect was that of the 'bucolic' character. The change which his person underwent, after his promotion to the Royal Institution, was so rapid, that in the days of Herodotus it would have been attributed to nothing less than the miraculous interposition of the priestess of Helen. A person who happened to be walking with Mr. Gilbert on the occasion alluded to, observed that the extraordinary-looking boy in question was young Davy the carver's son, who, he added, was said to be fond of making chemical experiments. 'Chemical experiments?' exclaimed Mr. Gilbert, with much surprise; 'if that be the case, I must have some conversation with him.' Mr. Gilbert, as we all know, possesses a strong perception of character, and he therefore soon discovered ample evidence of the boy's singular genius. After several interviews, which confirmed him in the opinion he had formed, he offered young Humphry the use of his library, or any other assistance that he might require for the prosecution of his studies; and at the same time gave him an invitation to his house, of which Davy often availed himself."

Another anecdote given by the biographer also shews how much accidental circumstances govern the fate, or rather the progress, of individuals.

"During the following year an event occurred which contributed in no small degree to the advancement of Davy's prospects. Mr. Gregory Watt, who had long been in a declining state of health, was recommended by his physicians to reside for some time in the west of England; and he accordingly proceeded at once to Penzance, and took up his abode as a lodger and boarder in the house of Mrs. Davy. It may be supposed that two kindred spirits could not be long in contracting an acquaintance with each other; in fact, an intimacy of the warmest nature did ultimately grow up between them, and continue to the very moment of Mr. Watt's premature dissolution.

The origin and progress of their friendship was, however, too curious to be passed over without a slight notice. Davy sought to ingratiate himself with Mr. Watt by metaphysical discussions; but, instead of admiration, he excited the disgust of his hearer. It was by mere accident that an allusion was first made to chemistry, when Davy sippantly observed, that he would undertake to demolish the French theory in half an hour. He had touched the chord, the interest of Mr. Watt was excited, he conversed with Davy upon his chemical pursuits, he was at once astonished and delighted at his sagacity, the barrier of ice was removed, and they became attached friends. Mr. Wedgwood and his brother Thomas also spent a winter at Penzance; and I have reason to believe that their friendship was of substantial benefit to young Davy."

The next incident in the history of our juvenile philosopher was his introduction to the late Dr. Beddoes, an event from which may be dated, in a great measure, the rapid progress he made, both as an experimental chemist and public lecturer, and which formed the immediate precursor to his engagement as assistant, and soon afterwards principal lecturer on chemistry at the Royal Institution.

The following extracts afford so beautiful a specimen of the inductive genius of Davy, in his earlier philosophical researches, and which, perhaps more than any other quality, contributed to raise him to the highest pinnacle of chemical renown, at the same time that it forms the first indications of his attention to the highly important branch of science termed agricultural chemistry, that we cannot resist its quotation. In a letter to his excellent friend Mr. Gilbert, while engaged in some experiments at the Pneumatic Institution at Bristol, he says:

"One of Mr. Coate's children accidentally discovered that two bonnet canes rubbed together produced a faint light. The novelty of this phenomenon induced me to examine it, and I found that two canes, on collision, produced sparks of light as brilliant as those from the flint and steel. On examining the epidermis, I found, when it was taken off, that the canes no longer gave light on collision. The epidermis, subjected to chemical analysis, had all the properties of silex. The similar appearance of the epidermis of reeds, corn, and grasses, induced me to suppose that they likewise contained silex. By burning them carefully, and analysing their ashes, I found that they contained it in rather larger proportions than the canes. The corn and grasses contain sufficient potash to form glass with their flint. A very pretty experiment may be made on these plants with the blow-pipe: if you take a straw of wheat, barley, or hay, and burn it, beginning at the top, and heating the ashes with the blue flame; you will obtain a perfect globule of hard glass fit for microscopic experiments."

Can any thing afford a stronger evidence of that originality of mind which distinguished this eminent chemist through his early career, than tracing out the constituent elements of glass in a blade of grass?

The numerous experiments which Davy made upon himself, by inhaling the various deleterious gases, in order to ascertain their effect on the animal economy, are well known to all scientific readers; but we feel the following judicious remarks of Dr. Paris on those truly hazardous experiments too important to omit their quotation:—"The scientific and medical world are alike indebted to Davy for this daring experiment (breathing carbureted hydrogen gas); and if the precautions it suggests be properly at-

tended to, it may become the means of preserving human life. The experiment is also valuable, as affording support to physiological views with which its author was probably unacquainted. In the first place, it may be necessary to apprise some of my readers, that the *hydro-carbonate* here spoken of differs very little from the gas now so generally used to illuminate our streets and houses. We have just seen how deadly are its qualities, and that even in a state of extreme dilution, it will affect our sensations. The question, then, naturally suggests itself, how far this gas can be safely introduced into the interior of our apartments? Did we not possess any direct evidence upon the subject, the answer would be sufficiently obvious, since it is impossible so to conduct its combustion that a portion shall not escape unburnt. Such is the theory; but what is our experience on the subject? That pains in the head, nausea, and distressing languor, have been repeatedly experienced in our theatres and saloons, by persons inhaling the unburnt gas: that the atmosphere of a room, although spacious and empty, will, if lighted with gas, convey a sense of oppression to our organs of respiration, as if we were inhaling an air contaminated with the breath of a hundred persons. In the next place, Davy's experiment is important, inasmuch as it proves, that in cases of asphyxia, or suspended animation, there exists a period of danger after the respiration has been restored, and the circulation re-established, at which death may take place, when we are least prepared to expect it. Bichât has shewn that, when dark-coloured blood (venous) is injected into the vessels of the brain, by means of a syringe connected with the carotid artery, the functions of the brain become immediately disturbed, and in a short time entirely cease. The effect is precisely similar, whether the dark-coloured blood be transmitted to the brain by the syringe of the experimentalist, or by the heart itself: Thus, in the case of asphyxia, the dark-coloured blood which has been propelled through the vessels during the suspension, or imperfect performance, of respiration, acts like a narcotic poison on the brain; and no sooner, therefore, does it extend its malign influence on that organ, than deleterious effects are produced, and the animal, after apparent recovery, falls into a state of stupor, the pupils of the eyes become dilated, the respiration laborious, the muscles of the body convulsed, and it speedily dies—poisoned by its own blood."

"In the experiment which has given origin to these reflections (adds Dr. Paris), Davy distinctly states, that after having recovered from the primary effects of the carburetted hydrogen gas, and taken a walk with his friend, he was again seized with giddiness, attended with nausea and loss of sensation. The imperfectly oxygenised or dark-coloured blood had evidently affected the brain, and his life, at this period, was probably in greater jeopardy than in any other stage of the experiment."

The preceding remarks on the deleterious effects of respiring carburetted hydrogen, as well as those which follow, concerning the extreme boldness of our late distinguished chemist in attempting to inhale the still more poisonous gas, carbonic acid (the choke-damp of miners)—are entitled to the most serious attention of every class of readers who may be exposed to the depraved atmosphere which results from the use of gas-lights, or the unventilated passages and cellars of buildings.

(To be continued.)

The Working-Man's Companion: The Results of Machinery. Under the superintendence of the Society for the Diffusion of Useful Knowledge. 12mo. pp. 216. London, 1831. Knight.

In the apparent momentary failure even of the severity of the law to stay the progress of mischievous incendiaries and machine-breakers, and of still further use to enforce the exhortations of the religious and the peaceable,—we have here a direct appeal to the judgment of the working-classes; and it will be impossible for any man to peruse carefully the well-chosen and well-digested facts contained in this little volume without being convinced of the folly and absurdity of his hatred of machines, and his criminal acts to prevent their employment, or to attempt, by unavailing violence, "to check that which must go forward."

The author has brought before us a great body of facts to shew, that through the power of machinery the working men of this country possess, however poor they may be, many of the comforts which make the difference between man in a civilised and man in a savage state; and further, that in consequence of machinery having rendered productions of all sorts cheaper, and therefore caused them to be more universally purchased, it has really increased the demand for that manual labour which, it appears to some of them, reasoning only in a few instances, it has a tendency to diminish. Independently of all considerations of momentary interest, the work possesses many other claims to an attentive perusal even by classes for whom it is not designed, yet from whom we are sure it will meet with a cordial reception.

Proper Lessons to be read at Morning and Evening Prayer on the Sundays and other Holydays throughout the Year. Oxford, 1831, Clarendon Press: London, Gardner; Whitaker: Derby, Mozely and Son; York, Wilson and Sons.

ALL the lessons for the year read in the Church of England, printed separately from other religious matter, in a beautiful little volume, is a publication worthy of the most grateful reception.

The Infant's Daily Sacrifice. Pp. 75. London. Hatchard and Son.

A SWEET little book of short hymns for children, and adorned with many appropriate plates. It is a delightful composition, in the purest, the kindest, and the most truly Christian spirit; pious without austerity, and admirably calculated to make a right impression on the minds of children.

A Narrative of the Peninsular War. By Major Leith Hay, F.R.S.E. 2 vols. 12mo. Edinburgh, D. Lizars; London, Whittaker and Co.

A LIVELY narrative, founded on personal observation, even after the numerous and laborious volumes which have been published on the events of this remarkable struggle, ought to find favour with the British reader; and such being the character, such we may hope will be the success, of Major Hay's work. The gallant officer saw much service, and was in the midst of many an extraordinary scene. Of these he has drawn evidently true, as well as interesting, pictures; and though we do not find it indispensable to quote from his pages, at this overwhelming season of novelties, we trust that

the expression of our satisfaction on perusing them, may lead many to enjoy the same pleasure.

Castle's Manual of Surgery, &c. 3d edition. pp. 515. London, E. Cox.

THE words "third edition," in the title-page, render laudatory notice unnecessary: and we will only say we think them deserved. The volume is enlarged, and has notes added from the works of other distinguished surgeons.

The Life of Titian. By J. Northcote, Esq. R.A. [Second Notice.]

IN a former No. we mentioned our intention of quoting Mr. Northcote's chapter "On the encouragement of art in England and Italy." Parts of it are too bitter for our taste; and it contains some assertions, in the accuracy of which we do not entirely concur; but as the frank and earnest expostulation of a man of acknowledged talents, it is entitled to respectful attention. We find, however, that, though ready printed for our *Gazette*, we must cancel it, and be content to refer our readers to the original; and especially all who are interested in the cultivation of the Fine Arts. The pressure of new and important works upon us at this period forces us to relinquish the task which we would otherwise have cheerfully performed; for Mr. Northcote's essay on this subject is full of excellent matter.

ARTS AND SCIENCES.

SOCIETY OF ARTS.

AT the meeting of the Society on Wednesday evening, the gold Isis medal and fifty guineas were voted to Mr. Andrew Ross, for his new dividing engine.—Mr. Ross's communication consists of two parts. The first is a mode of obtaining the divisions for circular dividing engines, depending, in the main, on the same principles as have already been employed, but varied in some of the details. Mr. Ross first divides his circle into forty-eight parts by continued bi- or tri-sections, or by a combination of each method. The points thus formed being carefully marked on the limb of the circle, the intervals are then subdivided in the following manner:—An arc, equal to one of the spaces to be subdivided, is procured, and is divided as correctly as can conveniently be done, and to the same degree of minuteness as it is intended to divide the plate of the engine. The radius of this arc is to be equal to that of the engine; and whatever errors there may be in its original divisions are corrected by the following process:—A second arc, having an angular value equal to the first, with a radius only one-half or one-fourth as great, is, together with the first, attached and made concentric with the plate of the engine. The divisions of the first are transferred by means of radial lines to the second, the spaces between them being, of course, diminished in proportion to the radii of the respective arcs. When the second arc has received a counterpart of the divisions of the first, it is placed on the circumference of the engine plate, and there fixed so that the divided arc shall occupy exactly its proper angular space on the limb of the plate. The divisions of the second arc are then transferred to the first or larger one, a single interval on this latter comprising two or four on the former, according as the radius of the one is twice or four times as great as that of the other. In this manner, the errors of any particular intervals become gradually distributed among the rest, and by repeating the process a sufficient

number of times, are reduced to invisible quantities.—The second part of Mr. Ross's communication consists of a description of the apparatus by which the divisions of the engine plate, corrected as above described, are transferred to the arc of circles of other instruments. This is usually done by means of small teeth, cut on the edge of a large horizontal wheel; these teeth being acted upon by an endless screw, about an inch in diameter. The truth of such an engine depends, first, on a perfect equality between all the teeth in the wheel; and, secondly, in an equality in all parts of the spiral formed by the threads of the screw, as well as in the inclination of those threads. The obstacles to perfect success in these particulars, arising from slight differences in the density of the metal, or in the sharpness of the cutter, are such as have perhaps never been entirely overcome by the most celebrated artists, however nearly they may have approached it; and the wheel and screw, when once out of the maker's hands, are no longer susceptible of any correction, whatever errors may be discovered. Mr. Ross's engine consists likewise of parts, which act as a toothed wheel and endless screw, but so constructed, that each tooth of the wheel, and every part of the screw, admit of unlimited correction and adjustment by the person using it. The teeth of the wheel are only 48, and consist of brass cocks, into which are tapped steel screws, the axes of which lie in the plane of the wheel, and at their ends are tangents to the circumference. These ends being ground perfectly flat form the virtual faces of the teeth, and are capable of being at any time advanced or withdrawn: they give, therefore, to the wheel that perfect and constant power of adjustment which has been mentioned. The same power is obtained for the endless screw, by forming it of one deep, thin thread, winding round a cylinder four or five inches in diameter. Into this thread are tapped 90 screws, at equal distances, having their axes parallel to that of the cylinder: the ends of these screws form the stops to those in the cocks of the wheel, and, like them, are capable of easy and unlimited correction. Thus the circumference of the wheel is divided into 4,320 equal spaces, every one of which may afterwards be corrected, if required.

On Tuesday evening the first illustration for the season was given. Mr. David Pollock, one of the vice-presidents, took the chair, and stated that the rotation of these evening illustrations had not yet been finally arranged; Mr. Aikin, the secretary, however, would deliver some observations on the silk manufactures at the next meeting, by which time the course of illustrations for the whole session would be fixed upon, and communicated to the Society. On the present occasion Mr. Deville would address the meeting on the art of casting in plaster. Mr. Deville having taken his place at the lecture-table, remarked on the difficulty of obtaining good plaster of Paris in the French capital; all the casts in the gallery of the Louvre were composed of the best plaster, made from Newark stone, exported from England for that purpose. Mr. D. then minutely described the process of mixing the plaster with river water, strengthening it with a little malt liquor!—avoiding salt, which, though it tended more rapidly to settle the plaster, in a short time corroded the bust, giving it the appearance of decayed outline. The evils of the plaster becoming posted, or catching cold (we use the artist's own phrase), were then glanced at, and the student and amateur cau-

tioned on the subject. On one occasion, having caused expansion by an injudicious application of the plaster to a female marble bust, the neck broke under the hands of the workman; and the artist himself, before he was allowed to model from the famous busts of Sir Isaac Newton and Lord Bacon, in Trinity College, Cambridge, had to give a bond for the payment of 1000*l.*, in case they should sustain damage from the same cause, or otherwise; moreover, he was bound by the contract to model with his own hands. Mr. Deville then went into a long practical explanation of his subject, the details of which would not be very interesting to the general reader. The meeting-room was unusually crowded.

ROYAL GEOGRAPHICAL SOCIETY.

THIS Society met on Monday evening for the first time after the holidays; G. B. Greenough, Esq. V.P. in the chair.—After reading minutes of the previous meeting, list of donations to the Society's library, and other formal matters, a communication was read, addressed to the Society by Captain Smyth, R.N., regarding the Columbrete, a small group of volcanic islets near Majorca, the largest of which Captain S. identifies with the Ophiusa of the ancients, in opposition to the French and some other writers, who conceive Formentera to be the island thus named. His arguments are chiefly founded on the quantity of serpents found in it, therein agreeing with the accounts given of Ophiusa; whereas the inhabitants of Formentera boast that no venomous reptile can live upon it: besides which it appears probable, from other circumstances, that Formentera was the Pityusa Minor of antiquity, as Iviza was the Pityusa Major. The position of Captain Smyth's observatory erected on the Columbrete, (in conveying which to its place, by the way, the seamen were absolutely impeded by the number of serpents, from two to three feet long, and finely striated with dark zigzag lines on a bright yellow ground,) was lat. $39^{\circ} 53' 58''$ N., long. $0^{\circ} 44' 27''$ east of Greenwich. Formation, purely volcanic; vegetation, dwarf olives, geraniums, prickly pears, myrtles, and brush-wood; zoology, exclusive of serpents, chiefly rabbits, with abundance of crabs and other shell-fish along the shores; a tolerably good circular harbour, with from five to twelve fathoms water in it—bottom but indifferent: and it is said that fresh water can be procured by digging, but Captain Smyth did not find it.—After this, an extract was read from the log of the private ship Layton; Hurst master, which, in February last, discovered a very dangerous reef, or rather group of low, rocky islets, in lat. $8^{\circ} 40'$ N. long. by chronometer $149^{\circ} 30'$ east of Greenwich, situated consequently between the group called Hogolen and the island marked Anonyma in Krusenstern's chart of the Pacific, but which, in some other charts, is called Falo, or Lamurah, both belonging to the Caroline chain. Thanks were voted to the respective contributors of the above papers, and the meeting adjourned.

We understand that the council of this Society has it in contemplation, instead of publishing exclusively its own transactions, to edit a journal of geographical science generally, in which it will include, with its own papers, reviews and analyses of geographical works, whether published at home or abroad, translated extracts from foreign journals; in a word, recent and interesting-geographical and statistical information from all quarters, and howsoever obtained; the object being at once to communicate to the English reader what is gaining

abroad, to the foreign reader what may be acquiring at home, and to both the assistance which an impartial analysis and comparison of their respective labours is calculated to bestow. Another portion of the plan is, we believe, by making it thus a first object to collect foreign and domestic geographical works of modern date, and however fugitive in their nature, to facilitate reference to members, by keeping them regularly filed and catalogued in the Society's library, and accessible in its reading-room. And the whole, we are persuaded, will greatly extend both the usefulness and popularity of the Institution.

CAPTAIN ROSS.

WE anticipated hearing of this adventurous navigator on the return of the North Sea whalers. The last No. of the *Edinburgh New Philosophical Journal* contains two paragraphs—one relates to his detention in Baffin's Bay, and refitment from the wreck of a Greenland ship, and of which we have already given an account;—the other represents our brave commander and his crew as having been forced back to Lively Bay, in Baffin's Bay, where they spent last winter.

NEW COMET.

SOON after six o'clock on the morning of the 7th of January, Mr. John Herapath, at Cranford, discovered a brilliant comet in the east, a few degrees above the horizon. He states it to equal a star of the second magnitude, with a tail of from 1 to 2° in length. At about a quarter to seven it was $60^{\circ} 49'$ from Arcturus, and $52^{\circ} 44'$ from Alpha in Lyra; so that, says Mr. H., "by a rough projection, its place was Sagittarius $22\frac{1}{2}^{\circ}$, with 11° north latitude." Sir James South has also seen and ascertained this comet: our own Astronomer Royal for the *Literary Gazette* reports to us—"A comet has been observed in the constellation Ophiuchus. The unfavourable state of the atmosphere during the whole of the present week, has prevented any opportunity of tracing its course."

LITERARY AND LEARNED.

ROYAL SOCIETY.

ON Thursday evening the sittings were resumed after the recess; J. W. Lubbock, Esq. V. P. in the chair. Part of a very important paper, an analysis of which we shall give hereafter, was read. The communication is entitled, "on the equilibrium of fluids, and the figure of a homogeneous planet in a fluid state," by James Ivory, Esq., F.R.S. Dr. Paris presented a copy of his *Life of Sir H. Davy*. Several other scientific presents were made to the Society. The Earl of Selkirk, in pursuance of a notice given at the former meeting, was proposed by Professor Powell, of Oxford, for immediate ballot, and was elected a Fellow.

SOCIETY OF ANTIQUARIES.

JANUARY 13. Thomas Amyott, Esq. treasurer, in the chair. The Secretary concluded the reading of Mr. Woodward's paper, descriptive of the remains of Roman camps, roads, and stations, in the county of Norfolk, and of Roman pigs of lead, rings, coins, &c., which have been found at various places in that county.

FAIRFAX MANUSCRIPTS AND AUTOGRAPHS.

MR. CHRISTIE this week concluded a three days' sale of the books and manuscripts brought from Leeds Castle, in Kent, of which he last year sold the furniture and paintings. The

collection of printed books contained little of importance, consisting, apparently, rather of the remains of a family accumulation than of a library. The most important article in it, if the amount it produced may be considered as a criterion, was a copy of the Bible, in English, printed in 1549, which was knocked down for 53*l.* 11*s.* to Mr. Thorpe. This high price, however, chiefly arose from the circumstance of its containing several entries of the births of the celebrated Fairfax family, the former possessors of Leeds Castle, and who for so long a period figured very conspicuously in our annals, poisoning at one time, during the civil wars, the fortunes of the English monarchy. The Bible, therefore, might be considered rather as a manuscript than a printed book. The paucity of the collection of printed works was amply made up by the richness and importance of that of the manuscripts, which contained several of great curiosity and interest. It consisted of the family muniments of the Fairfaxes for several centuries; as well of the Yorkshire property as of their possessions in Kent; and of others acquired by them either from family connexion or purchase. Among the latter were several original papers and writings of Selden, and of the learned and laborious editor of his works, Dr. David Wilkins, the Anglo-Saxon scholar, compiler of the *Concilia Britannica*. The following lots were the most important during the sale, with the prices they brought:—

First Day.—Le Livre qui parle des Diversités des Pais, compilé par Meistre Jehan Mandeville, on vell. 12*l.* 12*s.*
Le Testament, Maître Jehan de Mehus, on vellum, 7*l.* 7*s.*

The Question! Tuscane di Cicerone, on vell. 8*l.* 15*s.*
A Psalter, written in large characters, on vellum, with early illuminations, and the Autograph of Charles Fairfax, 45*l.* 3*s.*

A Missal, written in characters of gold and silver, upon a black ground, the borders embellished with flowers, 13*l.* 2*s.* 6*d.*

The MSS. in the *second day's* sale consisted entirely of Papers and Letters of the Fairfax family, among which were several connected with the affairs of the witty and profligate George Villiers, Duke of Buckingham, who married the daughter of the celebrated parliamentary general, Thomas, Lord Fairfax.

A large Collection of Letters, addressed to Brian Fairfax, including many of the Nobility and Political characters, 15*l.* 15*s.*

A similar Collection, 14*l.* 3*s.* 6*d.*

An interesting Collection of Papers relating to the Duke of Buckingham's commitment to the Tower; among which are four rough copies of Letters in the Duke's own hand to Charles II., 6*l.* 6*s.*

Third Day.—Copy of the Will of Lord Ferd. Fairfax, and various other Papers, 21*l.* 10*s.*

Mercurius Trismegistus, called Pimander, in the hand-writing of Gen. Lord Thomas Fairfax, 10*l.* 10*s.*

Brian Fairfax's Account of his being sent on a secret Message from Lord Fairfax to General Monk, in his own hand-writing; and Brian Fairfax, his Journal, commencing 1696, 15*l.* 15*s.*

Some Anecdotes of the Fairfax Family at the time of the Commonwealth; and 4 other vols., with Copies of Letters and Extracts, 16*l.* 5*s.* 6*d.*

A volume by Brian Fairfax, containing Acquittances from the Duke of Buckingham's Creditors, some passages of his Life, Memorandums concerning General Fairfax, &c. &c., on paper, 6*l.* 6*s.*

Short Memorials of some things to be cleared during my command in the South, in the hand-writing of Sir Thomas Fairfax, in old morocco; and 2 rough copies of the same, 32*l.* 1*s.*

A Discourse on Witchcraft, as it was acted in the Family of Mr. Edward Fairfax, 1631; and another copy of the same, in folio, 11*l.* 11*s.*

A collection of Memoranda, chiefly in the hand-writing of Henry Fairfax, the brother of Ferdinand Lord Fairfax, relating to the Genealogy of that and other English Families, 31*l.* 10*s.*

Analecta Fairfaxiana, a very curious and interesting volume on vellum, in the hand-writing of Lord Thomas Fairfax, first Baron of Cameron, containing the arms, pedigrees, monuments, and other matters relating to the family of Fairfax; with an account of the deaths of William and John Fairfax, slain in the Palatinate, and Peregrine, who was killed in France. With an Index to the whole, 108*l.* 3*s.*

Analecta Fairfaxiana; being the rough copy, on vellum,

of much of the preceding volume, bound in blue morocco, 58*l.* 10*s.*

A very interesting Collection of Letters and Papers relating to the Siege and Surrender of Pomfret Castle, including nine Letters of Oliver Cromwell, others by Lambert, Morris, Cholmeley, Charles Fairfax, Thomas Wentworth, son of the Earl of Strafford, and many others; written during the siege, 1667.

Ordinances touching the King's Household, made in the time of Edward the Second; translated out of an old French copy in 1601.—The manner of Making New Servants.—Narration of the Services done by the Armie at Loughfoill, 1614; and other curious matters, with two Autographs of E. Ashmole; bound in one volume, 31*l.* 10*s.*

An English Chronicle, to 1417, on vellum, imperfect; and Magna Charta, and other English Statutes, on vellum, imperfect, 42*l.*

List of Offices in the different Courts, made out in the time of Edward VI., and added to in the reign of Elizabeth; on paper, and a Survey of the Revenue in the reign of Edward VI., 42*l.*

An Inventorie of the Personall Estate of the late King (Charles I.), which was sold by Act of Parliament, and in order to the Sale appraised as followeth. This curious volume has the prices affixed to the different items, and the names of the purchasers, 21*l.*

A Catalogue of those Pictures of the Duke of Buckingham which were sent to him and sold in Antwerp during his exile.

Several others of the lots were of much interest in respect to Parliamentary history, to statistics, and to what we should now call political economy. These, however, we need not particularise. The sale was principally remarkable for its produce, and seemed to revive the era of excessive competition for property of this kind, and especially for autographs. The sellers were, we believe, very agreeably disappointed by the results, and probably one of the most considerable purchasers was no less gratified. We allude to Mr. J. N. Hughes, of Maidstone, the possessor of a fine collection of manuscripts, &c. of the time of the civil wars; and who must have rejoiced to see single papers knocked down at twenty, thirty, forty, fifty, to above a hundred pounds, of the same kind with those of which we are informed he himself purchased two sacks fullas waste paper, at the price of five pounds!!

We have only further to notice, that the other great purchasers were Sir Thomas Phillips, Bart., and Mr. Thorpe, Mr. Cochrane, and Mr. Rodd, Booksellers.

FINE ARTS.

NEW PUBLICATIONS.

Landscape Illustrations of the Waverley Novels. Engraved by W. and E. Finden. Part IX. Tilt.

FOUR pleasing views. That of "Kenilworth Castle," from a drawing by P. De Wint, and that of "Durstafraige Castle," from a drawing by G. F. Robson, are our favourites.

Messrs. Thomas Welsh, J. H. Wallack, and John Parry. Engraved, the first two by B. Holl, the last by Hicks, from drawings by A. Wivell.

VERY characteristic resemblances; the one of Mr. Parry especially. We can almost fancy that sociable and kind-hearted individual is about to draw his pretended snuff-box from his pocket, for the purpose of delighting his friends with some of the beautiful melodies of his native land, performed with his usual taste and feeling, on that charming little instrument the symphonion.

The Art of Miniature-Painting on Ivory. By Arthur Parsey, Professor of Miniature-Painting and Perspective. 12mo. pp. 184. London. Longman and Co.

ALTHOUGH there is much in this little treatise which might have been advantageously omitted, the student of the delicate and pleasing branch of the fine arts upon which it treats,

may gather a great deal of information from it, especially with reference to the selection and preparation of ivory, the choice of pencils, the quality of colours, the composition of tints, the progressive stages of a miniature, the various modes of handling, and, above all, the management of the scraper. We perfectly agree with Mr. Parsey, that the value of this instrument has not yet been adequately appreciated; and that, by the free but judicious use of it, effects may be produced, which it would be in vain to endeavour to obtain by any other means.

It is to be regretted that Mr. Parsey did not submit his work to the revision of some literary friend before he sent it to press. The style in which it is written is singularly incorrect and obscure. Elegance of composition may be dispensed with in such a production; but perspicuity is absolutely necessary.

Lord Byron at the Age of Nineteen. Painted by G. Sanders; engraved by W. Finden. Moon, Boys, and Graves.

THERE is, perhaps, no artist of talent in this country whose name is so little known to the public at large as that of Mr. Sanders; a circumstance which is owing in part to his practice having been principally confined to the higher circles of society, and in part to his having abstained from sending his works either to Somerset House, or to any of the other exhibitions in the metropolis. Those, however, who have occasionally seen Mr. Sanders's pictures, know that he is a painter of considerable vigour and taste; that he never condescends to common-place; and that his productions evince great originality of conception, tempered and guided by much observation of the finest remains of ancient art. The composition under our notice is a happy specimen of his powers. It is, in every respect, the most interesting representation that we have met with of a man, whose poetical fame—however deeply the stains upon his moral character may and must be deplored—will co-exist with the English language. Mr. Finden has done his subject great justice.

MUSIC.

NEW PUBLICATIONS.

Melodies of various Nations. Vol. IV. Goulding and D'Almaine.

WITH the symphonies and accompaniments by Bishop, and the poetry by T. Haynes Bayly, this delightful volume well maintains the high character of its precursors. "I'll find you out" is one of the liveliest of songs, and "Oh smile not upon me" one of the sweetest and most plaintive. But we could name six of the twelve as especial favourites with us; only it would be doing injustice to the other six.

The Cadeau. 1831. Johanning and Whatmore.

WHAT! more? Another musical Annual, the music by W. Neuland, and the "poetical department" by F. W. N. Bayley. This work is very prettily got up, and the decorations (lithographic) are superior to most publications of the same class. The first song is extremely sweet, and the whole volume abounds with light Swiss airs, gallopadas, mazurkas, waltzes, &c. &c. Altogether, it is a very appropriate Christmas, new year, or birth-day gift.

Cheltenham Hart's First Set. The Adelaide or Royal Quadrilles, &c. Mori and Lavenau.

THE first tune is enough to put a whole assembly of quadrillers into good humour for all the rest, even were they not so pretty as they really

are. The music is well arranged for the piano-forte, and the figures simple and pleasing. In effect, they are certainly calculated for the end rather than the beginning of the ball, as the first and last quadrilles are very lively.

'Tis Midnight; a Ballad. Romeo and Juliet; a Duet. London, C. J. Farn.

THE words of the first by Mr. Haynes Bayly, the music of both by Mr. Severn, the composer of "Oh sing me no new songs to-night!" and the Songs of the Boudoir. "'Tis midnight" is a beautiful song, and admirably adapted. Of the duet, the first four pages are simple and sweet; and nothing but its great length can prevent it from being a general favourite. Of course, the judgment and taste of the musicians can remedy this objection.

DRAMA.

DEURY LANE.

WE had intended to take a general survey of the characters in which Macready has this season appeared: since, however, he has neither fallen short of, nor exceeded, his former fame in any of those parts with the merits of which the public is sufficiently acquainted, we shall refrain from reverting to topics upon which sentence is already recorded. We relinquish this intention with the less regret, since Macready has put forth a new effort, and one that has confirmed the opinion of his abilities in the highest walks of the drama, which we have always entertained, and have not failed to express. Lord Byron has left *Werner* with but few, and those very equivocal, claims upon our sympathies. Amongst the strongest would be an affectionate and kind heart, did it not verge withal so closely upon weakness, that compassion too often runs the hazard of being lost in contempt. *Werner* also is sick and poor, and as such could not fail to awaken feelings of pity; yet even these, as the development is advancing, and their aid is most needed, leave him pitiless: he is raised from want to wealth, and from sickness becomes "as well as can be expected." He whines and whimpers till he filches the purse, and then whimpers and whines for having done so. No one can feel pity for the violent workings of his remorse, because they are inconsistent. Refined emotions are wholly incompatible with the very act of picking a pocket, and subsequent compunction is altogether an incongruity. It was probably under the consideration of the leading character being totally devoid of all title to sympathy, as well as the destitution of plot, that Lord Byron disclaimed the adaptation of *Werner* to the stage. In producing this play, then, Macready volunteered a task of no contemptible difficulty, which, nevertheless, he has ably and unexpectedly surmounted. As much judicious taste has been evinced in designing the requisite change in the closet, as talent in delineating, and fairly developing, that "ideal" by the force of representation on the stage. Without absolutely creating a new, Macready has elevated and remodelled *Werner*. He has invested the character with such claims to our sympathy as render it secure of our pity: without this, suffering and sorrow would pass by unheeded and unregretted, and all interest be negatived. In reading the tragedy, contempt is the prevailing feeling; in seeing *Werner*, acted as it is by Macready, contempt yields to compassion, weakness wears the garb of misfortune, the meanness of guilt is shrouded in the magnitude of sorrow, the improbability of remorse

is at once dispelled by the reality with which it is invested by the actor, and the act itself is forgotten in the sincerity of its repentance. Thus, by the powers of the tragedian, is a character, despicable from irresolution and meanness, raised to a share in the charities of our nature, the characteristics of tragedy preserved, and its object no longer unattained. We freely confess, we know no higher meed of praise to award, than that to which complete success in such efforts justly lays claim. Indeed, the whole style of Macready's acting, the result, we should presume, of deep study as well as of signal abilities, is chaste and energetic; it is alike calculated to call forth the plaudits of the many, and challenge the more scrutinising, and thence the more approving, gaze of critical refinement. We may not omit referring to a few defects, of which we conceive there would need but little attention to become divested. Among the most prominent of these, and it is one that has not failed to be frequently pointed out, is a too rapid transition of voice. While the highest pitch of declamation is still vibrating on the ear, the loud tone abruptly stops, and falls precipitately into the deepest colloquial whisper. This is unnatural in itself, creative of discordancy, and painful in its effect. We would deprecate its continuance, as the excess to which varying the voice is liable on the one hand, is almost as censurable as monotony on the other. This latter, however, is a fault to which Macready never is subject; occasional harshness is a charge from which he cannot be said to be equally free. We would instance the scene in *Werner* where the father acknowledges and palliates the theft: the amalgamation of sound in which these tortuous feelings are expressed, we cannot but condemn. We conceive, that passion however powerful, and feelings though mixed in their nature, may be portrayed forcibly, without involving discordancy. Nice discrimination between force and its failing, harshness, is an accomplishment as indispensable to an actor, as it is invaluable. Macready must remember, that the more elevated is the walk of the tragedian, the more conspicuous become his blemishes. These in others may pass unnoticed—in him they cannot. We shall, therefore, for the future, take especial care to find fault with him whenever we see occasion; for his genius is too high not to exact the critic's closest scrutiny.

Macready has added a masterly performance of *Henri Quatre* to his preceding parts; and is about to enact his inimitable *Rob Roy*.

COVENT GARDEN.

ON Wednesday night the tragedy of *Fazio* was revived, and Miss Kemble made her first appearance as *Bianca*. We consider it one of her happiest efforts—and so the audience also seemed to think; for the play went off, as the play-bills since have politely informed the public, "with tremendous success." Miss Kemble's conception of the character was excellent, and much of her execution very exquisite; and, suiting her age and figure, she also looked it well. The quiet affection of the happy wife, with one touch of imaginative jealousy of *Fazio's* first love—as if she grudged her a place even in his memory—was good in the first scene; and the after-one, where jealousy bursts forth into passionate upbraiding, and then softens into the tenderest and most confiding affection, was full of the poetry of feeling. The absent and depressed air with which she ascended the steps, quite unconscious of her own movements, was equally touching and natural. Where she is gradually excited to

her fatal resolve, when she finally denounces him, was a fine representation of passion wrought upon to madness; but when she hears the sentence of death, the burst of vituperation at the judges was out of keeping; such an announcement would be overwhelming at first: the speech put by the author into her mouth is in bad taste; and Miss Kemble gave it rather the tone of shrewish reproach, than passionate intercession:—she is more angry than earnest. Her interview with her husband, however, when she kneels at his feet in the agony of "the late remorse of love," might well justify the predictions of her warmest admirers. The scene where she implores even *Aldabella's* intercession is so unnatural in the play itself, that her utmost efforts could not redeem it. The parting with *Fazio* before his execution was terribly beautiful. The statue-like rigidity with which she stood, insensible to his departure, till the unusual sound of the bell tolling startled her into life—the despairing shriek with which she rushed from the stage—were as fine as truth and nature could make such a delineation. We again repeat, *Bianca* is one of Miss Kemble's happiest, and certainly one of her most original, conceptions. We never heard her voice so little monotonous—a few of the speeches reminded us somewhat of that low tone which was in Keats so irresistibly touching. Where she asks—

"Was her smile more sweet than mine, Inconstant *Fazio*?" the mere sounds were full of pathos and music. We have said nothing of the fifth act—for truly it was an act of supererogation. Opinion, when once matter of habit, is absolute monarchy; and a fifth act is, we suppose, as indispensable as white muslin to the misery of the heroine. But nothing could be more absurd than after *Fazio's* being led to execution: the scene changed to four young ladies dancing—to be sure, they shewed as much sympathy as they could—"Love's ritornella," arranged as a waltz, and played in a low key, while the dancers moved to the slowest possible time. *Bianca* rushes in, gets *Aldabella* sent to a convent, and dies;—this last scene destroying as much as possible the effect of its predecessors. Miss Kemble's performance is all that deserves criticism. Mrs. Chatterley, as "the haughty *Aldabella*," caricatured her character, and looked as insignificant as white feathers can make an individual whose head seems to wonder what is on it. *Ward's Giraffo Fazio* was an utter failure. Without mind to conceive, or power to execute, he is miserably out of place in such a character: we scarcely recognise one who is a clever and pleasant actor in his own line. We feel tempted to exclaim with Sir Ezzelin, "'Tis he—what doth he now? what brought him here?" We prefer him infinitely as a *Ward* in chancery.* *Fazio* requires a first-rate actor. It is singular how little indulgent human weakness is to itself in theory. Nothing is so common in real life as an individual whose wickedness is the result of his weakness—who first yields to temptation, and then regrets; equally ready with his crime and his contrition. It requires a good actor to invest such a character with interest and dignity. But the spirit of monopoly (a spirit peculiarly behind the age) runs through every ramification of the drama; the theatrical favourite will bear no rival near the scene; and one character well supported is reckoned enough. Vanity is proverbially short-sighted in its reasoning. Want of support is destruc-

* His performance in the *Chancery Suit* deserves praise, as equally lively and spirited. It is within his range.

tive of theatric illusion; and the carelessness, except when the principal is on the scene, is far more injurious to the love of the drama, than the success of any rival can be to the other. Our predecessors were more judicious: when Mrs. Siddons performed, Kemble and Palmer sustained the interest throughout. They felt the great dramatic truth, that the success of one on the stage is shared by his coadjutors. Indifference is a worse foe than competition; the one only shares the fruit, the other cuts down the tree. To take one instance from many of how little the drama has kept pace with the times:—some coarse epithets are put into Bianca's mouth which would be tolerated no where now, as coming from the lips of a young female; and of all instances of bad taste, to offend that of the age in which we live is the worst. The old dramatists are not the models for the present day.

We ought not to conclude this critique without animadverting on the intolerable misconduct of a few knots of persons in the theatre, who marred the whole effect of the performance by their continual and obstreperous applause. These parties should be told, that it is no part of their business to interrupt every speech of a favourite actor or actress by shouting and clapping their hands as if in ecstasies; and farther, that if they will not let the audience hear the points, or mark the merits of the performer, they must not expect the public to go along with them in their ultra-vehement, and no doubt well-grounded admiration. We must also notice the egregious folly of bawling for Mr. Kemble to give out the play for repetition. The colloquy between Mr. Egerton and a gentleman in the pit, was farcical in the extreme. Egerton was protesting that he did not know if Mr. K. was in the house; when the pit of keener sight, or more knowledge, bawled out, "Yes, he is yonder, in a private box." So the unfortunate gentleman was forced to march out in *dishabille*, to oblige his "kind friends."

OLYMPIC THEATRE.

Fra Diavolo (originally brought out at the Tottenham Theatre), was produced here with success on Thursday night. It only wants, we think, compression, and a few trifling alterations, to make it what such a theatre requires, a stirring and spirited piece. Mr. Hodges, from the Royal Academy of Music, sang most sweetly; but as yet wants confidence as an actor. When he sings, too, he ought to come forward towards the front; much of his melody was lost from the position he took, far back on the stage. Mrs. Glover and Vestris were excellent; and the whole of the bandit scenes very well dressed and acted. The other entertainments were *Clarissa Harlowe*, in which Mrs. Glover was again capital, and Miss Fitzwalter arch and pretty; and *Pandora*, which went off with great *éclat*. It is admirably suited to this place, in all its circumstances, and very clever and pleasing in itself.

FRENCH THEATRE.

We plead guilty of neglect; but cannot augment our fault by attempting a criticism upon mere report.

VARIETIES.

The Northern Bee.—Our readers will have frequently observed the mention of this periodical as a source of Russian intelligence. It is published at Moscow, under the title of *Sewernaja Pschtschela*; and its leading articles are devoted to politics, with which it occa-

sionally blends literary information and short criticisms of new publications.

Napoleon.—Haydon has nearly finished a portrait of Buonaparte, of the life size, for Sir Robert Peel. It is in the attitude, &c. of the engraving, of the effect of which we spoke so highly.

Madame de Genlis.—This celebrated writer died at Paris on the 24th of December, at a very advanced age. If we can find room, we shall insert a brief sketch of her singular career.

The French Clergy.—It appears by a statement recently published in the *Gazette des Cultes*, that the donations and legacies in favour of the French clergy amounted in 1829 to 4,268,927 francs. The total sum for the first half-year was 10,440*fr.*; and for the second, the period during which M. de Polignac was at the head of the ministry, 4,172,750*fr.* During the four preceding years, 20,750,984*fr.* had been received for the same object:—so that the clergy have obtained in donations, &c. independent of what is allotted them by the state, more than 25,000,000*fr.* The ministers of the Protestant church received in donations during the last year, 55,491*fr.*; the hospitals, 2,633,578*fr.*; the parishes, 585,639*fr.*; the department of public instruction, 105,580*fr.*; and the *Monts-de-Piété*, 2,000*fr.* The department of the Seine contributed to the above sums, during 1829, viz. for the clergy 29,631*fr.*; for hospitals, 201,857*fr.*; and for the parishes 21,000*fr.* Recently it has been resolved to allow stipends to the Jewish teachers, the same as to Catholics or Protestants.

Gold Mines in the Ural Mountains, &c.—The produce of the Ural mines amounted, in 1827, to 651,420*l.*; 1828, to 672,416. Gold is also found in the Rhine, but the quantity is so scanty, that the washer considers it a good day's work if he succeed in extracting to the value of five to six shillings. From the official accounts of the yearly produce obtained from that stream in the grand duchy of Baden, we observe that the value was, in 1821-22, 603*l.*; 1826-27, 808*l.*; 1827-28, 943*l.* The last produce, small as it may appear, for it scarcely exceeded seventeen pounds in weight, shewed so considerable an increase upon preceding years, that a great impulse was given to this branch of industry in Baden, and the harvest has become still more productive.

Lightning Tubes.—In the neighbourhood of the old castle of Remstein, near Bleuenburg, which stands on the top of a picturesque series of rocks, belonging to the greensand or quadersandsteen formation in a seindland, there have been found this summer very firm and long vitreous tubes (*Bleitzrohen* in Germany). From a trunk in the upper part, two branches go off, some of which are ten feet long, and from these proceed three little branches.

Roman Origin.—M. Jækel, one of the professors at the Gymnasium of Friedrichswerder, at Berlin, has published a treatise, for the purpose of shewing that the Latin language and the Roman people were of German origin.

Russian Sugar.—In October, 1829, there was established a company at Toulou; and in June, 1830, another at Romena, for the cultivation of beet-root, and the manufacture of sugar.

Georgian Literature.—In June last there was established at Tiflis a reading library, which is also the first bookseller's shop that was ever opened in that town. Two journals are at present regularly published in Tiflis, one in the Russian language, twice a-week; the other in the Persian language, weekly.

Russian Commerce.—It appears, from official returns, that in the years 1827, 1828, and 1829, the total value of the importations into Russia was 633,600,000 rubles; that of the exportations, 647,000,000; and that the commercial shipping engaged in trade amounted to 24,987 vessels, of which 2,145 sailed under Russian colours.

New Parisian College.—It is in contemplation to found a college at Paris, on a large scale, for the purpose of instructing youth, from the different independent states of South America, in all the various branches of human knowledge. It would seem as if some political object mingled with the motives of the friends of this project.

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. 111, Jan. 15.]

The Chameleon, a Scrap-Book or Album of Original Pieces, by a Gentleman of the West of Scotland.—A Grammar of the Hebrew Language, by Moses Stewart.—Memoirs of Rob Roy, and the state of Claniship in Scotland, abridged from the work of Dr. M'Lay, but with additional matter.—An English Grammar, by Mr. Connel.—The Rose, a Collection of the best English Songs.—Travels in the Holy Land, by William Rae Wilson, Esq.

METEOROLOGICAL JOURNAL, 1831.

	January.	Thermometer.	Barometer.
Thursday	6	From 28. to 38.	30.10 to 30.30
Friday	7	21. — 34.	30.46 — 30.49
Saturday	8	16. — 33.	30.50 — 30.58
Sunday	9	18. — 45.	30.22 — 30.00
Monday	10	24. — 41.	29.86 — 29.84
Tuesday	11	29. — 35.	30.00 — 30.02
Wednesday	12	27. — 39.	30.00 Stationary

Wind variable, N.E. prevailing. The 9th, 10th, and 12th, cloudy, with a little rain; the remaining four days generally clear.

Aurora Borealis.—On the evening of Friday, the 7th instant, the aurora borealis was again very amusing; the beauty of the scene received additional interest from the circumstance of its being tinged with a colour varying from an intense red to a copper hue.

CHARLES H. ADAMS.

Latitude..... 51° 37' 33" N.
Longitude..... 0 3 51" W. of Greenwich.

To the Editor, &c.

Sir,—A very magnificent aurora borealis occurred last night. I continued to observe it from ten o'clock until eleven. During the whole of that period the heavens were cloudless, and the stars in the southern half of the sky shone brightly. At ten o'clock a white nebula appeared, producing an illumination equal to that of a thinly-clouded full moon, was spread over the northern region, from the N.E. to the W. At half-past ten this white light assumed the form of innumerable long streaks, based on an irregular line, whose mean height was about 30° above the horizon. The direction of the streaks was vertical, and many of them reached to the zenith. A beautiful red light, but formless, then mingled in several places with the brilliant white—thus presenting an appearance truly sublime. The variations in the form and in the intensity of the lights were continual, but not sufficiently rapid to be distinguishable by the mere sight. The air at the time was still, and the ground covered with a hoar frost.—I am, sir, &c.

Retruth, January 8th, 1831.

TO CORRESPONDENTS.

We cannot find room for the exercise of Cantab in turning Milton into Latin verse. We are sorry to be obliged to postpone the conclusion of the Review of the Companions of Columbus; also the Biography of Dr. Currie.

Printed for C. J., G., and F. Rivington, St. Paul's Churchyard,
and Waterloo Place, Pall Mall.

MAUND'S BOTANIC GARDEN,
Vol. III. Part VI. and No. 73.

Comment on the execution, the cheapness, or the utility, of this
little favourite of the public, would now be superfluous. It may
suffice to state the simple fact, known to almost every Bookseller
in Great Britain, that during the last two years the utmost exertions
have been insufficient to produce a supply of the Work equal
to the demand of the Public. This has arisen from a
scarcity of the superior talent required in the colouring depart-
ment of its Plates. Skill and ability have, however, been bred
on its requirements; and it is hoped that the extended scale of
execution on which it is now constructed, will obviate further
disappointment to those who may be desirous of possessing early
Numbers of the Work.

Seventy-two Numbers, forming Six Parts, or Three Volumes,
are complete, any of which may be had, price, Numbers, fine,
1s. 6d.; common, 1s.—Parts, 10s.; common, 12s.—Volumes,
11. 17s.; common, 11. 5s.
Each Volume contains Ninety-six beautifully coloured Figures
of the most suitable hard Flowering Plants for ornamenting the
Garden or Pleasure Ground; together with every sort of in-
formation connected therewith, that may be considered either
useful in cultivation, or pleasing to the general reader.
Simpkin and Marshall; and Sherwood and Co.

In 8vo. price 2s. 6d. boards,
THE BENEFIT and NECESSITY of the
CHRISTIAN SACRAMENTS, and the Perpetual
Obligation of the Moral Law, particularly as binding us to keep
the Christian Sabbath; considered in Four Sermons preached
before the University of Oxford: with an Appendix, illustrating
the last of these Subjects, in Remarks on Dr. Heylyn's "History
of the Sabbath."

By **WILLIAM JAMES, M.A.**
Vicar of Cobham, Surrey, and Fellow of Oriel College.
London: Printed for C. J., G., and F. Rivington, St. Paul's
Churchyard, and Waterloo Place, Pall Mall; and J. Parker,
Oxford.

Under the Patronage of the King.
Imperial 8vo. 3s.; ditto, India Proof, 5s.; royal 4to. India
Proofs, 7s. 6d., from Paintings by Sir Thomas Lawrence, Sir
M. A. Shee, Sir W. Beechey, Jackson, Phillips, Hoppner, Cor-
tley, Howard, Owen, Hayter, &c.

finest original Paintings in the possession of His Majesty, the
Nobility, Gentry, and Public Bodies; and engraved in the most
finished style.

"The Nineteenth Number of this valuable and interesting
publication contains Portraits of Viscount Goderich, Professor
Person, and the Hon. Agar Ellis. The work is, we believe, com-
pletely established in public favour, and we know of none that
better deserves it."—*New Monthly Review*, Dec. 1829.

No. XX. contains Duke of Kent, Earl of
Harewood, Archbishop Narcs.

No. XXI. contains Marquess of Anglesey,
from the original of Sir T. Lawrence; the Earl of Carlisle,
from the original of Jackson; and Captain Sir John Franklin, from
Dorby.

No. XXII. will contain a Portrait and Memoir
of the late Right Honourable W. Huskisson, from the original,
painted for John Gladstone, Esq. of Liverpool, by John
Graham, Esq. of Edinburgh, three months previous to Mr. Hus-
kisson's lamented death.

Portraits, on large paper, for framing, or the Porte-feuille,
* * * Persons wishing to subscribe for the Work can commence
with No. I.; or have the whole hitherto published delivered at
once, as most agreeable.
London: Fisher, Son, and So.; Colnaghi and Co.; Moon,
Boys, and Graves; and M. Colnaghi.

In 8vo. price 2s. 6d.
BRIEF REMARKS on the DISPOSITION
towards CHRISTIANITY generated by PREVAIL-
ING OPINIONS and PURSUITS: being the Christian Advo-
cate's Publication for the Year 1830.

By **HUGH JAMES ROSE, B.D.**
Christian Advocate in the University of Cambridge.
Printed for C. J., G., and F. Rivington, St. Paul's Church-
yard, and Waterloo Place, Pall Mall; and J. and J. Deighton,
Cambridge.

Of whom may be had, by the same Author,

1. Christianity always Progressive: being
the Christian Advocate's Publication for the Year 1829. 8vo. 8s. 6d.

2. Short Greek Exercises, on an Improved
Plan; containing the most useful Rules in Syntax: being a
concise Introduction to the Writing of Greek. By the Rev. J.
Pleasant.

In 8vo. price 12s.
3. Greek Grammar, for the Use of Schools.
Translated from the German of V. Christian Fred. Roos. To
which is added, an Appendix on Greek Verification.
This Grammar is distinguished by lucid arrangement, concis-
ness, and fulness. The other judiciously commences with
precepts, and then proceeds to etymology and syntax. The system
of accentuation, which is so slightly noticed in Matthiae, he ex-
plains with the utmost clearness."—*Monthly Magazine*.

In 8vo. price 10s. 6d.
4. Epigrammata e Purioribus Græcæ An-
thologie Fontibus haurit. Annotationes Jacobelli, De Boech, et
aliorum instructi: sua subinde Notulas et Tabulam Scripturam
Chronologicam adjungit Joannes Edwards, A.M.

In 8vo. price 8s. 6d. boards,
5. Æschylus Prometheus Vincitur. To which
is subjoined, a Greek Ode, a literal Prose Translation, and
Notes, which contain the derivation of the more abstruse Greek
Words, and explanations of the difficulties of Metre, Grammar,
&c. Opposite each verse of the Chorus is placed the name of the
System to which it belongs; and the Ellipses of the Greek Text
are supplied in the Ode.
Printed for Whittaker, Treacher, and Co. Ave Maria Lane.

In 12mo. price 8s.
THE TRUE NATURE of CHRIST'S PERSON and ATONEMENT stated, in Reply to the Unscriptural Views of the Rev. Edward Irving "On the Human Nature of Christ."
 By WILLIAM URWICK.
 Dublin: Printed for W. Curry, Jun. and Co. 1. and Hurst, Chance, and Co. London.

In 8vo. price 12s.
A TREATISE on NAVAL TIMBER, MARINE, and ARBORICULTURE. To which are added, Critical Notes on Authors who have recently treated the subject of Planting, and the Culture of the Vine, Peach, Pear, Apple, &c. &c. by Sir Walter Scott, Sir Henry Stuart, and the Author of the Encyclopedia of Gardening; thus presenting a concise View of what is known of the Science and Practice of Arboriculture at the present day.
 By PATRICK MATTHEW.

In this volume directions are given for the Pruning and Training of Naval Timber, and for the Treatment of Forest Trees, from the gathering of the seed till maturity, including the proper location, and the different modes of Planting and Sowing, regulated by circumstances; the Influence of improper Treatment of the Seed and young Plant, the principle of the natural location of Vegetables, and the subject of Species and Variety are considered—the qualities and adaptation of Naval Timber, especially of Larch, are described—the imperfect acquaintance of recent Authors with these Subjects freely exposed—and the prospects and true policy of Britain, as the first naval power, pointed out.
 London: Printed for Longman, Rees, Orme, Brown, and Green; and Adam Black, Edinburgh.

1st January, 1831.
 Sir Walter Scott's Notice.

 * This re-issue has been adopted for the convenience of the public, who wish to possess the Work from the beginning, and in monthly volumes.
 Robert Cadell, Edinburgh; Whittaker and Co. London.

Who have also published this day,
Volume XX. of the present issue, which begins the "Abbas," with an Introduction by the Author, and illustrated by A. E. Chalon and Edwin Landseer.

The 6th edition, 4s. 6d.
EVIDENCE of the TRUTH of the CHRISTIAN RELIGION; derived from the literal Fulfillment of Prophecy; as illustrated by the History of the Jews, and by the Discoveries of recent Travellers.
 By the Rev. ALEXANDER KEITH, Minister of St. Cyrus, Kirkcaldyshire.
 Printed for Wagh and Innes, Edinburgh; and Whittaker, Treacher, and Co. Ave Maria Lane, London.

Established School Books.
 In 1 thick vol. 8vo. price 18s. bound, the 2d edition of
A GAZETTEER of the most REMARKABLE PLACES in the WORLD; with brief Notices of the principal Historical Events, and of the most celebrated Persons connected with them; to which are annexed References to Books of History, Voyages, Travels, &c.; intended to promote the Improvement of Youth in Geography, History, and Biography.
 By THOMAS BOURN.
 Teacher of Writing and Geography, Hackney.
 "We think that Mr. Bourn's particular object in forming it, and the great labour and reading which must have been made subservient to it, deserve the success which it has experienced, and the good opinion which we now readily pronounce on it."
Monthly Review.
 "For general reference it is superior to any of the same size, and as a school book has no competitor."
New Monthly Magazine.
 "Mr. Bourn's plan is a very good one, and very pleasantly executed."
Literary Gazette.
 London: Sold by Samuel Leigh, 18, Strand; J. Harris; Harvey and Darton; and Simpkin and Marshall.

Of whom also may be had the following Works of the late Mr. Wm. Bate, edited by T. Bourn.

Exercises on the Globes and Maps, interspersed with some Historical, Biographical, Chronological, Mythological, and Miscellaneous Information; on a new Plan. To which are added, Questions for Examination, and an Appendix, by which the Constellations may be easily known. 11th edition, 12mo. 5s. 6d. bound.

Chronological, Biographical, Historical, and Miscellaneous Exercises, on a new Plan, designed for Daily Use. 10th edition. 12mo. 7s. 6d. bound.

Arithmetical Questions, on a new Plan; intended to answer the double purpose of Arithmetical Instruction, and Miscellaneous Information; designed for the Use of Young Ladies. 10th edition. 12mo. 6s. bound.

Geographical Exercises on the New Testament; describing the Principal Places in Judea, and those visited by St. Paul; and containing the most important Occurrences recorded in the Evangelical Histories. With Maps, and a brief Account of the principal Religious Sects of Mankind. 4th edition. 12mo. 5s. 6d. bound.

Miscellaneous Questions, relating principally to English History and Biography. 2d edition. 12mo. 4s. bound.

Arithmetical Tables. 15th edition. 8d. bound.

* This Work contains, in addition to the usual Tables of Weights and Measures, and Account of the Coinage and Population of the United Kingdom—Statistics of the Jewish People—Jewish, Roman, and Grecian Coins and Medals—Tables of Kings and Queens since the Conquest—Birthdays of the Royal Family—Sovereigns of Europe, with the time of their Reign and Accession—Explanation of Astronomical Signs—Length of Cities in different Countries—Population of the World—List of Stamps for Receipts, &c.—Table of Hackney-Coach Fares—Tables to calculate Wages—Perpetual Almanac, &c.

Also, just published, price 1s.
Biographical Copies, with References to Men's Gazetteer and Butler's Works. By Thomas Bourn.

MOORE'S LIFE of BYRON, complete in 8 vols. 4to. with beautiful Portrait.

2. **The Life and Correspondence of Admiral Rodney.** Edited by his Son-in-law, Major General Mundy. With a Portrait, 8 vols. 8vo. 2s. Dedicated, by permission, to his Majesty.

"To the lover of history, to the nautical student, to the statesman, and to the tactician, this work will be equally valuable. The correspondence is most interesting. It brings before us many national events and celebrated characters, with all the distinctness of a yesterday's narrative. These volumes have afforded us many a pleasant hour, and the hero of them, who was also that of a most animated society, by his present Majesty, deserves to be better known."—*Sunday Times.*

3. **Adventures of Giovanni Finati,** in various Countries of the East. Edited by William John Bankes, Esq. 8 vols. foolscap 8vo. 14s.

"It is long since we have met with so eventful and interesting a narrative."—*Literary Gazette.*

4. **On the Progress of Society.** By Dr. Hamilton, of Aberdeen, Author of "An Essay on the National Debt." Crown 8vo. 10s. 6d.

5. **Causes of the Failure of the Military at Paris.** By an Officer of the French Guards. 2d edition. 8vo. 3s. 6d.

"An accurate and remarkably candid relation of those events."
 "Decidedly the most interesting document that has hitherto been published, upon those celebrated Three Days which overturned a throne, and changed a dynasty. It ought to form part of the library of every one who wishes to know and preserve the history of the time in which he lives."—*Blackwood's Magazine*, January, 1831.

6. **A German Grammar, on a New Principle,** calculated to facilitate the acquirement of the Language by the English Student. By Dr. Becker. 8vo. 8s. 6d.

7. **Three Lectures on Wages, and on the Effects of Absenteeism, Machinery, and War;** with a Preface on the Causes and Remedies of the Present Disturbances; delivered before the University of Oxford in Easter Term 1830. By Nassau W. Senior, Magd. Coll. A.M. late Professor of Political Economy. 2d edition. 8vo. 3s. 6d.

8. **Family Library, No. XVIII. The Voyages and Adventures of the Companions of Columbus.** By the Author of the "Sketch Book."
 John Murray, Albemarle Street.

In 1 large and elegant vol. 8vo. price 10s. 6d. canvas boards,
THE MESSIAH; or, the Redemption of Man. A Poem, in 18 Books, with Explanatory Notes.
 By E. STRANGWAYS.

* This Work contains truth without fiction. It commences with the Creation, and concludes with the Day of Judgment; embracing, in its progress over the course of time, every topic given by the pen of Inspiration respecting the above important subject.

London: Printed for Baldwin and Cradock; and Longman, Rees, Orme, Brown, and Green, Paternoster Row; M. Bell, Richmond, Yorkshire; and all other Booksellers.

Literary Presents.

FAMILY LIBRARY.
 "Books that you may carry to the fire, and hold ready in your hand, are the most useful, after all. A man will often look at them, and be tempted to go on, when he would have been frightened at books of a larger size and of a more erudite appearance."—*Dr. Johnson.*

"Mr. Murray's Library.... A very excellent, and always entertaining Miscellany."—*Edinburgh Review*, No. 108.

"La collection que fait paraître M. Murray, sous le titre de Bibliothèque de Famille, devient de jour en jour plus populaire, et justifie pleinement son succès par le choix des sujets, les noms des auteurs, et la foule de documents curieux, de faits ignorés, de remarques neuves, que rassemblent les volumes déjà publiés."—*Revue Encyclopédique.*
 "Eine vortheilhafte sammlung von Volksbüchern."—*Morgenblatt.*

Volumes of the Family Library published up to this time.

Price 5s. each, profusely illustrated, and neatly bound in canvas.

No. XIV. **Lives of Eminent British Physicians.** With Portraits and Woodcuts.

No. XV. **The History of British India.** Vol. I. By the Rev. G. K. Ogle, F.R.S. With a Map and Six Engravings on Steel.

No. XVI. **Letters on Demonology and Witchcraft.** by Sir Walter Scott, Bart.

No. XVII. **Life of Bruce the African Traveller.** By Major F. B. Head, Author of "Rough Notes taken during some rapid Journeys across the Pampas and among the Andes."

Family Dramatists, Nos. I. and II., being the Works of Philip Massinger, illustrated with Explanatory Notes; and adapted for Family reading, by the omission of exceptional passages. 8s. each.

John Murray, Albemarle Street.

In 1 vol. 18mo. with a finely engraved Frontispiece, price 8s. boards.

A MANUAL of RELIGIOUS INSTRUCTION for the YOUNG; containing the Sacred History of the Old and New Testament Dispensation—an accurate Statement of the Doctrines of the Gospel, in Two Parts—a brief Outline of the Evidences of the Christian Religion; together with an Address to the Young.

By the Rev. ROBERT RIMSON, M.A.
 Colebrook House, Ilington.
 Printed for James Duncan, 87, Paternoster Row.

2d edition, in 1 vol. 8vo. price 14s.
MILITARY MEMOIRS of FOUR BROTHERS (Natives of Staffordshire) engaged in the Service of their Country, as well in the New World and Africa as on the Continent of Europe.
 By the SURVIVOR.

In 1 handsome 8vo. vol. price 10s. 6d. a new edition,
 2. **The Encyclopedia of Anecdotes, illustrative of Character and Events.** From Genuine Sources. By George Ramsay.

In 1 vol. post 8vo. with 81 appropriate Etchings, price 8s. 8d. edition.

3. **The Posthumous Papers of a Person lately about Town.**

"Some of these Papers are of decided excellence, and one of them is a most powerful, pathetic, and beautiful—without a rival, we should almost say, in any tale of equal length that we can call to recollection."—*Athenaeum.*

W. Sams, Bookseller to his Majesty, St. James's Street.

Elegant Christmas Present.
 In 1 vol. post 8vo. price 10s. cloth boards, and 11s. 6d. half bound, morocco.

THE CABINET ALBUM; a Collection of Original and Selected Literature.

"A close and beautifully printed volume of specimens of the flowing literature of the day. The choice bespeaks a cultivated judgment; and there is such an excellent variety, that we confidently recommend the volume to the lovers of light and pleasant writing. The most fastidious reader will be pleased with much that the Cabinet Album presents, and will agree with us in encouraging all attempts at snatching from doom the accidental excellences that our glutted markets exhibit."—*Atlas.*
 London: Hurst, Chance, and Co. 48, St. Paul's Churchyard

Just published, by Edinburg Wilson, 98, Royal Exchange,
 In 1 vol. 12mo. price 4s. 6d. boards.

THE FOREIGNER'S ENGLISH CONJUGATOR.

By JUSTIN BRENNAN.

No fewer than seven different languages, exclusive of English, are here put in requisition, to illustrate our Conjugators—but most particularly *shall* and *will*, with their derivatives, *should* and *would*, which have hitherto proved such stumbling-blocks to the Foreigner. It is presumed that this Work will much encourage strangers to learn our language, as its chief difficulties are explained in that clear and familiar manner for which the Author is so distinguished.

Also, by the same Author, 3d edition, price 4s.

Composition and Punctuation familiarly Explained, for those who have neglected the study of Grammar.

This popular Work is now re-produced, with very important additions. Not only is every article revised with great attention, but so much has been added, that the present edition may be considered as almost a new work.

"This is a plain, useful, sensible, little treatise; does its author credit; will well repay attention; and has our strong recommendation."—*Literary Gazette.*

Also, price 2s.

Utility of Latin Discussed, for the consideration of Parents, or those who have influence in the direction of Juvenile Education.

In this little Treatise the important subject of classical utility is placed in an original and highly interesting point of view, and entirely free from the prejudices that are usually brought in aid of such discussions.

"We are happy in having another opportunity of complimenting the author of 'Composition and Punctuation,' on a work which, unlike many of the present day, contains *utramque in parvo*, in which, in short, good sense and practical utility are in an immensity ratio to its size and pages."—*Edinburgh Literary Journal.*

No. XIII. 4s. 6d. of the

FAMILY CLASSICAL LIBRARY; or,

English Translations of the most valuable Greek and Latin Classics; with Biographical Sketches, Notes, Portraits, Maps, &c. 4s. 6d. each Number, small 8vo. published monthly.

Edited, printed, and published by A. J. Valpy, M.A. and sold by all Booksellers.

"If you desire your son, though a great scholar, to read and reflect, it is your duty to place into his hands the best translations of the best classical authors."—*Dr. Parr.*

The selection will include those Authors which may be read by both Series of the Twelve Numbers already published contain: Demosthenes, Balaust, Xenophon, Herodotus, Virgil, Pindar, Anacreon, and Tacitus.

Nos. XVI. and XVII. will comprise Horace, in which will be introduced Translations of different parts of the Author from the pens of Dryden, Pope, Bentley, Swift, Porson, G. Wakefield, Prior, Milton, Denham, Roscommon, Cowley, and Byron; and of some of the most eminent Poets of the present day.

No. XVIII. will comprise Juvenal and Persius.

Any Author may be purchased separately, at a small advance in price.

"A knowledge of ancient literature has always been prized as a valuable acquisition by men who paid any attention to the cultivation of their minds; and by those who are unacquainted with the dead languages, the work now before us must be regarded as a treasure of great value."—*Gazetteer.*

"Among the various works at present published in a similar form and at similar intervals of time, Mr. Valpy's 'Family Classical Library' has, perhaps, the greatest claims on the public."—*Edinburgh Review.*

"The 'Family Classical Library' will greatly assist the classical labours of tutors as well as pupils."—*Christian Journal.*

"This work, as far as it has gone, is not surpassed in use, cheapness, and elegance, by any similar publication of the day."—*United Service Journal.*

In 18mo. with Engravings, &c. 6d. handsomely bound.
THE EXCITEMENT; or, a Book to
 Induce Young People to Read, for 1831; containing
 Remarkable Appearances in Nature, Signal Preservations, and
 such Incidents as are particularly fitted to arrest the Youthful
 Mind.
 Published by Whittaker, Treacher, and Co. Ave Maria Lane,
 London: and Waugh and Innes, Edinburgh.

Kennedy's Arrow and Rose.
 3d edition, in demy 8vo. price 6s. boards,
THE ARROW and the ROSE; with
 other Poems.

By WILLIAM KENNEDY,
 Author of "Riffling Fancies," "An Only Son," &c.
 "Critics, and critics only, can do full justice to the spirit, the
 deep feeling, the energy of this work. We consider Mr. Ken-
 nedy's love-poetry some of the finest that ever was written. He is
 a poet, if thought, feeling, and originality, can make one."—
Literary Gazette.

"He is full of strong feelings and good conceptions. Manliness
 and sincerity are the great characteristics of his style. He writes
 like a man of good muscle—he strikes his idea on the head at
 once, and then proceeds to another. He is no admirer of orna-
 ment—he uses the good old language of England—thrilling as it
 is, and full of home power; and his thoughts stand in it strong
 and sturdy, like the bristles on the back of the fretted porcupine."
Edinburgh Literary Journal.

"North. There, James, is an exceedingly graceful, elegant,
 and pathetic little poem, 'the Arrow and the Rose.'"—*Black-
 wood's Magazine.*

"The 'Arrow and the Rose' has amply justified our high
 opinion of his talents. The lesser poems of this beautiful volume
 are distinguished by uncommon merit."—*Athenaeum.*

"This delightful volume would do credit to the first poet of
 our age, and cannot fail to win for its deserving author the most
 of present praise and long-enduring fame."—*Chiltenham Journal.*

"A splendid effort of Mr. Kennedy's genius."—*Glasgow Courier.*
 "Mr. Kennedy is manifestly a poet of nature's workmanship.
 He effects the difficult achievement of blending majesty with
 simplicity of diction."—*Edinburgh Courier.*

"The 'Arrow and the Rose' is worthy of the author's previous
 reputation. The poem abounds with beautifully wrought pas-
 sages, as well as of real poetic grandeur."—*Belfast News Letter.*

"Whether he breathes aspirations of love, or chants a song of
 peril and of strife, he is sure to touch the affections or rouse the
 daring energies of the soul. His mind is essentially poetic, and
 he seldom fails in giving forth, with strength and spirit, his own
 bold and burning conceptions."—*Belfast Northern Whig.*

"Many versification, with a spice of humour and satire."—
Monthly Magazine.

"The expectations which his previous volume excited have
 been fully justified by the elegant publication now before us.
 The story of the first love of the renowned Henry of Navarre is
 told in the true minstrel manner."—*New Monthly Magazine.*

Smith, Elder, and Co. 55, Cornhill.

Popular Novels just published by Henry Colburn and
 Richard Bentley, New Burlington Street.

THE NATIONAL LIBRARY.

"Of all the periodical works undertaken by modern
 enterprise, the National Library is considered, either in reference
 to its extent, or to the character, or to the sterling merit of its li-
 brary contents, that which comes before the public with the
 strongest claims upon their support and patronage."—*The Bee.*

No. V. illustrated with Plates, price 6s.
Festivals, Games, and Amusements, Ancient
and Modern. By Horace Smith, Esq. Author of "Brambletye
 House," "Walter Colyton," &c.

"Until the publication of Mr. Horace Smith's 'Festivals,' in
 the National Library, the public have not been generally informed
 as to the festive recreations of all times and nations, from the
 grand religious holidays of the ancient Jews, the poetical games
 and celebrations of Greece and Rome, to the hearty and social
 pastimes of merry old England. No library, circulating or pri-
 vate, should be without this little volume, which best teaches us
 how to be merry and wise."—*Morning Chronicle.*

No. IV. with beautiful Plates, price 6s.

The History of Chivalry, and the Crusades.
 By G. P. R. James, Esq. Author of "De L'Orme," "Darnley,"
 &c.

"This is a charming volume."—*Atlas.*
 "One of the most valuable and important volumes which has
 yet been addressed to the interesting reproduction of the crusades
 and chivalry. Just, accurate, and animated, Mr. James has
 given a picture of the crusades as faithful as it is lively."—*Liter-
 ary Gazette.*

"This is, without exception, the most delightful little tome
 we ever encountered."—*The Bee.*

No. III. with Portrait of Dr. Black, price 6s.

The History of Chemistry. By Dr. Thom-
 son, Professor of Chemistry in the University of Glasgow.

"Compiled with judgment, and arranged with clearness and
 precision, this work deserves a farther interest from the enthusi-
 asm with which the author has treated his subject; while its
 popular style will ensure it a very extensive perusal."—*Literary*
Gazette.

No. II. illustrated with a Map, price 6s. 3d. edition,
The History of the Bible. By the Rev.
 G. R. Gleig.

"This is an able manual of Scripture history."—*Literary*
Gazette.

No. I. with a Portrait of Lord Byron and View of Newstead
 Abbey, &c. price 6s. 4th edition,
The Life of Lord Byron. By John Galt, Esq.

"The only complete biography of Byron we have ever seen."—
Courier.

"We know of few biographies superior to this."—*Sun.*
 "If this work be not popular, we pity the taste which has suf-
 fered itself to be misled from the due appreciation of works like
 that before us."—*Edinburgh Evening Post.*

"The only portable and readable life of Byron extant."—*Dur-
 ham Advertiser.*

"Mr. Galt's volume should invariably accompany the collected
 works of Lord Byron. It is the only complete record extant of
 the whole life of one of the most remarkable men of any age or
 country."—*Gentleman's Magazine.*

REVIEW OF NEW BOOKS.

The Temple of Melekartha. 3 vols. small 8vo. London, 1831. Holdsworth and Ball.

THIS is a very extraordinary work,—a production at once of wild and vivid imagination, and yet of much thought. It is a philosophical and political essay, embodied in a romance. The scene is laid in the early and unknown time of history, and is the chronicle of a nation which, under the command of a wise prince, throws off the bondage of another people, and emigrates to a rocky isle, where it attains a very high state of wealth, civilisation, and power. The fatal effects of superstition, pestilence, and warfare, are shewn in its history. Parts are fine; but the story is extravagant, and the end not very clear. But to review it as a romance would give a small idea of its contents: perhaps we shall do the author more justice by a collection of extracts.

Speaking of Tyre: "They forget also a humiliating circumstance of their present condition, namely, that, among themselves, by the natural and unchecked encroachments of power and cupidity upon weakness and necessity, the vast wealth of the community has clustered itself together into a comparatively small number of enormous masses, which oppress and obstruct the movements of the body politic more than enrich it, and which, while they corrupt the few, leave the many in a condition of desperate wretchedness, such as deprives them of every feeling of patriotism, and allows the only hope of relief to fix itself upon gloomy ideas of revolution and anarchy."

"It is a capital error to imagine that the prosperity of a mercantile community can securely rest on the exclusive possession of any secret in art. With or without secrets, wealth and national importance will infallibly belong to the possessors of intelligence, industry, good government, and natural advantages of produce and position. Nothing but internal treason can reduce a people, so favoured, to poverty and dependence."

"If the state be a machine," said the father of his people, "poverty is a rottenness in the works, that must bring slow or sudden disruption upon all the parts. If the state be a living body, then does the sympathy of disease pass inevitably from member to member. Neither law nor force can intercept the correspondence, which shall at length convey the miseries of the ruinous hut wherein want hides its woes, to the halls of wrongful luxury. Selfishness is a blind vice, and grasps unknowing at its own destruction. Vainly does it strive to sever itself and its circle of trim indulgences from the sinking wretchedness of its neighbour. As well might the right hand regard with indifference a poisoned wound inflicted on the left. See you a stranger whom the winds have cast upon our island; take heed that he falls not into your narrow our homes; his welfare is our own; and though no kindness were to throb in our hearts, yet a provident selfishness would interpose in his behalf; for his wretchedness is of a

highly contagious quality. How much more certainly and fatally contagious would be the indigence of thousands of our brethren, were we to suffer thousands of them to fall into helpless want! The most perfect social system is the one, not in which either the haughty pretensions of the rich, or the contumacious demands of the poor, take their freest course; but that, whatever its form of polity may be, wherein the law of universal sympathy exists in the fullest vigour."

"It is certain that no counsels of conduct are so apt or so efficacious as those which burst upon conscience, while one contemplates, in the mirror of history, faults, infirmities, and perversities, which at a glance the reader recognises to be specifically his own."

The different members of the Tsidonian councils are fine-sketched moral portraits: we select one as a specimen.

Speaking of the third chief: "His wisdom was not the intuitive sagacity which some men possess as perfectly in the early as in the last stage of life; but rather the ripened and accumulated fruit of long and large experience. So great and various had been his knowledge of human affairs, and so much was he addicted to reflection, that his anticipations of futurity were little less infallible than the announcements of Heaven. He spoke seldom in the senate; nor at any time descended upon the field of argument; nor ever added to the brief declaration of his advice, a single sentence that might serve to recommend it to the approval of others. It is hard to say whether he would not rather have witnessed the miscarriage of an enterprise, than patiently have demonstrated the false calculations of those whom he saw to be proceeding upon the hollow ground of fallacious hopes."

The ensuing, too, is a fine distinction.

"Habaddon had seemed always to be pressing on from the passing moment to the next: Tartak existed tranquilly in the present hour."

"Nothing often is more difficult than to effect inconsiderable changes in the usages of a people; nothing often more easy than to achieve surprising revolutions in their political condition. Mankind is pertinacious and adhesive in whatever is trivial; fickle and fond of change in whatever is momentous."

"A king is a man of business. Call men of business to your service; and with such on your right hand and on your left, administer the affairs of your empire solely on those common, intelligible, long-tryed, and indisputable principles which the good sense of the mass of mankind approves. Be not too impatient of things confessedly imperfect: old and familiar errors are less dangerous often than young truths. Revise, amend, corroborate; press towards the better; but be slow to renovate. Act more than meditate."

"Men of intellectual tastes, inflated by the vastness of political speculations, lose all recollection of common sense amid the pleasures of contrivance. They talk of man, and of his position in society, as lightly as if they were cal-

culating the movements of pawns on a chess-board; and persuade themselves that human beings are as manageable as figures of ivory."

"If the accommodations and the luxuries of the body be the ultimate and highest objects of human desire, then let philosophy pretend to no other place than that of the slave of art. If man finds his perfection when he is clad in attire of exquisite workmanship, sleeps beneath decorated roofs, is conveyed, as on the wings of the wind, over roads smooth as the pavement of a palace: if softness, and finery, and facility, confer all the bliss which man should think of, then let science humbly whisper in the ear of the artisan her improved methods—and do no more. But we spurn these notions, bred of commerce, and tending to render money the god of universal idolatry, as the bestower of whatever can be thought desirable. Find a country in which the mechanical and chemical sciences take the lead, explicitly because deemed the most useful, and you find a community wherein wealth, more than either wisdom or virtue, is held in honour,—a community in which both are a jest, unless attired in silks. Men of intelligence are marvellously blind to their interests as a body, when they tacitly favour this subserviency of philosophy to the hard-handed arts of life: yes, and forgetful also of the influence they might exert in behalf of the mass of the people. To fulfil their function as an organ in the body politic, men of learning must hold an absolute independence. But they have virtually recognised their own subordination when they allow it to be supposed that vulgar utility is the end of science. What is this utility, when embodied, but a somewhat which money may purchase? Utility, rendered into the language of facts, means, a splendid crimson cloak—a richly embodied tunic—a painted vase—a carved table—an inlaid couch—a fretted roof—a flying chariot. Thus philosophy is confessed as a menial in the train of opulence! In every civilised community we find, on the one hand, the mass of the people; and on the other, the ever-swelling and combined forces of government, and wealth, and hereditary rank, wrestling against each other; and the latter pressing with the constancy and insidiousness of physical agents, upon the rights of nature in the multitude; taxing and taxing, and taxing yet again, not the mere comforts, but the heart's blood of the many, and driving human life nearer and nearer upon the very verge of naked existence. What power then shall mediate between the few who are the possessors of this crushing force, and the many who are its victims? Say, if you will, a principle of beneficent self-denial in the hearts of the opulent and the noble. Alas! the beneficent few learn to whisper, 'If we decline to withdraw his cloak from the poor man's shoulders, another will rend it thence with less tenderness.' Will you defend the poor against the rich by political constitutions? That very spirit of liberty which belongs to such systems, breeds an atrocious and selfish pride, and indurates the heart. The security of life and property,

which are the boast of popular governments, only favours and accelerates the accumulation of wealth, and nerves the arm of oppression by the corroboration of law. Political freedom, while it sanctimoniously protects the poor man's life, laughs at his starvation. Do we not then, even for the people's sake, need a third power,—a power in its very element separate from wealth, and yet lifted above the rude influence of popular caprice? But a philosophy which is nothing more than an instructress of the mechanic arts, and which, therefore, receives its stipend from wealth, and cringes to it, can never so mediate. I am, you perceive, myself pleading for a philosophy not subservient to utility, on the ground of utility; but it is a utility of a higher sort; and affirm that the people need an intervening influence which, by its absolute independence, shall intimidate the brutal caprices of despotism, and abash the selfishness of opulence. A high and independent philosophy reserves an honour for mind, which neither rank nor money can snatch from its rightful claimants; and as nature scatters the rare endowments of intelligence equally upon cottages and palaces, the poor have a field open to them, when learning has a precinct on which to contend with the rich, where gold can purchase no advantage."

The following are one or two touches, full of the poetry of description.

"Shoals of brightly coloured fish flashed, from time to time, beneath us, like sheets of summer lightning.

"The sun, fore-run by no silvery dawn, burst rayless and lurid from the east; frowned through his course; was pale at noon, and went down sudden, without leaving a glory to declare at what point he had parted from the upper skies.

"The dawn of the next day opened murky. Mishapen clouds, dissolving into limbs and fragments, and again clustering in masses, hastened up from the east, and sped across the sky, like forerunners of evil hours.

"The plain, to which the eye discerned no limit, inclined sensibly towards the southern sun. Its surface was varied by gentle undulations, and broken by scattered masses of granite. A fine grass, of brilliant greenness, covered the soil, interspersed with a countless variety of small and sparkling flowers. Wild thyme, and other fragrant herbs, held also their districts here and there, and enriched the gales with their perfumes. But except around a single spot, where art had supplied the defect of nature, neither tree nor shrub graced the plain."

This is contrasted by a wood.

"The travellers entered a shade of lofty trees; and here first they noted the strange intermixture of the awful relics of an elder time with the young and living produce of later ages. Here and there, amid the flourishing trunks and crowded foliage of trees in their prime of youth and beauty, tending direct to heaven, were seen oaks of enormous bulk and altitude, reclining, riven, shattered, leafless, and utterly dead, protruding their vast and sapless limbs far through and among the modern verdure; or rearing their scathed heads above the level of foliage, affronted the summer sky with their wintry nakedness. The palm also of the desolated world, slanting athwart the modern stems, lifted its shorn head to heaven; and though itself a sear column, gave support to an abundance of flowery climbers—the gay produce of each spring; and thus brought into forcible contrast—yesterday and the remotest time!"

Our limits forbid further extract, at least this week; and we leave for the present, what we cannot but again designate as a most extraordinary work, blending conceptions of the wildest extravagance with the most acute intellect,—a romance, whose scenes are like rich phantasmagoria, yet with thoughts and opinions marked by immense information and profound reflection. It is a Utopia, whose idea and colours are best likened to one of Martin's most gorgeous and imaginative pictures. We have rarely been so much struck with a nameless production.

Sermons intended to shew a sober Application of Scriptural Principles to the Realities of Life: with a Preface addressed to the Clergy. By John Miller, M.A., late Fellow of Worcester College, Oxford. 8vo. pp. 475. Oxford, 1830, Parker; London, Rivingtons.

Orlando Innamorato di Boiardo, Orlando Furioso di Ariosto; with an Essay on the Romantic Narrative Poetry of the Italians: Memoirs and Notes. By Antonio Panizzi. Vol. III. 8vo. pp. 386. London, 1830. Pickering.

WE have thus introduced an English divine into the society of two Italian poets, neither for the purpose of hazarding the orthodoxy of the first, nor with the hope of effecting the regeneration of the latter; but solely in order to obviate the inconvenience of noticing a work in one part of our *Gazette*, while we wish to quote from it in another. In brief, and not the less earnest praise of Panizzi's very beautiful volume, we shall, saving our purpose of quotation from a note, dismiss the work without further comment or commendation. In reverting to the Sermons of Mr. Miller, we would preface our remarks by observing, that he is a man whose opinion on most subjects unquestionably on the subject of which he at present treats, carries with it a very deep influence with all that know who and what he is. This, however, is no more than the respect and homage which sound erudition and an enlarged mind invariably and justly elicits. In his opinion, too, we find that of many who "stand in the high places," and are therefore the more prominently involved in the interests of the subject he approaches.

Without entering into the question of church reform, we proceed to quote his observations. They are cautious and unobtrusive, as the words of the wise and modest ever are.

"Must there not, again, be many others, who, while they love and venerate the church of England, both as 'the pillar and ground of the truth,' and as the *only* ark (in this our own kingdom at least) of any thing like *proper* toleration or *just* religious liberty, yet cannot blind themselves to flaws and weaknesses, which may be here and there detected in its aggregate condition, of which it were no less than folly to deny the existence? Must it not be grief to *these*, to mark the almost equally erroneous violence and pertinacity with which these frailties are respectively defended and assailed? *which imperfections they would wish, of all things, to have corrected and removed, but which it is made scarcely possible to touch, for any such good end, by reason of the fierce, ungenerous clamour round about the sanctuary, and the variety of enemies, all ready to rush in to build up their own visionary schemes, or schemes of selfishness, upon its ruins.*"

Before offering our brief remarks upon the above, we shall bring under the view of our readers a note from Panizzi's volume, no less interesting as containing a curious piece of

historical information, than what, in reference to Mr. Miller's preface, we conceive to be a case in point.

"It gave me great pleasure to find a copy of this most rare pamphlet" in the collection of the Right Hon. T. Grenville, who placed it in my hands, and allowed me to republish it. I determined upon making use of this liberal permission, since this little book is of the greatest rarity, and its contents are strictly connected with the life of Berni, and the history of his *Rifacimento* of the *Innamorato*. The copy in possession of Mr. Grenville was printed in 1554, and not 1555; it has neither name of printer, nor of the place where it was published; but it has all the appearance of having been printed at Basle. It consists of one single sheet, small 8vo, in italics, except the title-page. From its contents it will appear, first, that an authentic edition of the *Rifacimento* was suppressed by the Court of Rome, which was more afraid of books exposing its abuses than of immoral publications, as I myself observed, vol. ii. p. 138; secondly, that such low and vulgar lines as disfigure the introduction to the 20th canto in the *Rifacimento* are not by Berni, since they are not found in the stanzas published in this pamphlet; thirdly, that I was right in suspecting that great liberties have been taken with Berni's *Rifacimento*, since most of the stanzas contained in this little publication are not in the editions of the poem *rifatto*, by Berni, and the few which occur in the *Rifacimento* differ considerably from those which are inserted in that little tract; and fourthly, that *most of the greatest men attached to the court of Rome were inclined to the principles of the reformers*; and that Berni himself was a Protestant in his heart, at least in his latter days. Giberti, we know, introduced a very good discipline, and eradicated many abuses in his diocese of Verona; and he was the most intimate friend of the great poet M. A. Flaminio, who was undoubtedly attached to the Protestant creed. Cardinal Frederic Fregoso, also, has been considered favourable to the reform; and although the same has not been said of the others mentioned in these stanzas, there is nothing improbable in the fact. They were intimately connected with persons either favourable to the reformation, or who openly embraced it."

We shall now take the freedom of remarking, that Mr. Miller's observations on church reform, carry along with them an inference which is little else than an excuse for the continuance of the very abuses he deprecates and deplores. We would ask the plain lay question, Whether, where abuses (call them "imperfections" if you will) are acknowledged to exist, are they to go on and on, because of "the clamour round about the sanctuary?" What is it that calls forth this clamour, but the existence of these abuses? of which the admission ought surely to be followed up by the removal. Are the rotten parts of the sanctuary to moulder on, because "its enemies are ready to rush in?" Are its weaker parts,—which it is in the power of its rulers to make strong—to remain in their weakness, as breaches for the enemy to enter in by, and without which, it may be added, he would not venture to attack, or would do so without hope of success? At the time of the reformation, we perceive from the foregoing singular and important note, that many of those who "stood in the high places" of the Roman church heard the cry them, as now, not against religion itself, but against its abuses; and they, too, wished for the removal

• By Vengerio.

of "imperfections" (they ought to have felt the necessity), but they did not, "because of the clamour round about the sanctuary," *themselves repair it*; and so it was knocked about their ears.

The object at which Mr. Miller aims in his Sermons, and recommends to the clergy, is "the application of Scriptural principles to the realities of life." If discourses, with this professed object, have not been published, the example has been set, and by none more efficiently than by our metropolitan prelate. Mr. Miller has, we think, fully accomplished his purpose, and that in a forcible and unassuming style, alike adapted to the understanding of the highly educated, and to his less fortunate brother,—in a word, to all but those who have "eyes to see, yet see not."

Narrative of Discovery and Adventure in Africa, from the earliest Ages to the present Time, with Illustrations of the Geology, Mineralogy, and Zoology. By Professor Jameson, James Wilson, Esq. F.R.S.E., and Hugh Murray, Esq. F.R.S.E. *Being No. II. of the Edinburgh Cabinet Library.* Edinburgh, 1830, Oliver and Boyd; London, Simpkin and Marshall.

THE greater part of this volume is occupied with an analysis of voyages and travels, principally abridged from a work in three volumes, bearing nearly the same title, and published a few years since by one of the present compilers.

This analysis of voyages and travels relates only to Central and Southern Africa, no account being given of either Egypt, Nubia, Abyssinia, or the states of Barbary; and very little being said of either the Great Desert, or the oases of El Onah, Siwah, and El Khargeh. The analysis is clearly and agreeably written; and though it contains nothing very new or very striking, (most of the travels from which it is abridged being in every body's hands,) it may yet be read with both interest and pleasure. We were, however, rather startled to find Mr. Murray implicitly admitting the somewhat apocryphal statements of René Caillié, and giving the following curious reason for his belief.

"His statement, too, with all its defects, bears an aspect of simplicity and good faith, and contains various minute details, including undesigned coincidences with facts ascertained from other quarters. His false reports of celestial phenomena might arise from his ignorance of such subjects; while his inaccuracies in regard to Major Laing might proceed from the defective conveyance of information on which he depended. Perhaps these last form rather a presumption in his favour, since, in composing a forgery, he would probably have brought his statements into a studious agreement with those of the *Quarterly Review*, well known as the only authentic source in this country."

We doubt very much whether M. René Caillié would feel much flattered at having his blunders ascribed to ignorance and credulity; nay, we are not even quite sure that he would be pleased to be complimented on his simplicity; and we were certainly not before aware, that the *Quarterly Review* was "the only authentic source" of information on the subject.

We have, however, faults of a more serious nature to find with the introductory chapter, which professes to give a general view of Africa "in its original state, as it came from the hands of Nature." It is written in a vague, inflated style, alike unsuited to the subject of which it treats, and the readers for whom we presume it is designed. In some parts it is not even

intelligible; and we candidly confess ourselves at a loss to divine how an immense continent, "abounding with the most striking and surprising contrasts," can present, "on a general view, a certain uniformity, approaching almost to monotony." The following passage is also rather alarming for the Africans.

"Africa, considered in relation to her place on the map, forms an extensive continent, situated nearly in the centre of the earth, and obstructing the great highway across the ocean. Her coasts form the chief barrier to a direct maritime intercourse between the distant extremities of the globe. * * * *Could Africa cease to exist, great facilities would be afforded to the communication between the other continents*, and many new channels of commerce would be opened up."

What should we think, if some learned professor of Timbuctoo were gravely to assert, "that England obstructed the highway between America and Sweden;" and that, if our troublesome little island were to be removed, great facilities would be afforded to the communication between the Baltic and the Mississippi!

The name of Professor Jameson made us expect that great light would be thrown upon the obscure and puzzling subject of African geology; but we were disappointed to find the account of the Natron or Trona Lakes is comprised in a short extract from one of Dr. Oudney's letters, published in Denham and Clapperton's travels; that the African rivers are dismissed in half a page; and that many other very curious and interesting phenomena are not even alluded to.

The wood-cuts are very good, and the book is extremely well got up for its very moderate price.

The Siamese Twins, &c. Colburn and Bentley.

[Second Notice.]

THE originality of this poem, together with its satire, will no doubt expose it to a variety and severity of criticism. It will be tried by standards which are not justly applicable to its plan, and it will be judged by opinions which have no consideration of its merits. Before this happens, we are happy to repeat our sentiments, and to say that, taking it as a whole, and disregarding the few blemishes which a hypercritical and hostile examination might point out, we have found so many poetical beauties in it, and, withal, so fine a spirit of philosophical acumen, that we do not hesitate to rank it among the most striking productions of the literature of our period.

This sentence we shall proceed to verify by farther extracts, which display the several qualities we have designated. For the first of these we revert to an early page of the volume, and give the description of a Hindoo temple, visited by the Twins previous to their departure from Siam.

"The jungle is cleared, and the moon shines bright
On a broad and silent plain;
And (gaunt in the midst) the streaming light
Sleeps, hushed on a giant fane!
No late-built, gay, and glittering shrine,
Like those the Boudhist holds divine;
But simple, lone, gray, vast, and hoar,
All darkly-eloquent of old!
The farthest years of untold yore
That temple had beheld.
Sadly and desolately now,
It rais'd to heaven its gloomy brow;
Its altars silent and untrod—
The faith has left the Brahmin's God."

The Twins are witness to a fearful incantation here, which is painted in language of extraordinary force; but we have so much before us, that we must pass it by, and come to part

of an apostrophe "to the grave," which introduces Book III.

"Hearken, O grave! beneath me lying;
Hearken—my heart shall speak to thee!
I know not whose the dust supplying
Thy red and creeping progeny:
No stone is there; the swathing willow
Curtains alone the sleeper's pillow.
But boots it who that couch may claim?
Thy homilies remain the same!
And round thee vibrates the unsolid
And soft air with a moral deep;
And voices vague and disembody'd
O'er thee a fearful vigil keep.
Preacher and prophet, to imbibe
Thy lore, itself the spirit husheth,
And swift and noiselessly a tribe
Of dreams into the silence rusheth.
But dreams like his whose burning lips
Reveal'd the dread Apocalypse,
Glasping, though in a troubled mirror,
The dim but starry truths of fate,
Weird shadows of that world of terror
Or love, to which thou art the gate."

Our next quotation is a vision of love.

"Ere the end be gained, what bright
But half-caught visions haunt the sight!
Back into shade the vision shrinks,
But not its memory of delight!
Flock thousand dim and fairy feelings,
Love only wakes, our spirit o'er;
Vague thoughts we fain would call revealings,
The stars grow lovelier than before;
From our earth's clay a cloud is driven,
And we gaze oftener on the heaven.
There the soft instinct seems to win us;
Something, new-kindled, stirs within us;
The lesser and the lower aims
Of life, the ennobled heart disclaims;
The fervour in its very faults
Refines, and mellow, and exalts."

Possession may content the frame,
And calm, may haply quell, the flame;
But those wild visions and aspirations,
The unbody'd, dream-like, dim desires—
They shun all earthlier fruition!—
They speak an uncompleted doom!
They murmur at the clay's condition,
And pine within us to the tomb!
Yes! love brings something more than love!
A prophet and divine impression,
That that which yearneth here, above
Shall not be all denied possession.
Though dormant in the secret breast
Through the harsh toll, and grinding strife,
And sluggish sleep, that eke the rest
Of the long acts of motley life
Though dormant, may the guest divine
Lurk in its lone discultured shrine;
(For as our gloomy way we grope,
We ask but light from earthly hope,
N'er seeking, and but darkly seeing,
The inward glory of our being):
At once it wakes, and breathes, and moves,
The instant that our nature loves—
No! never human lover knew
A passion deeply felt and true;
And did not, ere his love declined,
Feel the immortal of the mind;
Feel how, unseen and still, we cherish
That something never doomed to perish,
And own the homeward-pining sigh
Of the pent exile of the sky!"

A farewell parting affords some exquisite touches on the same topic.

"We'll meet—once more
I do not say, 'Be true to me,'
I know that deep and tender heart!
I only tell thee, 'Live to see
How lov'd, how truly lov'd, thou art!'
Ah! what are years to those whose thought
Can bear them o'er the gulf of space?
By grief itself my soul hath bought
The right to fly to thine embrace!
Methinks, if when, once more we meet,
The form be bowed, the locks be thin—
'Tis but thy welcome eyes to greet,
To light Youth's lamp once more within!
Age is not made for us—
The past defies its withering breath!
The snows of Time on Love may fall,
And only warm the soil beneath.
Well, weep—weep on! for hearts like ours
Methinks 'tis sometimes wise to weep!
For if our love had flow'd o'er flowers,
It ne'er had been a stream so deep!"

We can only refer readers to the moral drawn from the tale (pages 240 *et seq.*); and, by way of contrast to our last extract, copy a portrait of the *doctor* employed to separate the Siamese.

"This gentleman in black was dress'd;
A noble frill adorned his breast;

An air which, Conrad-like, had damped
Questions absurd—his visage stamped.
In his plain face few charms the lover
Of classic features could discover;
No modish grace leerd forth in him—
Simple his dress, but simply prim:
Yet he who paused to look again,
Saw more than marks the herd of men.
Something about him vaguely said,
"This man could do a deed of dead—
Jesu! defend us from the dead!"
Something about his garb, his gravity,
His smile so sombre in its suavity,
His searching eye, his wrinkled nose,
The tightness of his black smallclothes—
Shewed him, at once, one of that race
Whose spell can pierce the closest place:
Who haunt the coyest solitudes,
And sit beside the bed of prudes.
The chastest maid could scarce deny
His midnight visit never shocked her;
And matrons, should their girls be shy,
Would cry, "What! bashful to the doctor!"
Yes, reader, for the worst prepare—
Think of your poor soul, I implore you!
Your will!—you've not an hour to spare!
A son of Galen is before you!
Pooh! let us not be so malicious,
Your licensed leech is never vicious.
Death from his hands should give no terror;
In him 'tis "Accidental error!"
But quacks who do the art usurp, us,
Like St. John Long, destroy on purpose!
Pouring damned gas, I do assure ye,
Into our lungs, by way of potion,
And making, with infernal fury,
Holes in our poor backs with a lotion!
But this, sweet reader, let me urge on
Your kind remembrance, was a surgeon,
Licensed to do your business ably:
One died with him most comfortably!"

The following admirable lines relate to the anxiety with which one awaits the result of a dreaded surgical operation upon a beloved object.

"All's still! Eternity devours,
Silent and dark, his offspring Hours—
The hours within whose hearts we see
Life, moving in its mystery, centered!
Those separate drops in Time's great sea,
In which we animals leap
To life, from matter's working sleep;
And, after that brief span of strife
In which we play the fool with life;
Not by one millionth of the mass
In the same globule seen, or seeing;
In which to death what millions pass!
Their death the ripeness of new being!
Oh! dark, yet not all starless doom,
The blessing twin-born with the curse!
That frameth one eternal tomb
From the all-teeming universe!
Yet from the reeking jaws of death
Caltheat again the unquenching breath,
Making a universal soul
For green decay but to absorb it,
And life's rejoicing circle roll
For ever through corruption's orbit!
Who hath not some time past the hours
In that sussed, o'erwrought, unresting,
When one loved dearly, with the powers
Of Death's dark angel lies contesting?
How awfully the moments roll
To what unknown and shadowy goal!
While he, perchance, unconscious sleeps,
For whom thy spirit's bitterest trial—
How the clock's solemn chiming keeps
Dread note upon the heart's cold dial!
As scarce you catch the languid moan
That marks the progress of the strife,
How agonising seems your own
Intensity and stir of life!
How idle are all the arts and powers,
The boasted fruit of learned hours!
Nought there to save—nay, more, to ease
One pang, one shiver, of disease!
To gather on the black abyss
Balm for thy heart, or strength for his;
Or with thy worst foe, Thought, to cope,
Save that poor impudence called Hope!
Say, who is fated left to be
A watcher on the bridge of gloom,
Which aways a hair above a sea
Of doubt, despair, and doom!"

We know nothing beyond the depth and impressiveness of this passage: it is enough to redeem a volume; and with it we shall bid adieu to the poem, adding only, as in our last, a few brief examples of thought and expression.

Advice.

"Of these the student spake, and still
The lore grew lovely on his tongue;
For Wisdom's lute needs slender skill,
If not too harshly strung."

A comparison.

"And his flesh and members quivered,
Like a man but just delivered
From a peril or a sin!"

Descriptive.

"Like youth upon a holyday,
The brook sprang freshly on its way:
A noisy voice of gladness sending
Through antique oak, and osier bending
Along its broken marge,
Till in the Thames it dies away:
Its death-bed, reeds and wild flowers (breathing
A requiem faint, but fragrant) wreathing.
And there your step for hours might stay,
Bank, sky, and river, to survey:
The lonely fisher moor'd hard by,
Where yon green islet woe the eye:
The black and heavy barge,
And the light vessel swiftly gliding,
With pleasure and gay hearts presiding.
On either bank the while you see
The cot, the villa, whitely studding
The fair ascent, where many a tree
Into the life of spring is budding."

Grief.

"Hark! there went forth a groan!
By the lattice the boughs were stirr'd,
And the heavy step on the threshold stone,
Of a heavy heart was heard!"
* * * * *
There the wan moon, just risen, cast
A ghastly whiteness o'er the sward."

Life.

"As waters glass a distant star,
We woo some light from heavens afar,
And, imaged in our soul, we dream
The wave that gains, arrests the beam:
Hushed in a false content we stray,
And glide, perchance to gloom, away!"

The production which we have thus illustrated is followed by about seventy pages of miscellaneous poems, the principal of which is entitled "Milton," and is a much improved version of a delightful composition, previously, but very partially, published by the author. We are sorry we can afford but small space to this theme: six lines, indeed, must suffice for Milton's love.

"Her lip grew blanch'd, as with an ominous fear,
And all her heart seemed trembling in her tear.
So worshipp'd he in silence and sweet wonder
The unknown Egeria of his haunted soul;
And Hope, life's chequering moonlight, smiled asunder
The doubts that, cloud-like, o'er him sought to roll."

Of the shorter pieces, the following *jeux-d'esprit* are fair and various specimens.

"If the poor made laws for the rich—the rich,
What a change in our jails would be!
Which would be for the best? and which—oh, which,
Bring the most to the gallows tree?
They would pass a nobleman vagrant bill,
For the fellows who idly roam:
The Travellers' Club would be sent to the Mill,
And Lord E—x be passed to—home.
They'd make game laws for the sporting one,
And refuse a quire to bail!
Old B—ks would be shot with a good spring-gun,
And Sh—y would rot in jail!
'Most libellous trash,' the books that blind
The eyes of the mass they'd call;
Murray's Review would be damnably fined,
And they'd ruin great Captain H—ll.
They'd make it a capital crime to pay
One's-self from the public purse;
Our younger sons would be shipped to 'the Bay,'
And the Bishop of — would!"

"To Juliet: a Thought at Night.

"In yonder taper's waning light,
An image of my heart I see:
It burns amid a lonely night—
Its life the love of thee.
The steadfast light its passion takes,
But slowly wastes while it illumines;
And while my very life it makes,
My life itself consumes."

"On the Imitators of Byron: a Fable.

A swan hymn'd music on the Muses' waves,
And Song's sweet daughters wept within their caves;
It chanced the bird had something then deemed new,
Not in the music only, but the hue—
Black were his plumage;—the rooks that heard on high,
Came envying round, and darkened all the sky;
Each rook, ambitious of a like applause,
Clapped his grave wings, and Pierus rung with caws.
What of the swan's attractions could they lack—
Their noise as mournful, and their wings as black?
In vain we cry—the secret you mistook,
And grief is d-d discordant in a rook!"

And here we end our pleasant task. From Mr. Bulwer's volume we have extracted much food both for reflection and enjoyment; and we trust that the taste and feelings of the great majority of the public will be in unison with ours; in which case much gratification is in store for them, and admiration for the author.

Paris's Life of Sir H. Davy.

[Third notice.]

It is quite delightful to trace the workings of such a mind as that of Davy in the successive discoveries which resulted from his profound researches concerning chemical agency. Thus, we find that so early as Oct. 1800, when engaged at the Bristol Pneumatic Institution, he announced, in a letter to his friend Mr. Davies Gilbert, the dawn of those splendid discoveries which effected in a few years a revolution in our knowledge of the nature of electrical phenomena and chemical agency—"In pursuing experiments on galvanism during the last two months, I have met with unexpected and unlooked-for success. Some of the new facts on this subject promise to afford instruments capable of destroying the mysterious veil which Nature has thrown over the operations and properties of ethereal fluids. Galvanism I have found, by numerous experiments, to be a process purely chemical, and to depend wholly on the oxidation of metallic surfaces, having different degrees of electric conducting power. Zinc is incapable of decomposing pure water; and if the zinc plates be kept moist with pure water, the galvanic pile does not act; but zinc is capable of oxidating itself when placed in contact with water holding in solution either oxygen, atmospheric air, or nitrous or muriatic acid, &c.; and under such circumstances the galvanic phenomena are produced; and their intensity is in proportion to the rapidity with which the zinc is oxidated."

The admission of the great English chemist as a member of the Royal Society, in 1803, of which he afterwards became the president, formed a distinguished era in his life. The first communication he sent to the Society was a paper on galvanic agency, in 1801; but during the year of his admission, he embodied in one elaborate paper all his previous researches connected with the astringent properties of vegetables, and their application in the process of tanning, published in the *Philosophical Transactions* of that year. The remarks of Dr. Paris on the great value of these experiments, are well worthy of the perusal of all persons interested in the various branches of the leather manufactures.

We also particularly recommend to our scientific readers the interesting narrative of those masterly researches which formed the prelude to Davy's most splendid discovery—that of the reduction of alkaline substances to their ultimate or metallic bases; which researches formed the subject of the celebrated Bakerian lecture, read before the Royal Society in Nov. 1807. Our limits enable us only to give the following commentary, at the close of the biographer's account of these profound researches connected with the ultimate analysis of chemical substances.

"Thus, then, was a discovery effected, and at once rendered complete, which all the chemists in Europe had vainly attempted to accomplish. The alkalies had been tortured by every variety of experiment which ingenuity could suggest, or perseverance perform, but all in vain; nor was the pursuit abandoned until indefatigable effort had wrecked the patience

and exhausted every resource of the experimentalist. Such was the disheartening and almost forlorn condition of the philosopher when Davy entered the field: he created new instruments, new powers, and fresh resources; and Nature, thus interrogated on a different plan, at once revealed her long-cherished secret."

Nothing can, however, shew the versatile genius of Davy in a stronger light than the following fact, that, at the very period (Sept. 12, 1807) when he was engaged in those elaborate inquiries respecting the nature of Voltaic agency on the alkalis, and preparing for that celebrated lecture which astonished the scientific world throughout Europe, we find the following passage in one of the many valuable letters addressed to his friend Mr. Davies Gilbert:—

"I have been a good deal engaged, since my return, on experiments on distillation; and I have succeeded in effecting what is considered of great importance in colonial commerce, namely, the depriving rum of its empyreumatic part, and converting it into pure spirit. I mention this in confidence, as it is likely to be connected with some profitable results; and it may be beneficial in a public point of view, by lessening the consumption of malt."

We must pass over the biographer's account of the piscatory qualifications of Davy, to make room for some of the reflections on his successive discoveries:—

"In the progress of our ascent (says Dr. Paris), it is refreshing to pause occasionally, and to cast a glance at the horizon, which widens at every increase of our elevation. By the decomposition of the alkalis and earths, what an immense stride has been made in the investigation of nature! In sciences kindred to chemistry, the knowledge of the composition of these bodies, and the analogies arising from it, have opened new views, and led to the solution of new problems. In geology, for instance, has it not shewn that there are agents in the formation of rocks and earths, which had not previously been known to exist? It is evident that the metals of the earths cannot remain at the surface of the globe; but it is probable that they may constitute a part of its interior; and such an assumption would at once offer a plausible theory in explanation of the phenomena of volcanoes, the formation of lavas, and the excitement and effects of subterranean heat, and might even lead to a general theory in geology."

Our limits compel us to omit the record of numerous particulars and events in the life of Davy, till the year 1812, a period which, on several accounts, produced a material change in the personal character, as well as the scientific labours, of our late distinguished chemist; but we prefer quoting the words and the reflections of his biographer.

"The scientific renown of Davy having attracted the attention of his late majesty, then prince regent, he received from his royal highness the honour of knighthood, at a levee held at Carlton-house, on Wednesday the 8th April, 1812; and it may be remarked, that he was the first person on whom that honour had been conferred by the regent. On the day following this occurrence, Sir Humphry delivered his farewell lecture before the members of the Royal Institution; for he was on the eve of assuming a new station in society, which induced him to retire from those public situations, which he had long held with so much advantage to the world, and with so much honour to himself. How far such a measure was calculated to in-

crease his happiness I shall not inquire; but I am bound to observe, that it was not connected with any desire to abandon the pursuit of science, nor even to relax in his accustomed exertions to promote its interests. It was evident, however, to his friends, that other views of ambition than those presented by achievements in science, had opened upon his mind. The wealth he was about to command might extend the sphere of his usefulness, and exalt him in the scale of society. His feelings became more aristocratic; he discovered charms in rank which had before escaped him, and he no longer viewed patrician distinction with philosophic indifference. On the 11th of April, 1812, Sir Humphry married Mrs. Apreece, the widow of Shuckburgh Ashby Apreece, Esq. eldest son of Sir Thos. Apreece. This lady was the daughter and heiress of Charles Kerr of Kelso, Esq. and possessed a very considerable fortune."

After this period, we find Sir Humphry contributing occasional papers on the more refined branches of chemical agencies, during each succeeding session of the Royal Society; and he also collected his previous researches under a general head, and published, in June 1812, "The Elements of Chemical Philosophy," a work distinguished for its profound and elaborate views of chemical combination. This was followed, in 1813, by the publication of his "Elements of Agricultural Chemistry," of which Dr. Paris justly remarks: "this work may be considered as the only system of philosophical agriculture ever published in this country: it has not only contributed to the advancement of science, but to that upon which the author has an equal claim to our gratitude—the diffusion of a taste amongst the highest classes for its cultivation; for it has been wisely remarked, that not he alone is to be esteemed a benefactor to mankind who makes a useful discovery, but he also who can point out an innocent pleasure. It has been already stated, that Davy became early impressed with the importance of the subject. That in future life its investigation should have been to him so fertile a source of pleasure, may therefore be readily imagined, when it is remembered with what passionate delight he contemplated the ever-varying forms of creation. In the early spring it led him forth upon the fresh turf in the vernal sunshine, to scent the odours of the bank perfumed by the violet and enamelled with the primrose, while his heart participated in the renovated gladness of nature." To this glowing account of the pastoral and agricultural pursuits of our distinguished philosopher, we can only adduce the testimony of every enlightened agriculturist in the kingdom, as to the vast practical advantages that have resulted to this country from improvements of poor soils, and the economy of manures, since the publication of Davy's admirable "Elements."

In the autumn of 1813, Sir Humphry Davy (accompanied by Lady Davy, and Mr. Faraday, the present eminent lecturer at the Royal Institution) having obtained from Buonaparte permission to travel through France, and visit the capital, Dr. Paris informs us, that "the expected arrival of Davy had been a subject of conversation with the French savans for more than a month. Among those who were loudest in his praises was M. Ampère, who had for several years frequently expressed his opinion that Davy was the greatest chemist that had ever appeared. Whether this flattering circumstance had been communicated to the English philosopher, I have no means of ascertaining; but Mr. Underwood informs me, that the very first

wish which Davy expressed, was to be introduced to this gentleman, whom he considered as the only chemist in Paris who had duly appreciated the value of his discoveries; an opinion which he afterwards took no care to conceal, and which occasioned amongst the savans much surprise and some dissatisfaction."

The following little anecdote shews that the great English chemist of the 19th century was not more exempt from a childish superstition on some occasions, than the great English lexicographer of the 18th century.

"Mr. Underwood informs me, that on the 17th Nov. (1813), he met Humboldt at dinner at Davy's hotel; and adds: 'I do not know whether you are aware that Davy had a superstitious dislike at seeing a knife and fork placed crosswise on a plate at dinner, or upon any other occasion; but I can assure you such was the fact; and when it occurred in the company of his intimate friends, he always requested that they might be displaced: whenever this could not be done, he was evidently very uncomfortable.'"

It has been admitted, by many of the warmest admirers of the late Sir Humphry Davy, that during the zenith of his philosophical career he evinced a certain ambition of being considered as the sole discoverer of any new agent or chemical result; which by some persons was interpreted as a species of jealousy of the pursuits of contemporary philosophers. As this remark is peculiarly applicable to his researches on the nature of iodine, we deem it just, both to Davy and his biographer, to give the subjoined statement of the case.

"On the morning of the 23d November, M. Ampère called upon Davy, and placed in his hands a small portion of a substance which he had received from M. Clement; and although it had been in possession of the French chemists for more than twelve months, so entirely ignorant were they of its true nature and composition, that it was constantly spoken of amongst them as X, the unknown body. How far the suggestions of Davy led to the discovery of the chemical nature of this interesting substance, which has been since distinguished by the name of iodine, is a question which has given rise to much discussion on the continent. It has been moreover questioned how far the love of science and the fervour of emulation can justify the interference which Davy is said to have displayed on this occasion. He is accused of having unfairly taken the subject out of the hands of those who were engaged in its investigation, and to have anticipated their results. As his biographer, I feel that it is not only due to the character of Davy, but essentially to the history of science, that these questions should be impartially examined: and I have spared no pains in collecting facts for their elucidation. Mr. Underwood, who was in the constant habit of associating with the parties concerned in the inquiry, has furnished me with some important particulars, and his testimony is fortified by public documents. The substance under dispute was accidentally discovered by M. Courtois, a manufacturer of saltpetre at Paris, but kept secret by him for several years. At length, however, he communicated it to M. Clement, who made several experiments on it, but without any favourable result. On the 23d August, 1813, Clement exhibited to Mr. Underwood the beautiful experiment of raising it into a violet-coloured vapour, and that gentleman assures me that this was the only peculiar property which had at that time been recognised as distinguishing it. A few days previous to this event, M. Am-

père had received a specimen of the substance, which he had carefully folded up in paper, and deposited in his pocket; but, on arriving home, and opening the packet, he was surprised to find that his treasure had vanished. Clement, however, furnished him with another supply, and it was this parcel that Ampère transferred into the hands of Davy; and for which (says Mr. Underwood) he told me, a few days ago, that Thénard and Gay Lussac were extremely angry with him."

Like a zealous advocate for his countryman's scientific reputation, the doctor proceeds, by examining the dates of the papers read by the contending philosophers, to claim the honour of this discovery—"I was (he says) very desirous of ascertaining the feeling which at present prevails amongst the French chemists upon this subject; and I, therefore, requested Mr. Underwood to make such inquiries as might elicit the required information. In a letter to that gentleman, dated Paris, August 22, 1830, he says, 'though Thénard and Gay Lussac retain great bitterness of feeling towards Davy, on account of the affair of iodine, Chevreul and Ampère are still, as they ever were, of opinion, that such a feeling has its origin in a misconception; that what Davy did was from the honest desire of promoting science, and not from any wish to detract from the merit of the French chemists.'"

Now, so far as this evidence goes, it is sufficiently exculpatory of the motives of the English philosopher, in having so hastily undertaken the examination of this new chemical substance; yet the extract which follows shows that there might still have existed strong grounds in the minds of some of the French savans as to the perfect reciprocity of politeness and candour between themselves and the English chemist. In a subsequent page of the memoir, our author observes:—

"Nothing ever exceeded the liberality and unaffected kindness with which the savans of France had received and caressed the English philosopher. Their conduct was the triumph of science over national animosity; a homage to genius, alike honourable to those who bestowed and to those who received it; and it would be an act of ingratitude, a violation of historical justice, on the part of the English biographer, did he omit to express the pride and admiration with which every philosopher in his country continues to regard it. It would have been fortunate for the cause of science, and fortunate for the historian, could he have terminated the subject with these remarks; but the biographer has an act of justice to perform, which he must not suffer his friendship to evade, nor his partialities to compromise. It would be an act of literary dishonesty to assert that Sir Humphry Davy returned the kindness of the savans of France in a manner which the friends of science could have expected and desired. There was a slippancy in his manner, a superciliousness and hauteur in his deportment, which surprised as much as they offended. Whatever opinions he might have formed as to the talents of the leading chemists, it was weakness to betray, and arrogance to avow them."

With all the admiration we feel, in conjunction with his biographer, and almost the whole of the votaries of science, for the splendid genius of Davy, we fear the latter years of the philosopher were clouded by a few other blemishes similar to that before mentioned, but applicable to his own countrymen as well as the scientific men of other countries.

We may still devote a few columns in an-

other No. of our *Gazette* to this highly interesting volume; while we take occasion to recommend it to the scientific world as a compendium, or progressive register, of all the different series of experiments and deductions which led to the most splendid and important discoveries made in modern science.

Memoirs of Dr. Currie, &c. 2 vols. 8vo.

[Second Notice: conclusion.]

HAVING, in our first notice of this work, done justice to its deserts and to the filial spirit of its execution, while we, at the same time, blamed its minuteness and prolixity, we do not consider ourselves called upon to redeem the pledge of another paper by going at length into the details of the second volume. In truth, there is much of it which it would have been better to have omitted; and one volume might have been found both more effectual and acceptable to the general public, however grateful two volumes may be to private and affectionate feelings. Much is written about the pamphlet of Jasper Wilson (i. e. Dr. Currie); but surely the ablest political letter of that date has no such attractions now, when the aspect of the world has been so completely changed by many wonderful events. Yet there are just and fine remarks interspersed in this correspondence; for instance: "The favour of mankind comes late to those who depend upon it, but the multitude delight to patronise those who have no need of their assistance."

On Medical Practice.—"In consultations with younger physicians, I have at times observed two opposite inconveniences. Where the junior has spoken first, he has sometimes given his opinion in such strong terms as to render any opposition to, or modification of, his sentiments more difficult than is desirable. On the other hand, I have known, where the senior was expressing his opinion, an eagerness to join with him lead the other to take the words out of his mouth (if I may so speak), and express in strong terms his assent to a mode of practice which, after all, may not have been exactly that which the former intended to propose. In one instance I was not long since brought into a considerable difficulty by a complete mistake made in this way, on an occasion of the greatest importance, and where a life most valuable was concerned. The remedy for these evils (if you judge them of sufficient importance) would be a rule, requiring the physician speaking first (and so in succession) to avoid peremptory terms, and to employ guarded and modest expressions; with another rule, assuring to each an uninterrupted hearing. These points seem more important in proportion as the number in consultation is greater, and may, on that account, be worth attention at your infirmary, where, I think, more of the profession act together than in any other institution in the kingdom."

On Governments.—"All governments are founded on opinion. We submit, because the king is our master and we are his slaves, say the Easterns; because he is our father and we are his children, say the Chinese and European monarchies; because submission to law and government is useful, say the freemen of America, and many of those of England. Now, of these natural foundations, the last appears the strongest, provided experience had clearly marked out the objects to which this usefulness required government to extend, and time had produced habitual submission and respect. What France has wanted is not proper foundations or principles, but science or practical skill. It is one thing to understand the principles of

mechanics; it is another to build a ship. The government they raised was ill-constructed, its parts ill-suited. The balance, as far as experience goes, is the true system, and the proper division of powers. Republics or representative governments are as capable of these as our own constitution, two parts of which are hereditary. France will learn—she has got the true foundation, practice will tell her the edifice that is best. I detest the spirit and character of the Jacobins; but great changes are never produced by amiable, polished, and refined characters. Superstition, in the days of ignorance, is a giant—truth a dwarf. But enthusiasm is the Hercules sent by Heaven to combat this monster; to attack a savage with a savage's strength. You detest Luther, and Calvin, and Knox; so do I. Heaven forbid I should live with such men! But they produced the Reformation, and that was a mighty thing. Finer minds would not have encountered the hazard. What did Erasmus in the days of Luther? What would Blair have done in the days of Knox? I cannot deny that coarser, and perhaps less principled, men than Lafayette and Rochefoucauld were necessary to complete the triumph of France, and that Pétion and Dumourier were what the season required. I put things together roughly, but you will comprehend me. In regard to the extent to which the agitation may go, I should apprehend Europe will hardly bound it. The combat will be renewed again and again between old superstition and young enthusiasm; and the issue will, I dare say, be generally favourable to the last. See Hume's *Essay on Superstition and Enthusiasm*. My notion is, that all governments will finally be reduced to the system of utility, and that in proportion as they now differ from this, may the changes be expected to be. Judging in this way, our own government requires, I think, reformation only."

On Education.—"My notion of education, in its earlier parts, is like my idea of a national government: that it should be chiefly negative or preventive, so to speak, extending to as small an abridgment of liberty as possible, but absolute on the points on which it interferes; and that the faults attending it in general are, like the faults in governments in general, an interference where no interference is required, on a number of foolish points, to the injury of the human faculties, and to the neglect of those points which are essential. The analogy will not hold good as to the more advanced parts of education, because its objects then are to teach and instruct; whereas those of government should be confined, in my judgment, almost entirely to restraint."

On Parliamentary Reform.—"This scheme of equal representation is usually accompanied with the proposal for short periods of delegation, and other methods to make the delegate speak the sense of his representatives. But, under this system, the great majority of representatives being persons without property, the security of property to those who had it, would depend on the virtue of those who had none. If, on the other hand, it be supposed (what I am inclined to admit) that among a people considerably informed, and capable of fixed habits, such as our countrymen, the inviolability of property may be safely trusted to the sense of right, a danger presents itself of an opposite nature. Property being secured to the individual, however largely it may have accumulated, would probably operate with irresistible influence on the great mass of the labouring poor, of which three-fourths of the electors would con-

sist; and the union of two or three men of large fortune, in every county or district, would bear down every opposition from talents, activity, or virtue.

"It seems, then, that an extension of the elective franchise should be accompanied with certain reforms in the laws of property. This being conceded to me, I confess I should still not be disposed to go the length of a representation of heads. The young, the idle, the profligate, and those wretchedly poor and ignorant, form a large class of society, that do not sufficiently understand or sympathise in the interests of the whole; and those I would propose to exclude, in a great measure, by adopting another fundamental principle: giving the elective franchise, not to persons, but to families; in a word, to the fathers of families only. Such men have a valuable stake in the community, however small their property; and they are (not without many exceptions, indeed) a selection from the general mass, as to sobriety and industry. By adopting this principle, the greater and most dangerous part of the mob of great cities would be excluded; the greater part of the army and navy, and almost all the servants of great families—perhaps as vicious and dangerous a part of the community as any other—being who possess at the same time the vices of luxury and ignorance."

Surely there is much room for speculation, even in our day, upon these thoughts, which bespeak a man of a good heart and a sound understanding. But we pass to the history of a philosopher: we have met with several of the same genus.

"A gentleman of a liberal education had, according to the fashion of the times, indulged himself, some years ago, in speculations on the improvement of the human race, and the perfectibility of man. By long, deep, and solitary meditation on these subjects, his mind became unsettled, and his reason gave way. He seemed to himself to want nothing but power to make mankind happy; and at length he became convinced that he had a right to that power. The consequence of this rendered it necessary to confine him; and about two years afterwards he was removed by his friends from the situation in which he was originally fixed, and placed under my care. At the time of which I speak he was become perfectly calm: he was on general subjects rational, and on every subject acute; but the original hallucinations were as fixed as ever. In occasional discussions of his visionary projects, I had urged, of my own suggestion, the objection, that when men became so happy as he proposed to make them, they would increase too fast for the limits of the earth. He felt the force of this; and, after much meditation, proposed a scheme for enlarging the surface of the globe, and a project of an act of parliament for this purpose, in a letter addressed to Mr. Pitt, very well expressed, and seriously meant, but which, if published, would appear satirical and ludicrous in a high degree. Having had occasion to mention his situation to his brother, a man of letters, he proposed that an experiment should be made of putting the quarto edition of *Malthus's Essay* into his hands, to which I assented. It was given to him last autumn, and he read it with the utmost avidity and seeming attention. In my visits I did not mention the subject to him, but desired the keeper to watch him narrowly. After finishing the perusal, he got pen, ink, and paper, and sat down, seemingly with an intention to answer it, or to write notes upon it. But he did not finish a single sentence, though he began many. He

then sat down to read the book again, aloud, and finished this second perusal in a few days, not omitting a single word, but stopping at times, and apparently bewildered. I now spoke to him, and introduced the subject, but he was sullen and impatient. He became very thoughtful, walked at a great pace in his airing-ground, and stopped occasionally to write, if I may so speak, words, but more frequently numbers, with a switch in the sand. These he obliterated, as I approached him. This continued some days, and he appeared to grow less thoughtful; but his mind had taken a melancholy turn. One afternoon he retired into his room, on the pretence of drowsiness. The keeper called him in a few hours, but he did not answer. He entered, and found the sleep he had fallen into was the sleep of death. He had 'shuffled off this mortal coil.' * * *

I have no doubt that he perceived sufficiently the force of Malthus's argument to see the wreck of all his castle-building, and that this produced the melancholy catastrophe."

Perhaps Malthus would be very glad to have his work prescribed universally; since, if it produced these effects, it would at once co-operate with his system by reducing population, and put a large fortune into his pocket by the sale of his "Principles."

With this story we conclude; repeating that, for those who have sufficient leisure, there is much to amuse and inform in this publication; while the busy, who are pressed for time, may justly complain of its dwelling tediously on unimportant topics.

Voyages of the Companions of Columbus.

[Second Notice: conclusion.]

Of all the daring men who immediately succeeded the great and enterprising Columbus, Vasco Nuñez, the first who saw and navigated the vast Pacific Ocean, was one of the most remarkable in all the details of his perilous course. Among his followers was a bloodhound, named Leoncico, which the Spanish writers describe as his constant companion and body guard.

"He was of a middle size, but immensely strong: of a dull yellow or reddish colour, with a black muzzle, and his body was scarred all over with wounds, received in innumerable battles with the Indians. Vasco Nuñez always took him on his expeditions, and sometimes lent him to others, receiving for his services the same share of booty allotted to an armed man. In this way he gained by him, in the course of his campaigns, upwards of a thousand crowns. The Indians, it is said, had conceived such terror of this animal, that the very sight of him was sufficient to put a host of them to flight." *

The discovery of the Pacific Ocean, after a toilsome march from Darien, is finely told:—

"The day (26th of September, 1513) had

* These terrible animals were powerful allies to the Spaniards; for, besides many other notices of them, we are told of Juan Ponce, that "one of his most efficient warriors was a dog named Berzelio, renowned for courage, strength, and sagacity. It is said that he could distinguish those of the Indians who were allies, from those who were enemies of the Spaniards. To the former he was docile and friendly, to the latter fierce and implacable. He was the terror of the natives, who were unaccustomed to powerful and ferocious animals, and did more service in this wild warfare, than could have been rendered by several soldiers. His prowess was so highly appreciated, that his master received for him the pay, allowance, and share of booty assigned to a cross-bow man, which was the highest stipend given. This famous dog was killed some years afterwards by a poisoned arrow, as he was swimming in the sea in pursuit of a Carib Indian. He left, however, a numerous progeny and a great name behind him; and his merits and exploits were long a favourite theme among the Spanish colonists."

scarce dawned, when Vasco Nuñez and his followers set forth from the Indian village, and began to climb the height. It was a severe and rugged toil for men so wayworn; but they were filled with new ardour at the idea of the triumphant scene that was so soon to repay them for all their hardships. About ten o'clock in the morning they emerged from the thick forests through which they had hitherto struggled, and arrived at a lofty and airy region of the mountain. The bold summit alone remained to be ascended; and their guides pointed to a moderate eminence, from which they said the southern sea was visible. Upon this, Vasco Nuñez commanded his followers to halt, and that no man should stir from his place; then, with a palpitating heart, he ascended alone the bare mountain-top. On reaching the summit, the long-desired prospect burst upon his view: it was as if a new world were unfolded to him, separated from all hitherto known by this mighty barrier of mountains. Below him extended a vast chaos of rock and forest, and green savannahs and wandering streams, while at a distance the waters of the promised ocean glittered in the morning sun. At this glorious prospect Vasco Nuñez sank upon his knees, and poured out thanks to God for being the first European to whom it was given to make that great discovery. He then called his people to ascend. 'Behold, my friends,' said he, 'that glorious sight which we have so much desired. Let us give thanks to God that he has granted us this great honour and advantage; let us pray to him to guide and aid us to conquer the sea and land which we have discovered, and which Christian has never entered to preach the holy doctrine of the evangelists. As to yourselves, be as you have hitherto been, faithful and true to me, and by the favour of Christ you will become the richest Spaniards that have ever come to the Indies; you will render the greatest services to your king that ever vassal rendered to his lord; and you will have the eternal glory and advantage of all that is here discovered, conquered, and converted to our holy Catholic faith.' The Spaniards answered this speech by embracing Vasco Nuñez, and promising to follow him to death. Among them was a priest, named Andres de Vara, who lifted up his voice and chaunted *Te Deum laudamus*, the usual anthem of Spanish discoverers. The rest, kneeling down, joined in the strain with pious enthusiasm and tears of joy; and never did a more sincere oblation rise to the Deity from a sanctified altar, than from that wild mountain-summit. It was, indeed, one of the most sublime discoveries that had yet been made in the New World, and must have opened a boundless field of conjecture to the wondering Spaniards. The imagination delights to picture forth the splendid confusion of their thoughts. Was this the great Indian Ocean, studded with precious islands abounding in gold, in gems, and spices, and bordered by the gorgeous cities and wealthy marts of the East? or was it some lonely sea, locked up in the embraces of savage uncultivated continents, and never traversed by a bark, excepting the light pirogue of the savage? The latter could hardly be the case, for the natives had told the Spaniards of golden realms, and populous and powerful and luxurious nations upon its shores. Perhaps it might be bordered by various people, civilised in fact, though differing from Europe in their civilisation; who might have peculiar laws and customs, and arts and sciences; who might form, as it were, a world of their own, intercommuning by this mighty sea, and carrying on commerce between their own islands and

continents, but who might exist in total ignorance and independence of the other hemisphere."

They descended to the sea, and, "stooping down, tasted its waters. When they found that, though severed by intervening mountains and continents, they were salt like the seas of the north, they felt assured that they had indeed discovered an ocean, and again returned thanks to God."

Vasco Nuñez, on his return to Darien, was cruelly beheaded as a traitor, through the perfidiousness of the governor.

Juan Ponce's adventures are more amusing; for, being superseded in Porto Rico, our author tells us—"The loss of one wild island and wild government was of little moment, when there was a new world to be shared out, where a bold soldier like himself, with sword and buckler, might readily carve out new fortunes for himself. Beside, he had now amassed wealth to assist him in his plans, and, like many of the early discoverers, his brain was teeming with the most romantic enterprises. He had conceived the idea that there was yet a third world to be discovered, and he hoped to be the first to reach its shores, and thus to secure a renown equal to that of Columbus. While cogitating these things, and considering which way he should strike forth in the unexplored regions around him, he met with some old Indians, who gave him tidings of a country which promised, not merely to satisfy the cravings of his ambition, but to realise the fondest dreams of the poets. They assured him that, far to the north, there existed a land abounding in gold and in all manner of delights; but, above all, possessing a river of such wonderful virtue, that whoever bathed in it would be restored to youth! They added, that in times past, before the arrival of the Spaniards, a large party of the natives of Cuba had departed northward in search of this happy land and this river of life, and, having never returned, it was concluded that they were flourishing in renovated youth, detained by the pleasures of that enchanting country. Here was the dream of the alchemist realised! one had but to find this gifted land and revel in the enjoyment of boundless riches and perennial youth! nay, some of the ancient Indians declared that it was not necessary to go so far in quest of these rejuvenating waters, for that, in a certain island of the Bahama group, called Bimini, which lay far out in the ocean, there was a fountain possessing the same marvellous and inestimable qualities. Juan Ponce de Leon listened to these tales with fond credulity. He was advancing in life, and the ordinary term of existence seemed insufficient for his mighty plans. Could he but plunge into this marvellous fountain or gifted river, and come out with his battered war-worn body restored to the strength and freshness and suppleness of youth, and his head still retaining the wisdom and knowledge of age, what enterprises might he not accomplish in the additional course of vigorous years insured to him! It may seem incredible, at the present day, that a man of years and experience could yield any faith to a story which resembles the wild fiction of an Arabian tale; but the wonders and novelties breaking upon the world in that age of discovery almost realised the illusions of fable; and the imaginations of the Spanish voyagers had become so heated, that they were capable of any stretch of credulity. So fully persuaded was the worthy old cavalier of the existence of the region described to him, that he fitted out three ships at his own expense to

prosecute the discovery, nor had he any difficulty in finding adventurers in abundance ready to cruise with him in quest of this fairy-land."

Need we add that, examining the whole group of the Bahama islands, "his inquiries for the island of Bimini were all in vain; and as to the fountain of youth, he may have drank of every fountain, and river, and lake, in the archipelago, even to the salt pools of Turk's Island, without being a whit the younger."

He, however, discovered and took possession of Florida; but, "disheartened at length by the perils and trials with which nature seemed to have beset the approach to Bimini, as to some fairy island in romance, he gave up the quest in person, and sent in his place a trusty captain, Juan Perez de Ortubia, who departed in one of the other ships, guided by the experienced old woman of the isles, and by another Indian. As to Juan Ponce, he made the best of his way back to Porto Rico, where he arrived infinitely poorer in purse and wrinkled in brow, by this cruise after inexhaustible riches and perpetual youth. He had not been long in port when his trusty envoy, Juan Perez, likewise arrived. Guided by the sage old woman, he had succeeded in finding the long-sought-for Bimini. He described it as being large, verdant, and covered with beautiful groves. There were crystal springs and limpid streams in abundance, which kept the island in perpetual verdure, but none that could restore to an old man the vernal greenness of his youth. Thus ended the romantic expedition of Juan Ponce de Leon. Like many other pursuits of a chimera, it terminated in the acquisition of a substantial good."

These extracts will speak for the merit of this volume; and we have only further to notice, that it concludes with a very interesting narrative of a pilgrimage to Palos, (whence Columbus sailed to discover the New World, and where the descendants of the Pinzons still live in patriarchal happiness,) which was most appropriately made by so distinguished a citizen of that New World as Washington Irving.

Constable's Miscellany, Vol. LXIII. The Achievements of the Knights of Malta. Vol. I. By Alexander Sutherland, Esq. author of "Tales of a Pilgrim." Edinburgh, 1831, Constable and Co.; London, Hurst, Chance, and Co.

MUCH industry has been bestowed on this volume, which, both for research and style, does Mr. Sutherland infinite credit. The beginning is taken up by the Crusades; an era every detail of which has been lately so fully before the public that we cannot find novelty for quotation. The ensuing anecdote is from the later period, which has much romantic interest.

"Bajazet having thus, by the celerity and secrecy of his march, and the order and evolutions of his army on the day of battle, totally overthrown the Christian army, proceeded to take a bloody revenge for the massacre which the French knights had perpetrated on the eve of the engagement. The Count of Nevers, and twenty-four lords of distinction, including the Sire de Coucy, and the Marshal Boucicault, were reserved for ransom; but the remainder of the captives were brought before his throne, and, on their refusal to abjure their faith, were successively decapitated in his presence—a sacrifice which deluged France with tears. The Sire de Coucy and Count D'Eu died in prison; but the other princes and barons, after being long exposed as a grateful trophy to the Moslems of Europe and Asia, were ulti-

mately ransomed for two hundred thousand ducats. It was stipulated in the treaty, that the French captives should bind themselves by oath, never again to bear arms against their conqueror; but Bajazet scornfully rejected the proffered pledge. 'I despise,' said he to the heir of Burgundy, 'thy oaths and thy arms. Thou art young, and mayest be ambitious of effacing the disgrace or misfortune of thy first field. Marshal thy troops, proclaim thy enterprise, and be assured, that thou canst not do Bajazet a greater favour than by giving him another opportunity of meeting thee in the shock of fight.'"

We look forward with pleasure to the second volume, where the author will be on untrodden ground.

The Ladies' Museum. New and improved Series. No. I. London, 1831. Simpkin and Marshall.

EMBELLISHED with a very beautiful engraving of Finden's, from a picture of Howard's, "The Cottage Girl," (previously published, we believe,) and with a very varied table of contents, the *Ladies' Museum* appears to us the best of the novel competitors for female favour. We confess to having taken "feminine counsel's opinion" on the gaily arrayed figures that set forth the fashions, and the report has been favourable: the two evening dresses are pronounced "specially pretty."

Allan M'Dougal: or, Scenes in the Peninsula: a Tale. By a Military Officer. 3 vols. 12mo. London, 1831. Newman and Co.

THESE are three amusing volumes: the military scenes are really sketched with great spirit; and the character of the hero places the consequence of a vain craving for excitement in a true, and therefore forcible, point of view.

The Mayor of Garratt, &c. Pp. 45. London, 1831. Alf. Miller.

FOOTE's comedy, illustrated with clever and characteristic designs by R. Seymour, and well out in wood by Nesbit, Slader, Welch, and Johnson. It is one of the neat and cheap editions of the day.

Belgium in 1830. Pp. 48. London, 1831. Colburn and Bentley.

A PAMPHLET written, we are told, by Prince Kosloffsky, in which he sets out by sacrificing intelligence, if not truth, to expediency (see first page), but, nevertheless, in the course of his remarks throws very considerable light upon the revolution in Belgium, its actors, and its probable effects on Europe. The work is evidently meant to support the cause of the Prince of Orange, and to recommend him to the throne, which seems to be begging an occupant.

The Daughter of Herodias: a Tragedy. By Henry Rich, Esq. 8vo. pp. 188. London, 1831. J. Andrews.

WE do not think the subject of this tragedy is well chosen: our opinions on all histories connected with the sacred one are so strongly defined from childhood upwards, that any author placing such events in an opposite light to that in which we have been accustomed to consider them, sets the whole array of early feelings and prejudices against him. We mean only as refers to our imagination; for, both in a religious and moral point of view, these scenes are beautifully drawn. The touches of feeling and of poetry in the following passages may speak for themselves.

"You must have been a happy life, poor novice,
Not to have learnt, the more man wrongs, the more
He hates.

"We had a common father;
Dost thou remember him? I well remember
How oft at eventide, when I had sung
That prayer you loved to teach his orphan boy,
How as the light grew less, and all was still
Within our narrow home, ere I retired
To rest, how you would draw me to yourself,
And tell fond tales of days that I remembered not,
While tears of yours fell fast and sweet.

"How changed is this cold dreary world to me!
Once could I smile, and think all nature smiled
Again on me, while I could court the brooks,
The valleys, and the mountains, and find joy
And beauty in them all, and with light heart
And bounding spirits, breathe the giddy air
That danced in joyful eddies round my brow;
Thence could I contemplate the world below
With unpropitious eye, see nought but peace
And happiness in life; then turning home,
Nestle in a friend's, a father's, mother's lap,
And with warm heart and ready tongue lip out
My joys, my wishes, and my love; could feel
A cheerful eye respond to mine whereso'er
I turned, and view content and mild serenity
Gathering around; I could unburthen all
My little cares, and live in confidence
And free expression of each opening thought
That rose unchecked within my happy mind."

Of all futures, that of poetry is the most
difficult to foresee; but though, as a whole, we
think this drama unequal, and that it does not
assume a popular form, yet there are traces of
thought and feeling which lead us to expect
something much superior from its author.

Lays from the East. By Robt. C. Campbell.
12mo. pp. 252. London, 1831. Smith and
Elder.

We always regret when individuals of good
feeling, taste, and sense, mistake their talents
for the inspiration of poesy, and are tempted
to publish what ought never to have gone be-
yond the private circle of albums, or, at far-
thest, the columns of a periodical. Such are
Mr. Campbell's *Lays from the East*.

The Book of the Seasons. By William Howitt.
pp. 404. Colburn and Bentley.

This pleasing volume has just reached us. It
seems full of nature and good feeling.

*Family Library, XIX. The Lives of the most
Eminent British Painters, &c.: Architects.*
By Allan Cunningham. Murray.

WITH the lives of William of Wykeham,
Inigo Jones, Wren, Vanburgh, Gibbs, Kent,
Lord Burlington, and Sir William Chambers,
Mr. Cunningham has here made a very nice
volume.

ARTS AND SCIENCES.

LINNEAN SOCIETY.

EDWARD FORSTER, Esq. in the chair. — A
paper, from the pen of Robert Hill, Esq. F.L.S.
on a species of deer (*Cervus macrurus*) which
inhabits the eastern side of the Rocky Moun-
tains, near Hudson's bay, was read. The
paper was accompanied by drawings of the
head and horns. This species derives its name,
as may be readily anticipated, from the salu-
tary habits of the animal, which is never seen
to use the paces of the other deer; and appears
to form an intermediate link between the rein-
deer and roe-buck, to both of which it ap-
proaches in certain characters. Another com-
munication, on the structure and economy of
spiders, by John Blackwall, Esq. F.L.S. was
also read. To this paper we may hereafter
refer. Several fellows were elected.

ROYAL ASTRONOMICAL SOCIETY.

SIR JAMES SOUTH in the chair. A consid-
erable number of fellows and associates were

elected into the Society. The following papers
were read:—1st. A method of computing oc-
cultations, by Mr. MacLear. 2d. A letter
from Professor Nicolai, with his observations,
and those of Professor Sverd, of Venus about
her inferior conjunction, and of the comet
discovered by Gambart. 3d. A letter from
Professor Santini, with observations of the
right ascension of Venus about her inferior
conjunction, as recommended by Professor
Airy, and also containing observations of the
comet discovered last year by Gambart. 4th.
A letter from Professor Bianchi, containing
observations on the same subject. 5th. A let-
ter from Professor Struve, with observations
of the occultation of Aldebaran and other
stars by the moon, at Dorpat. 6th. Two notes
by Mr. Lubbock, upon the comet of Halley.
Sir James South informed the meeting that
the King had been graciously pleased to become
the patron of the Society, and that the nego-
tiations respecting the charter were nearly
completed.

BRITISH MUSEUM.

A LARGE and elegant apartment has been
opened to the public during last week, contain-
ing a collection of foreign birds, the greater
part of which are in a very bad state of preser-
vation. The tables contain a general collection
of shells, the British species being very prop-
erly left to accompany the British birds. Among
them we remark some valuable presentations
from Captain Lord Byron; Captains Owen,
Beechey, and Ross; Messrs. Barrow, Swainson,
Hennah, and Ritchie who died in Africa.
There are illustrations of rare species from
America, by Messrs. Say and Green; from
Marseilles, by Risso; and from Newcastle, by
Mr. Alder, a promising member of the Natural
History Society of that town. We find, from
our survey, that it is only by the most modern
navigators and travellers that additions have
been made to this public collection, for which,
as a national museum, we hope, if the same
spirit continues to prevail, we shall no longer
have to blush; and therefore trust, that the
care and arrangement of these valuable ob-
jects will be placed in proper hands; for who
will collect or make presentations, if these, as
has hitherto been the case, lie for years ne-
glected in obscure cellars?

The collection of fossil univalves is excellent.
Where are the bivalves? And, before we quit
this subject, let us be allowed to express a hope,
that the public will not be long debarred access
to the mineralogical collection.

HORTICULTURAL SOCIETY.

J. A. HENDERSON, Esq. in the chair. A very
interesting paper was read, entitled "An In-
quiry into the Nature and Constitution of the
Sap-vessels of Plants," by the author of the
"Domestic Gardener's Manual." After no-
ticing, at some length, the opinions of M. Du-
rochet and others on vegetable physiology, the
writer concludes with the following remarks
on the spiral vessels of plants:—"These ves-
sels," he says, "may act mechanically as springs,
for their elasticity is prodigious. They exist in
almost all plants, and the peculiarity of their
structure, which closely resembles the coiled
spring of a bell-wire, argues strongly that they
have other functions allotted to them than that
of merely conducting the sap. If, indeed, they
are appendages to the sap-vessels,—if they
wrap round and enclose, or are themselves
placed internally within the membranous coat
of those vessels,—(and the author is much in-
clined to believe that they are so, for the closest

observation of the vessels of the flower-stalk
of the wild hyacinth, *scilla nutans*, convinced
him that the spiral coil is by no means closely
compressed, but is apparently enclosed, or en-
closes a fine filmy membrane);—if this be the
case, then these spiral vessels may be most
efficient mechanical agents in propelling the
sap upwards. The pliancy of trees, the readi-
ness with which they yield to the force of the
winds, and the facility with which they recover
their upright position, are facts strongly cor-
roborating the idea,—that they contain in-
ternal springs, which, like coils of bell-wire,
are capable of receiving and supporting motion
in every direction, without offering imped-
iments or sustaining injury."

Several varieties of the apple and pea were
exhibited.

THE COMET.

ON Tuesday, at 14^h 14^m 10^s, sidereal time, the
indefatigable Sir James South obtained another
glimpse of the comet, and ascertained its right
ascension to be 16^h 51^m 6^s, and its southern de-
clination 9° 20' 11". Its right ascension in
time, he observes, is diminishing nearly 4^m, and
its southern declination almost 18^m daily. It is
about 1° north of 20 Ophiuchi, and follows it
about 11^m of time; forming nearly an isosceles
triangle with α and ζ of that constellation.
With these data, its future course may readily
be traced; and we hope foreign astronomers
may have had clearer skies than we have had,
to mark its elements and progress.

Mr. Herapath also observed the comet again
about the same period. He accords very closely
with Sir James South; and adds, not only that
its retrograde motion is confirmed, but that
"it is much higher in the heavens than it was,
and exceedingly increased in the length and
splendour of its tail;" which he considers, if
it be really moving from the sun, an extraor-
dinary phenomenon. A correspondent of the
Times newspaper, at Liverpool, where it has
also been observed, is of opinion that it has
passed its perihelion. He also conjectures that
it may be the comet of 1770, which passed the
nearest to the earth, and engaged the researches
of Lexel and Burckhardt; in which case, it
would be moving to its perihelion, and about
to complete its eleventh revolution of five and
a half years since that period.

NEW PUBLICATIONS.

*Proceedings of the Committee of Science and
Correspondence of the Zoological Society of
London.* 8vo. Pp. 16.

THE Zoological Society of London was fully
aware, at its first establishment, that, to ensure
the success of zoology in this country, it was
necessary to render its study popular and at-
tractive; and this was only to be accomplished
by expensive means, such as the establishment
of a menagerie and a museum, and the publica-
tion of illustrated and entertaining works; so
that a large accession of members was requisite
to defray these expenses. And there are many
who belong to the institution, who are hardly
aware that the scientific part of that body have
resolved themselves into a committee for the
prosecution of their favourite pursuit. We
have before us the first fasciculus of their la-
bours, which is full of valuable information,
and promises extremely well. Among other
interesting notices, we observe a monograph
by Mr. Vigors, on the Quails of the New
World, which have all been arranged under
the generic title of *Ortyx*,—the quails of the
Old World belonging to the genus *Coturnix*.
Only two well-ascertained species of these were

a few years back known to ornithologists; but now we have eleven species, not including the quail from the Straits of Magellan, brought home by Captain King, and which, in the structure of the wing, associates more closely with the group of the Old World; uniting the zoology of the southern extreme of the New World with that of the nearest portions of the southern hemisphere, in like manner as the zoology of the northern extreme is united with that of the neighbouring continents of Europe and Asia.

The collection of birds, of Mr. J. Gould, from the Himma-leh mountains, many of them undescribed, exhibit an identity in a large proportion of their forms with those of northern Europe, the elevation of their native mountains placing them on an equality, in point of climate, with the birds of more northern latitudes. Many of the forms peculiar to southern Asia and the Indian archipelago are also found intermingled with those of the northern regions. Among the forms similar to the European, Mr. Vigors particularised three species of jays, two of which exhibited a striking affinity in their markings to our well-known British bird. The rest in form and other characters, approached the nutcrackers. Two species of woodpeckers verged most closely, in size and colouring, on the European green woodpecker. Among the forms peculiar to India was observed a second species of the singular group which contains the horned pheasant, or the *Meleagris satyra* of Linnaeus, and which has been lately separated by Cuvier, under the name of *Tragopan*. A third species was likewise added, from the collection, to the group of *Enicurus* (*E. maculata*) of Temminck, which has hitherto been considered as limited in range to the Indian Archipelago.

Dr. Smith, a most laborious naturalist at Cape Town, has also made additions to the zoology of that district, of a new species of the *Macrosclides*, as well as a new one of *Erinaceus*, and three species of the genus *Otis*, together with one of *Brachypteryx*. The first, *Macrosclides rupestris*, was found by Dr. Smith in the mountains near the mouth of the Orange River. In the genus *Otis*, the *O. Vigorsii* inhabits the most dry and barren situations in the south of Africa; the *O. ferox* is found in the country towards Latakoo; and the *O. Afrasides* is met with on the flats near the Orange River. The *Brachypteryx Horsfieldii* is met with on high rocky situations. Besides these additions, there are also sixteen specimens of fishes.

As might have been anticipated, the voyage of Captain King has been most productive in objects of natural history, more especially in ornithology; and this fasciculus contains descriptions of numerous new and interesting species from the Straits of Magellan; and altogether it forms an excellent epitome of the labours of the scientific committee of the Society.

LITERARY AND LEARNED.

ROYAL SOCIETY.

HIS Royal Highness the Duke of Sussex in the chair. The reading of Mr. Ivory's paper on the equilibrium of fluids, and the figure of a homogeneous planet in a fluid state, was resumed. Sir Martin Archer Shee, Knt. President of the Royal Academy, was proposed. Henry Percy Gordon, Esq. was admitted. Wm. John Blake, Esq. Christ Church, Oxford, was elected. Amongst the donations to the Society, was Professor Bessel's valuable

Tables for astronomical reductions from 1750 to 1850.

At a preceding meeting a paper was read, of which the following is an abstract, entitled, "On the nature of negative and imaginary quantities," by Davies Gilbert, Esq., President.

The object of this paper, the author observes, is one that has given rise to much controversy, and has been wrapped in much unnecessary mystery. Paradoxes and apparent solecisms, when involved with facts and indubitable truths, will always be found, upon accurate examination, to be near the surface, and to owe their existence either to ambiguities of expression, or to the unperceived adoption of some extraneous additions or limitations into the compound terms employed for definition, and which are subsequently taken as constituent parts of their essence. The first misapprehension pointed out, is that of considering any quantity whatever as *negative per se*, and without reference to another opposed to it, which has previously been established as *positive*. In order to avoid preconceived associations of ideas, the author prefers employing in his reasonings on this subject, the symbols (a) and (b) to express this quality of opposition, rather than the usual ones of *plus* and *minus*. By the aid of this notation, he is enabled to present, in its full generalisation, the law of the signs in multiplication, a process which it is well known is founded solely upon the principle of ratios; and to shew that like signs invariably give the sign belonging to the assumed unity and universal antecedent of the ratios; and unlike signs the contrary.

Since either the one or the other of the arithmetical scales derived from the two unities is in itself equally affirmative, but negative with relation to the other, it follows, that by using the scale of (b), all even roots in the scale of (a) will become imaginary; and thus the apparent discrimination of the two scales is removed; so that the properties belonging to the two scales are interchangeable, and all formulae become universally applicable to both, by changing the signs according to the side in which the universal antecedent is taken. Imaginary quantities, then, are merely creations of arbitrary definitions, endowed with properties at the pleasure of him who defines them; and the whole dispute respecting their essence turns upon the very point that has been contested, from the earliest times, between the hostile sects of realists and nominalists.

It is now, however, universally agreed, that all abstractions and generalisations are mere creatures of the reasoning faculty, existing no where but in the mind contemplating them. Such in algebra are the supposed even roots of a real quantity taken in the scale opposite to that which has given the universal antecedent; the sign indicating the extraction impossible to be performed, veils the real quantity, and renders it of no actual value until the sign is taken away by an involution the reverse of the supposed operation which the sign represents; although the quantity itself is in the meantime, by its arbitrary essence, made applicable to all the purposes for which real quantities are used in every kind of formula. Several illustrations of these views of the nature of imaginary quantities, occurring in logarithmic formulae and series expressing circular arcs, are given by the author. By considering all quantity as affirmative *per se*, and admitting *plus* and *minus* merely as corrective terms, we thus succeed in banishing mystery and paradox from the science most powerful in eliciting

truth, and where they ought least to find a place.

SOCIETY OF ANTIQUARIES.

ON Thursday, Henry Hallam, Esq., V.P., in the chair. The Secretary read a communication from John Gage, Esq., director, descriptive of the Bell Tower at the Abbey of St. Edmund's Bury, with a document containing some curious particulars relative to the repairs of the tower in the time of Henry VI. An account was also read of a serious insurrection which took place shortly after the dissolution of the monasteries by Henry VIII., principally instigated by the monks. Also, an account of the entry of Henry VIII. into Lincoln, drawn up by a herald of the time.

ROYAL ASIATIC SOCIETY.

SIR W. OUSELEY in the chair:—The Society of Arts, Mr. Huttman, and others, made donations to the Society. Two papers were read; the first was an account of a celebrated Arabic work, called the *Ichwan oos Suffa*, principally from the famous Syrian historian, Mar Gregorius Abul Faraj. This work is said to owe its existence to a society of seven learned Arabs, and to have formed one of at least fifty treatises on various branches of science, of which, including the present, only three now remain. It is a moral treatise, in the shape of an allegorical picture of human life. Lieut. Rowlandson communicated this essay. The second paper comprised a description of the marriage ceremonies of the Hindoos. It stated, that every man among them should have his daughter married by the time she is nine years of age; and that her marriage should, on no account, be deferred beyond her tenth year. The bridegroom should be at least three or four years older, and of the same caste. These ceremonies are conducted with more or less of magnificence, as suits the rank and means of the parties; but they frequently expend such immense sums on the marriage of their children, that the parents themselves are reduced to poverty and distress.

KING'S COLLEGE, LONDON.

WE have at various times reported progress in what concerns this interesting Institution, and have now to add to the several appointments mentioned on preceding occasions, those of N. W. Senior, Esq. to the chair of political economy; J. J. Park, Esq. English law and jurisprudence; the Rev. Henry Moseley, natural and experimental philosophy; Joseph Lowe, Esq. lectureship of commerce; the Rev. J. R. Major, A.M. head master of the High School, attached to the upper department.

ECLECTIC SOCIETY.

ON Tuesday, Dr. Uwins, V.P., in the chair. Dr. John Epps was elected Professor of Medicine to the Society. Dr. Uwins read his paper on "the poetical character, as connected with, and extending its influence over, intellectual and moral habits." It is impossible to do justice to this essay by any partial account of it. The Society's Professor of Botany, Mr. John Frost, gave his introductory lecture on that science. The meeting was numerously attended.

FINE ARTS.

NEW PUBLICATIONS.

The King's Harriers in their Kennel. Painted by R. B. Davis; drawn on stone by J. W. Giles. Dickinson.

As admirable an animal conversation as can

be imagined; and exhibiting perfect familiarity with canine character. To judge by the various and vivacious expression, the talk (with the exception of two or three abstracted philosophers, who are probably meditating on their past courses), is of the most sprightly and interesting description. As a composition, it is highly creditable to Mr. Davis; and, with regard to its execution as a print, we may, availing ourselves of a vulgar phrase, say, that there are few lithographers who can "chalk beyond it."

Alexander Morison, Esq. M.D., President of the Royal College of Physicians of Edinburgh, 1829. From a painting by J. Irvine; on stone by M. Gauci. Dickinson.

THERE is a homogeneity in the features of this calm, reflecting, benevolent countenance, which satisfies us that it is a faithful resemblance.

The Smugglers Alarmed. Painted by John Knight; drawn on stone by Thomas Fairland. Engelmann, Graf, Coindet, and Co. WE have already spoken with the praise which was its due, of Mr. Knight's exceedingly clever representation of one of those moments of agitation to which a life of lawless violence must be frequently subject. Mr. Fairland has transferred the scene to stone in a sketchy style, but with great spirit and success.

Richard Cœur de Lion and Saladin, at the Battle of Ascalon. Painted by A. Cooper, R.A.; engraved by W. Giller. Moon, Boys, and Graves.

ONE of Mr. Cooper's most animated productions. Nothing can be finer than the contrast between the characters and the modes of fighting of the English and the Saracenic monarchs; the former, perfectly erect in his saddle, his countenance breathing haughty defiance, his broad chest exposed, with no protection but the cross; his ponderous battle-axe raised aloft to the full extent of the swing of his brawny arm, and ready to descend with overwhelming force on his infidel antagonist: the latter not less brave, but more wily, conscious of his inferior strength, covering himself with his shield, endeavouring to sway his supple frame out of the reach of the stern foe, and anxiously watching for the moment when, with his keen rapier, he may successfully avail himself of his "trick of fence." The subordinate combatants, and the various incidents of the well-contested field, are also admirably represented. We do not think that mezzotint is the most suitable style of engraving for such a subject; but we cannot withhold our applause of the great force and delicacy of execution exhibited by Mr. Giller.

Hogarth Moralised; a complete Edition of all the most admired and capital Works of William Hogarth; accompanied with concise and comprehensive Explanations of their Moral Tendency, by Dr. Trusler; an Introduction, and many additional Notes. Part I. Major.

FOR us to enter into any disquisition on the merits of the great comic painter of England, especially after the admirable character of him and of the creations of his genius, which has lately appeared from the able pen of Mr. Allan Cunningham, would indeed be a work of supererogation. Although the expression, and many of the circumstances of humorous and moral illustration, in the prints of Hogarth, must necessarily be deteriorated by any considerable reduction of size; yet much of interest must

still remain; and those who are unable to procure the originals, will find even the smallest miniatures of them full of amusement and instruction. We are glad, therefore, to see the present revival of Dr. Trusler's publication, which we believe originally came forth in the year 1766. The doctor's descriptions, although occasionally rather verbose, are, upon the whole, satisfactory, and contain a great mass of elucidatory matter; to which the notes by the present editor promise to make a number of valuable additions. Several of the plates in this first part of the new publication (which is to be completed in four quarterly parts) are executed with great skill; and, with reference to them all, the wonder is, that so much of the spirit of Hogarth has been retained. To this the somewhat increased scale on which a few of the principal subjects have been engraved has contributed. We observe, from one of the notes, that it is intended, very judiciously, to prune Dr. Trusler's collection of a few subjects; among others, of the disgusting plates which represent "The Four Stages of Cruelty;" and to substitute some of Hogarth's posthumous productions.

The Pointer. Painted by M. T. Ward; the engraving commenced by J. Scott, finished by J. Webb. Moon, Boys, and Graves.

WE beg to return our personal thanks to Messrs. Moon, Boys, and Graves, for having delayed bringing out this print until the month of January. Had it appeared in September, it would have been too tantalising to us, unfortunate critics, "in populous city pent." We should have been sadly tempted to throw down our pen, and take up our Manton; to exchange our inkstand for our shooting-belt; and to transfer ourselves, as rapidly as possible, from Wellington Street to the rich stubbles of some of the inland counties. A nobler creature than this "pointer," or one more eager, and at the same time more steady in the performance of his duty, we never saw, in brake or field. The attitude is perfect; the head, body, and limbs, are finely drawn; and the general effect of the engraving (with the exception of a little want of keeping in the back ground) is masterly and striking.

POETRY.

LINES ON CANNING'S FUNERAL.

By Lord Morpeth.

[Extracted from Stapleton's Memoirs.]

I STOOD beside his tomb—no choral strain
Peal'd through the aisle, above the mourning train;

But purer, holier, seemed to rise above
The silent sorrow of a people's love.

No banner'd scroll, no trophied car was there,
No gleaming arms, no torches' murky glare—
The plain and decent homage best defined
The simple tenour of his mighty mind.

His hard-earn'd, self-acquired, enduring fame
Needs not what wealth may buy, or birth may claim;

His worth, his deeds, no storied urns confine—
The page of England's glory is their shrine.

Are others wanting? Mark the dawn of peace
That gilds the struggle of regenerate Greece—
On Lisbon's heights see Britain's flag unfurl'd,
See freedom bursting o'er an infant world!

Ask ye how some have loved, how all revere?
Survey the group that bend around his bier;
Read well the heaving breast, the stifled moan,
—Kings, with their kingdoms, could not win
that groan!

DRAMA.

OLYMPIC THEATRE.

HAVING previously appeared in public at Vauxhall, and made the tour of the provinces, this week has been produced as an Olympic novelty, *The Chaste Salute*, of Mr. Planché; with this, Madame Vestris has nothing to do. Indeed, however great may be the exertions of which that lady is capable, or however it might conduce to the gratification of her admirers, it is too much to expect her to undergo the fatigue of four pieces every night. With regard to the burletta, we have only to remark that it furnished the means of introducing M. Spagnoletti to the public; but so deplorably was his part obliterated from his memory, as grievously to destroy the effect of the piece, and totally that of his *début*. A very clever little girl, a Miss Sidney, also made her first appearance and a far more favourable impression. She promises fair, and may, some of these days, attain a far higher degree of excellence; and is undoubtedly a great acquisition to the *corps dramatique*. Another new piece, *The Lost Son*, made its first essay; the success of which was insured by "putting the best Foot foremost."

VARIETIES.

Geological Memoirs.—Privy Counsellor Dr. Karsten, of Berlin, has begun a new series of his very valuable *Archiv für Bergbau und Hüttenwesen*, under the title *Archiv für Mineralogie, Geognosie, Bergbau und Hüttenkunde*, or Archives of Mineralogy, Geology, Mining, and Metallurgy. The first Number contains, besides many other valuable papers, a geological description of the islands of Skye and Eigg.

Henry Mackenzie.—We have only room to say in this *Gazette*, that Henry Mackenzie, Esq., the venerable author of the *Man of Feeling*, died last week in Edinburgh, in his 86th year.

Greek Antiquities in India.—The Chevalier Ventura, formerly in the French army, and now a general in the service of Runjeet Singh, was encamped, in April last, near Manekiala, or Manicayala, where there are the ruins of a large city. The place is seventy-two miles east of the Indus, and thirty or forty west of the Jhyum or Hydaspes, in lat. 33° 23' north, and long. 73° 15' east. In Elphinstone's *Cabul*, the very remarkable stone cupola, on the top of a solid mound, which is believed by the natives to have been built by the gods, is described as bearing a much greater resemblance to Greek than to Hindoo architecture. General Ventura made an opening into the cupola, and, on digging three feet, he found six medals; and afterwards the workmen came to a chamber of hewn stone, twelve feet square. The excavation was continued to the depth of thirty-six feet, and another opening was afterwards made in the north side of the cupola, and more than eighty medals were found. Most of them were copper, but some were gold and silver. There were also other curiosities, rings, and boxes containing liquids. We understand that the chevalier intends to transmit an account of his prize-worthy labours and discoveries to the Asiatic Society. Perhaps this may be the site of some of the cities that were founded by Alexander or Seleucus in the dominions of Taxiles.—*Bengal Hurkaru*.

Asbestos.—In a communication recently made to the French Academy by M. Aldini, with reference to his fire-proof dresses, he states that some experiments, which have been made at Milan, seem to shew that gar-

ments, composed of asbestos, will supersede the necessity of metallic dresses. A manufactory for asbestos cloth has already been established at Vallegine; and a paper-maker has it in contemplation to employ it instead of cotton or linen in the fabrication of paper intended for theatrical scenery. Asbestos may be easily imported from Corsica, where it is found in great plenty, and of excellent quality. It exists also in several other countries of Europe, in which no use is at present made of it.

The Figurative.—Mr. O'Connell, in a letter to the people of Ireland, of the 14th, tells them "that Lord Anglesey carries on the political warfare more in the fashion of the savages of New Zealand than in the modes adopted by civilised nations." Who would have thought this, considering that the lord lieutenant had carried it on by proclamations; and in one case, by the interference of two police magistrates, proceeding under an act of parliament!!!

Mean Temperature of Twenty-eight different Places in the State of New York.

In 1826, the mean temperature of ten places was	43.4
1828, the mean temp. of twenty-three places was	49.60
1829, the mean temp. of twenty-eight places was	46.45
Inches.	
In 1826, the mean rain of nine places was	36.34
1828, the mean rain of twenty-five places was	36.74
1829, the mean rain of twenty-five places was	54.38
Mean	35.96

We ought to remark, that though not entrusted under our scientific head (in which we principally look to insert original matter), such varieties as this are of much importance to the physiologist.

Connexion of hard Water and Beer.—Hard water is found in many instances favourable to the manufacture of beer; the Barnstaple and Liverpool ales, which are considered excellent in quality, and some others, are brewed with hard water. The Derby malt, which is much used in Lancashire, is found to make better beer in that county than in Derbyshire; and it may be supposed that the Lancashire water, which generally contains much carbonate and sulphate of lime, occasions the difference. The river Trent has long been celebrated for the excellence of the ale made from its water; Burton, Nottingham, and the other towns which lie upon it, being famous for their malt liquor all over England. The river Trent is well known to run over calcareous strata in its course. The same brewer cannot, with the same malt, produce an equal beer in any other part of the kingdom.

Antiquities.—In making excavations at Turin, for the purpose of erecting some new houses in the square Emmanuel-Philibert, an ancient and pretty extensive edifice has been discovered,—elegant, and magnificently ornamented, and of which there is nothing to indicate the original destination. The pavement is composed of slabs of the finest marble, skilfully united. Two tumular stones announce, by the two inscriptions which are engraved upon them, that Scudo had prepared one of these tombs for himself, and the other for his wife Cristes. These names, and the shape of the letters of the inscription, characterise the second century of the Christian era. A great number of medals have also been found: the oldest are of the date of the Emperor Constantine. But what is much more important for archaeology and architecture, is the discovery of the foundations of the walls which formed the boundary of Turin in the ninth century. The quality of the materials, and the mode of construction, are similar to those of the ancient palatine port, now Tours (*le Torri*). This monument, due no doubt to the Lombard

dukes, who resided at Turin from the seventh to the eighth centuries, is the finest ruin which remains in Italy, or in Europe, of the profane architecture of that period, when the art, then in its decay, knew no other law than a capricious license.—*Gazette Piemontaise*.

Singular Phenomenon.—Before the Artesian wells were in use, the inhabitants of Thairi, in Savoy, wishing to procure water, dug, in 1825, a well in that commune. They could not find a sufficiently abundant source for their wants; but in default of water, this well, by a curious singularity, exhibits all the variations of the atmosphere, and almost obviates the necessity of a barometer to indicate the weather. If the vicinity of Thairi is menaced with hail or snow, an impetuous wind rushes from it like a torrent, which carries with it stones and pieces of rock, and the wind lasts as long as the snow or hail is likely to fall, and indicates the quantity. When this wind ceases after a slight breeze, a south-east wind is about to manifest itself. When the wind rushes from it suddenly, in a single gust and with violence, it indicates an approaching storm. When the weather is fine, and the north wind dominates, the well is tranquil, and the air is in a state of stagnation. Several naturalists, attracted by these marvellous effects, have sought to explain the cause of them; and the academical bodies and the men of science of Turin, Chamberri, and Grenoble, have visited the spot, and, by various experiments, established the fact that the well possesses the properties here attributed to it.—*La Voleur*.

Direction of the Diluvial Waters in the Shetland Islands.—From an inspection of the mass of clay and transported boulders, which lie dispersed over the Shetland islands, Dr. Hibbert has given it as his opinion, that the great currents which deluged the British islands, as well as some parts of the continent, had, in these islands, a north-easterly origin, or a south-westerly direction. Our notions of the geological deluge, as connected with the upraising of mountain chains, would lead us to a very different system of research, and a much more extended inquiry, than that which has been pursued by the learned author in this otherwise curious generalisation.

New Species of Natural not Oxydized Combinations of Antimony and Arsenic.—Professor Henry Rose, of Berlin, in the 15th vol. of Pogendorf's *Annalen der Physik und Chemie*, has given the analysis of several minerals as belonging to this class of substances. Tinkenite, from the Walfaberg, in the eastern Harz; Miargyrite, or the hemiprismatic rubyblende of Mohs, from Braunsdorff, in Saxony; Jamesonite, from Cornwall; plumose, gray antimony (*federerz*), from Wolfsberg, in the eastern Harz, in capillary crystals; red silver, a light variety from Ivachimethal in Bohemia; brittle silver glance, from Shernitz, in Hungary, crystallised in six-sided prisms; bournonite, from the Pfaffenberg mine, in the eastern Harz; polyenesite, a new species, from Guarismagey, in Mexico, and Morgenstein, in Saxony; gray copper, or fahlerz, from the mines of Alsace, Freiberg, Hungary, Nassau, Clausthal, &c.; and lastly, nickeliferous, gray antimony.

LITERARY NOVELTIES.

[*Literary Gazette* Weekly Advertisement, No. IV. Jan. 22.]

A Panorama of Constantinople and its Environs, from Sketches taken on the spot by J. Pitman, Esq.—A Topographical and Statistical Description of the British Dominions in North America, including Observations on Land-granting and Emigration, &c., by Colonel Bouchette.—Leigh's Guide for Travellers through Wales and Mon-

mouthshire, with Map, &c.—The Siege of Constantinople, a Poem, in three Cantos, by Nicholas Michell.—The Anti-Materialist, or a Manual for Youth, by the Rev. R. Warner, F.S.A. &c. author of "Literary Recollections," &c. &c.—*Partis I. and II.* of a Translation from the German, of the Anatomical Atlas of Dr. M. J. Weber, Professor at Bonn.—The Welsh Interpreter, containing a concise Vocabulary and useful Phrases, on the plan of Blagdon's French Interpreter, by Mr. Roberts, of Llwynrhuddol.—Framlingham, a Narrative of the Castle, Historical and Descriptive; a Poem, by James Bird, author of "the Vale of Sloughden," &c. &c.—Examples in Algebra, by the Rev. W. Foster, M.A.—A Refutation of Mr. Palgrave's Remarks on the Observations on the State of Historical Literature; together with additional Facts relative to the Record Commission and the Record Offices, by Nicholas Harris Nicolas.—The Privy Purse Expenses of Elizabeth of York, and the Wardrobe Accounts of Edward the Fourth, with original Memoir of Elizabeth of York, by the Same.—A Help to Professing Christians, by the Rev. John Barr.—Mr. Payne, author of "an Exposition of Jacotot's System," has in the press the *Epitome Historiæ Sacre*, adapted by a literal English Translation, &c. to Jacotot's method of instruction; and also a Manual for those who wish either to teach or learn Latin by this plan. Appare, or the Sacred Love-pledge, by Mrs. Lachlan.—The following is a list of the contents of the forthcoming Number of the Quarterly Review:—The Political Economists—Mr. Southey's Lives of Uneducated Poets—Dymond on the Principles of Morality—Origin of the Homeric Poems—Moore's Life of Byron—the Military and Mob of Paris—Present State of the Country.

METEOROLOGICAL JOURNAL, 1831.

January.	Thermometer.		Barometer.
	From	To	
Thursday 13	30.	38.	30.02 to 30.04
Friday 14	30.	40.	30.08 Stationary
Saturday 15	29.	33.	29.94 — 29.92
Sunday 16	27.	34.	29.76 — 29.73
Monday 17	30.	43.	29.59 — 29.54
Tuesday 18	31.	46.	29.52 — 29.56
Wednesday 19	33.	47.	29.59 — 29.61

Wind variable, S.E. prevailing. Except the evening of the 17th and morning of the 18th, overcast with rain at times.

Rain fallen, .275 of an inch.

CHARLES H. ADAMS.

Latitude..... 51° 37' 33" N.
Longitude.... 0 3 51 W. of Greenwich.

Extracts from a Meteorological Register kept at High Wycombe, Bucks, by a Member of the London Meteorological Society. December 1830.

Thermometer—Highest	46.00°
Lowest	9.75
Mean	32.54032
Barometer—Highest	30.19
Lowest	29.65
Mean	29.93784

Number of days of rain or snow, 13.
Quantity of rain and melted snow in inches and decimals, 1.695.

Winds.—7 East—4 West—1 North—0 South—6 North-east—1 South-east—5 South-west—7 North-west.

General Observations.—The mean of the barometer was lower than any one in December during the journalist's residence in High Wycombe, and the range of the thermometer greater than in the same month for the last eight years; while the mean was lower, excepting in the last year, than any in the corresponding month for the same period: of the quantity of rain and melted snow the like report must be made as of the mean of the thermometer. Snow fell on the 12th, 15th, 22d, 24th, and 27th—the whole quantity not more than 2½ inches. On the night of the 11th a beautiful aurora borealis was seen for several hours: about 1 A.M. on the following morning it assumed the form of a brilliant arch, surmounted by a brown tint, which faded away into a silvery light, something resembling that afforded by the moon before she appears above the horizon—a deeper brown colour filled up the space beneath the luminous arch. Another, but very faint, aurora was observed on the 15th. Lunar halos seen on the nights of the 23d, 24th, and 26th—that on the latter night was remarkably bright, and well defined. The evaporation 0.0625 of an inch.

TO CORRESPONDENTS.

To our respectable correspondent at Norwich we beg to say, that it is hardly our province to correct the blunders of any of our contemporaries. We are surprised that he expected any thing else in the quarter alluded to. The tissue of absurdity and error purporting to be a sketch of Cardinal Wulfi, is below notice.

M. N. will find a letter at our Office.
We can have nothing to say to K's lines to Henri.
ERRATUM.—In our account of Mr. Deville's lecture at the Society of Arts last week, p. 41, col. 1, third line from bottom, for "posted," read "frosted."

ADVERTISEMENTS,

Connected with Literature and the Arts.

Suffolk Street Gallery, Pall Mall East.

SOCIETY OF BRITISH ARTISTS.

Notice to Exhibitors. All Works of Art intended for the coming Exhibition must be sent on Monday the 7th and Tuesday the 8th of March, between the Hours of Ten in the Morning and Five in the Evening.

JOHN WILSON, Secretary.

UNIVERSITY OF LONDON.

The Council hereby give Notice, that Alexander Blair, LL.D. Professor of English Philology, Rhetoric, and English Literature, will commence his Course of Rhetoric, on Monday the 9th of January, at Half-past Seven in the Evening, and will be continued on Mondays and Thursdays, at the same Hour.

A Lecture will be delivered every Monday, Wednesday, and Friday, at the same Hour, to the end of the Session.

Dr. Lardner's Popular Course of Eighteen Lectures, on Mechanics and Hydrostatics, will commence on Monday the 9th of January, at Half-past Seven in the Evening, and will be continued on Mondays and Thursdays, at the same Hour.

The Annual Course of Lectures on Political Economy, by Professor Maculloch, will commence on Wednesday the 8th of February, at Half-past Ten o'clock, and will be continued every Monday, Wednesday, Friday, and Saturday, at the same Hour to the end of the Session.

For further Particulars apply at the Office of the University, 18th January, 1831. LEONARD HORNER, Warden.

N.B. The London University Calendar, published by Mr. Taylor, No. 30, Upper Gower Street, and by all other booksellers, contains a full and complete account of each Professor's Course of Lectures, and of the whole plan of the University.

TO SCHOOLMASTERS.—A Lady, who

conducts an Establishment for a limited number of Young Ladies of the first respectability, is desirous of exchanging one or two of her Sons with a Gentleman for one or more of his Daughters, upon Terms of mutual advantage. The most unexceptionable References will be given and required.

Letters (post-paid) containing real name and address, directed to R. A. Mr. Joyce's Library, Southampton, will meet with immediate attention.

To Booksellers and Publishers.

SWITZERLAND.—To be disposed of, a Series of Sketches in Switzerland and of the Italian Lakes.

Address (post-paid) A. Z., Mr. Farrer's, Cabinet-maker, 86, Curtain Road.

In atlas 4to. price 2s. 10s.; Proofs 3s. 6s.

A SERIES OF SUBJECTS from the WORKS of the late R. B. BONINGTON.

Drawn and etched by J. D. HARDING.

"Alas, for Bonington! your presage has been fatally verified—the last duties have been paid to him this day. Except in the case of Mr. Harlowe, I have never known, in my own time, the early death of talent so promising and so rapidly and obviously improving."—Extract from a Letter written by Sir Thomas Lawrence.

London: Printed for James Carpenter and Son, Old Bond Street.

THE COURT JOURNAL, and Gazette of the Fashionable World.

The distinguished success which has attended this publication from its commencement, is a proof how great was the necessity for some adequate and exclusive channel for the communication of intelligence regarding the movements, manners, and feelings, of the higher classes of society.

The commencement of a new reign, under the happiest auspices, and the institution of a new and perfectly organised court, are circumstances which must materially heighten the general interest attached to the proceedings of Royal and Noble, and the brilliant circle connected with them. This favourable conjuncture of circumstances will afford great additional scope to the Court Journal; and no efforts will be spared to extend its utility, and increase its claims to public favour.

This interesting new weekly Journal, containing forty-eight columns, is printed on a handsome 4to. stamped sheet, so that subscribers may receive and transmit it to their friends (postage free) throughout all parts of the United Kingdom; and, if sent by the morning coaches, it may be received in all parts of the country twelve hours after its date. It is sent weekly by express.

Printed for Henry Colburn, and published every Saturday morning by W. Thomas, at the Office, 19, Catherine Street, Strand, and regularly supplied by the Booksellers and Newsmen throughout all parts of the United Kingdom.

THE UNITED SERVICE JOURNAL.

The distinguished favour with which this Periodical has been received is abundant, not only by the two Services to which it is more immediately addressed, but by the public in general, is not a little gratifying to the Proprietors, inasmuch as they consider it a proof that the execution of the work has met with general approbation. Assuredly every true lover of his country, in pursuing the details of operations that led to the triumphs of Nelson and of Wellington—in reading narratives of individual heroism and suffering—in participating, as it were, in the exploits of our gallant soldiers and sailors in every quarter of the globe—in short, in tracing the progress of those events which have conferred such lustre on the British name—must feel a deep and anxious interest. But in securing to their Journal the various advantages it has hitherto possessed, the proprietors have made considerable sacrifices by having repeatedly exceeded the proper limits, without, however, being able to do full justice to their numerous and valuable contributions. Under these circumstances, they have determined to enlarge the plan and price of their Work to the same extent as those of the New Monthly Magazine; so that, like that popular periodical, each year of the United Service Journal will in future consist of three volumes. By these means they trust they shall be enabled to render the Journal still more worthy of public favour, so they shall thus obtain space for many additional valuable communications, and be enabled to open new and important channels of information both at home and abroad.

Printed for Henry Colburn and Richard Bentley, New Burlington Street, and by every Bookseller and News-vender throughout the Kingdom.

N.B. Those who desire to avail themselves of the favourable opportunity of the new year for commencing the Work, are requested to send their orders forthwith to any Bookseller or News-vender in their own immediate neighbourhood.

TO SCHOOLMASTERS.—A Young Man competent to teach the Latin and Greek Languages, and the general routine of Education, wishes to obtain a Situation in a School.

Inquire (if by letter, post-paid) of Surnborne and Co. Bookellers, Colchester.

DAILY INSTRUCTION.—A LADY,

who has been regularly educated, wishes to devote a portion of her time to the instruction of Pupils at their own Residences, in English, French, Geography, History, Music, and Drawing, with Writing and Arithmetic. Distance must not exceed Two Miles from Kennington Cross.

Unexceptionable references will be given, on application to the Publisher.

SLATE GLOBES.—The Inventor begs

leave to draw the attention of those engaged in teaching, to these Globes, as being eminently calculated for Geographical and Astronomical exercises, possessing very superior advantages; as from their Globular form, a more correct idea of the relative situation of countries, &c. is to be attained, than is possible from a plane surface. The Parallels and Meridians are permanently drawn. The surface is precisely similar to slate, and is marked on with the common slate-pencil.

Price, 10 inches diameter, 1l. 1s.; 12 inches, 1l. 10s.

on neat Mahogany Stands.

Sold by C. Smith and Son, 174, Strand.

BOOKS PUBLISHED THIS DAY.

Compiler of the "Clergyman's Almanac, and the "Liber Sclavasticus."

Printed for C., J., G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

In 1 large vol. 8vo. price 16s. In boards, the 8d edition, enlarged, (entirely re-written,) of

THE DIFFICULTIES of ROMANISM in respect to Evidence; or, the Peculiarities of the Latin Church evinced to be untenable on the Principles of legitimate Historical Testimony.

By GEORGE STANLEY FABER, B.D.

Rector of Long Newnham, and Prebendary of Salisbury. Printed for C., J., G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

Of whom may be had, by the same Author,

1. A Supplement to the above Work; being an Answer to the Bishop of Strasburg. 8vo. 6s.

Also,

2. The Sacred Calendar of Prophecy. 3 vols. 8vo. 1l. 16s.

And all his other Works.

In 8vo. price 10s. 6d. in boards.

OBSERVATIONS on the HISTORY of the PREPARATION for the GOSPEL, and its early Propagation, from the Destruction of Solomon's Temple, to the end of the First Christian Century.

By the Rev. J. COLLINSON, M.A.

Rector of Gateshead, Durham. Printed for C., J., G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

New Volumes of Sermons by the late Mr. Jones, of Nayland.

In 3 vols. 8vo. price 1l. 1s. in boards.

SERMONS on VARIOUS SUBJECTS

and OCCASIONS.

By the Rev. WILLIAM JONES, A.M. F.R.S.

Late Minister of Nayland.

Now first published from the Original MSS. Edited by the Rev. WILLIAM HENRY WALKER, A.M. Fellow of Queen's College, Cambridge, and Chaplain to St. George's Hospital.

Printed for C., J., G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

Of whom may be had,

Mr. Jones's Theological and Miscellaneous Works, in 6 vols. 8vo. with a Portrait, 2l. 2s. in boards.

The Cheapest Literary Periodical.

THE CASKET, published every Saturday, price only One Penny, consisting of Eight closely printed 8vo. pages, with fine Wood Engravings, from original Designs, has now been Four Years established.

No. 288 (for Jan. 1, 1831, being the first No. of Vol. V.) contains an Engraving of a Military Execution, with a Tale by John Shipp—Last illness and Death of Lord Byron—Indian Religion—First English Colony in America—Gallantry of Catharine of Russia—"I'm not a Single Man," a humorous Poem by T. Hood, Esq.—Drama; the Pantomimes—Facts in Science—Varieties, &c. &c.

Vols. I. to IV. of the Casket, each containing above Fifty Embellishments, &c. each, in boards.

Published by James Wilson, 60, Paternoster Row; and to be had of all Vendors of Periodicals.

Price 3s. 6d.

THE CHAMPION OF CYRUS; a Drama,

in Five Acts.

By LUKE BOOKER, LL.D. F.R.S.L. &c.

Published by W. Nimplin and R. Marshall, Stationers' Hall Court, London.

Dedicated, with permission, to Professor Gaisford.

SCRIPTORES GRECI MINORES,

quorum reliquis, fere omnium mellioris notæ, ex editionibus variis excerptis J. A. GILLES, A.B. & C.C.C. Oxon. Beautifully printed in 2 vols. foolscap 8vo. cloth boards, 16s.

This publication comprises a full and complete collection of as many of the minor Greek authors as could be brought together in a convenient form at a moderate expense. It contains the whole remains of fifty authors. Great care has been taken with the printing, and some hundred attempts have been made at restoring passages evidently corrupt. Whoever wishes to have his classical library complete, will not be without this work; and he would find any other edition of Sappho or Tyrtaeus alone cost him more than the whole of the fifty authors here collected together.

The following may be had separately:—

1. The Greek Poetesses: Anyta, Hedyle, Erinna, Theocrita, Corinna, Melanoe, Myro, Nossis, Praxilla, Sappho, and Telesilla. Stitched, 2s. 6d.

2. Alceus, Stesichorus, Sophron, Tyrtaeus, Solon, Mimnermus, and Archilochus. Stitched, 2s.

3. Simnias Rhod., Simnias Theb., Pythagoras, Simocritus, Musaeus, Phylarchides Miles, Phocylides Alex., Alcman, and Rhapsanus. Stitched, 2s.

4. Containing Agatho, Archytas, Bacchylides, Coluthus, Euryphamus, Heliodorus, Hippomachus, Ibycus, Ion Chius, Melissa, Myla, Naumachus, Pittacus Mitylenæus, Theano, Tryphiodorus, Tzetzes, and Xenophanes. 1 vol. cloth boards, 2s.

Oxford, D. A. Talboys; Whittaker, Treacher, and Co. London.

Abridged into English for Schools and Colleges, and printed by A. J. Valpy, M.A.

VIGER on the IDIOMS of the GREEK

LANGUAGE, translated into English, and abridged for the Use of Schools and Colleges. 8vo. 9s. 6d. boards.

By the Rev. J. SEAGER.

Author of "Critical Observations on Classic Authors," and "Greek Criticisms in the Classical Journal."

"This volume is compiled with much industry and judgment; and altogether a more valuable service could not well have been rendered to the inquiring student of the classics."—*Oxford Literary Gazette*.

"But when they have made real advances in Greek prose, read over with them the whole of Viger's, Mr. Seager's, what I may call a summary of the most useful parts of education. You should make them read Viger's in this way twice every year, for five, six, or seven years."—*Dr. Parr*. See Johnston's "Life of Parr."

2. Hoogveen on the Greek Particles, on the same plan as Viger. By the Same. 8vo. 7s. 6d. boards.

"Hoogveen has always been considered a valuable aid in the study of Greek; and Mr. Seager has compressed and translated in a manner which we could not desire to be better."—*Spectator*.

3. Bos on the Greek Ellipses, on the same plan as Viger. By the Same. 8vo. 8s. 6d. boards.

"The defects of preceding editors it has been the object to remedy; and in bringing back the book into some two hundred pages, he has retained the essence of all that is beneficial, while he has placed it more easily within reach by the order into which it is reduced."—*Literary Gazette*.

"Mr. Seager has shown good taste in abridging considerably, by the exclusion of all repetitions and irrelevant matter. He has reduced the examples under each word into nearly an alphabetical arrangement, facilitating the student's inquiries, and also not joined a number of excellent notes. In short, he has no hesitation in recommending this book to the teachers of Greek, as the best dictionary of elliptical expressions."—*Edinburgh Literary Journal*.

4. Hermann's Elements of the Doctrine of Metres, on the same plan. By the Same. 8vo. 8s. 6d. boards.

5. Maittaire is under abridgement, and, when complete, the Five Works may be purchased separately, or in 2 vols. 8vo. (Maittaire will be published on the 15th Feb.)

3d edition, with improvements, price 2l. 5s. in 3 vols. 8vo.

GREEK TESTAMENT, with English

Notes. Containing copious Critical, Philological, and Explanatory Notes; with Parallel Passages, &c. from the Classics, and with References to Viger's for Idioms, and Bos for Ellipses. To which is prefixed a short Treatise on the Greek Article, according to Bishop Middleton, Mr. G. Sharpe, &c., briefly explained, as applicable to the criticism of the New Testament. The various Readings and Parallel References are recorded under the Text. Greek and English Indices are added. Two plates are added, one illustrative of the "Travels of the Apostles," and the other a "Map of Judea, and a Plan of the City and Temple of Jerusalem."

By the Rev. E. VALPY, B.D.

This work is intended for the Use of Students in Divinity, as well as for the Library.

"After a minute examination, the author of the present manual considers this Greek Testament the most valuable that has yet been published with critical and philological apparatus; especially for students who wish only one edition of the Greek Testament."—*Edinburgh Review*.

"The young divine will find in this work not only a safe guide in his studies, but the best which he can obtain within the compass of the same price and size."—*Classical Journal*, No. 77.

Also, 2ls. boards.

Greek Septuagint, with the Apocrypha.

Edited by A. J. Valpy, from the Oxford edition of Bos and Holmes. 8d edition.

This edition is printed in a cheap form for Schools, in 1 vol. 8vo.; for use in Churches and Chapels as well as the Library.

"This elegantly executed volume is very correctly printed, and (which cannot but recommend it to students in preference to the incorrect Cambridge and Amsterdam reprints of the Vatican text) its price is so reasonable as to place it within the reach of all who desire a *facile introduction to the Bible*."

* * * The Septuagint and Testament may be had uniformly bound in 4 vols.

Sold by Longman; Baldwin; Whittaker; Rivington; and all Booksellers in Town and Country.

Crabb's Dictionary of General Knowledge.
3d edition, in 1 large vol. duodecimo, embellished with 320 Cuts, price 6s. boards, or 15s. in morocco.

A DICTIONARY OF GENERAL KNOWLEDGE; or, an Explanation of Words and Things connected with the Arts and Sciences.
By GEORGE CRABB, A.M.
The 3d edition, corrected and enlarged.

Literary Presents.
FAMILY LIBRARY.
"Books that you may carry to the fire, and held readily in your hand, are the most useful, after all. A man need not look at them, and be tempted to go on, when he could have been frightened at books of a larger size and of a more erudite appearance."—*Dr. Johnson.*
"Mr. Murray's Library.... A very excellent, and always entertaining Miscellany."—*Edinburgh Review*, No. 103.
"La collection que fait paraître M. Murray, sous le titre de Bibliothèque de Famille, devient de jour en jour plus populaire, et justifie pleinement son succès, par le choix des sujets, les noms des auteurs, et la foule de documents curieux, de faits ignorés, de remarques neuves, qui rassemblent les volumes déjà publiés."—*Revue Encyclopédique.*
"Eine vortreffliche sammlung von Volksbüchern."—*Norgerblatt.*

Volumes of the Family Library published up to this time.
Price 5s. each, profusely illustrated, and neatly bound in canvas.

Nos. I. and II. The Life of Napoleon Buonaparte. With Fifteen Engravings on Steel and Wood, by Flindin and Thompson; the Woodcuts from Designs of George Cruikshank.

No. III. The Life of Alexander the Great. (Classical Series, No. I.)

Nos. IV. X. and XIII. Lives of the most Eminent British Painters, Sculptors, and Architects. Vols. I. II. and III.

Nos. V. VI. and IX. The History of the Jews. Complete in 3 vols. with original Maps and Woodcuts.

No. VII. The Natural History of Insects, with very numerous Woodcuts.

No. VIII. The Court and Camp of Buonaparte. 1 vol.

No. XI. The Life and Voyages of Christopher Columbus. By Washington Irving. Abridged by him from his larger Work. Complete in 1 vol.

No. XII. The Life of Nelson. By Robert Southey, Esq., LL.D. Complete in 1 vol. Embellished with numerous Woodcuts from Designs by George Cruikshank, engraved by Thompson and Williams.

John Murray, Albemarle Street.

MOORE'S LIFE OF BYRON, complete in 3 vols. 4to. with beautiful Portrait.

2. The Life and Correspondence of Admiral Rodney. Edited by his Son-in-law, Major General Mundy. With a Portrait, 3 vols. 8vo. 3s. 6d. Dedicated, by permission, to his Majesty.

"To the lover of history, to the nautical student, to the statesman, and to the tactician, this work will be equally valuable. The correspondence is most interesting. It brings before us many national events and celebrated characters, with all the distinctness of a yesterday's narrative. These volumes have afforded us unlimited pleasure, and the hero of them, who was also that of a most animated antiquary by his present Majesty, deserves to be better known."—*Sunday Times.*

3. Adventures of Giovanni Finati, in various Countries of the East. Edited by William John Bankes, Esq. 3 vols. fols. 8vo. 14s.
"It is long since we have met with so eventful and interesting a narrative."—*Literary Gazette.*

4. On the Progress of Society. By Dr. Hamilton, of Aberdeen. Author of "An Essay on the National Debt." Crown 8vo. 10s. 6d.

5. Causes of the Failure of the Military at Paris. By an Officer of the French Guards. 2d edition. 8vo. 2s. 6d.
"An accurate and remarkably candid relation of those events."—*United Service Journal.*

"Decidedly the most interesting document that has hitherto been published, upon those celebrated Three Days which overturned a throne, and changed a dynasty. It ought to form part of the library of every man who wishes to know and preserve the history of the time in which he lives."—*Blackwood's Magazine*, January, 1831.

6. A German Grammar, on a New Principle, calculated to facilitate the acquirement of the Language by the English Student. By Dr. Becker. 8vo. 8s. 6d.

7. Three Lectures on Wages, and on the Effects of Absenteeism, Machinery, and War; with a Preface on the Causes and Remedies of the Present Disturbances; delivered before the University of Oxford in Easter Term 1830. By Nassau W. Senior, Magd. Coll. A.M. late Professor of Political Economy. 2d edition. 8vo. 1s.

8. Family Library, No. XVIII. The Voyages and Adventures of the Companions of Columbus. By the Author of the "Sketch Book."
John Murray, Albemarle Street.

National Songs and Airs.
Price 10s. 6d. beautifully done up in De la Rue and Co.'s Arabesque binding.

BRITISH MELODIES; or, Songs of the People.

By T. H. CORNHILL.
"We have much pleasure in recommending this beautiful little volume to the attention of our readers. Mr. Cornhill is a poet of no mean order, and what is better, he is a true, ardent, and sincere friend to his country, and a warm advocate of liberty; at the same time that he is unshackled by the trammels of party."—*Standard Rev.*

"These are 122 melodies, most of them admirably adapted for music, and in troublesome times many of them might take the place of the soul-stirring national songs of Ethiopia, which inspired the peasant with the desire of rivaling a Nelson or a Wellington. Should such times again occur (and they seem not far from us), many of these melodies, we hope, will be published in a popular form, when they certainly will also become national favourites."—*Glasgow Herald.*
Smith, Elder, and Co. 65, Cornhill.

New Novels by distinguished Writers.
Just published by Henry Colburn and Richard Bentley, New Burlington Street, in 2 vols. post 8vo.

THE OXONIANS; or, a New Glimpse at Society.

By the Author of "the Roud."
"This novel bounds in and is full of the most laughable and whimsical situations, and cannot fail to amuse every class of readers, while the portraits drawn by the author are recognised by every one at all conversant with 'Life in London.'"—*Evening Paper.*

Southernman; or, a Tale of the Reign of Queen Mary. By John Galt, Esq. Author of "Lawrie Todd," "the Life of Byron," &c. In 3 vols. post 8vo.

"A tale of great and varied interest."—*Court Journal.*
"The period of the reign of Mary Queen of Scots is rich in materials for the novelist. The fortunes of Chasteler—the life and loves of Darnley—the history of Morton and the conspirators—the strange story of the Italian musician—are all replete with interest of the highest order."—*Athen.*

Walter Colyton; or, a Tale of the Reign of James II. By the Author of "Brambletye House," "the New Forest," &c. &c. In 3 vols. post 8vo.

"The principal characters in this work consist of the Prince of Orange; Mary, the daughter of James; one of the Sydney's; Sir Charles Sedley, and his daughter the Countess of Dorchester; Charles Jeffreys, and other ruling spirits of that day. A period more pregnant with events and absorbing interest, both as to character, incident, and national importance, could not possibly have been chosen."—*Courier.*

The Denounced. By the distinguished Author of "Tales of the O'Hara Family," "the Novians," &c. In 2 vols. post 8vo.

"Mr. Banim is well entitled to rank among the foremost of our modern writers. Every character he is connected with that all-powerful mover of the heart and passions—religion. Under this great agency, more strange and romantic deeds have been achieved, and more startling events have arisen, than were ever excited even by revenge, ambition, or love."—*Globe.*

The English at Home. By the Author of "the English in Italy," "the English in France," &c. In 2 vols. post 8vo.

"This work presents, in a series of tales, a picture of the private life of the great of our day. There will be no difficulty in recognising many of the political and fashionable portraits."—*Globe.*

London: Printed for Thomas Tegg, 78, Chesham; R. Griffin and Co. Glasgow; and J. Cumming, Dublin.

Dr. Barrow.—Price 1s. 6d.

DIVINES OF THE CHURCH OF ENGLAND, No. VIII., being the Third Volume of the Works of Dr. Barrow (in which will be introduced several unpublished Sermons), with a Life, a Summary to each Discourse, Notes, &c.

By the Rev. T. S. HUGHES, B.D.
It was the advice of Lord Chatham to his illustrious son, to study the works of this eminent divine deeply and frequently; and it was the remark of the celebrated Bishop Warburton, that in reading Barrow he was obliged to think.

Nos. I. to V. contain the only uniform and complete edition of the Works of Bishop Sherlock. Price 11s. 12s. 6d.

To be continued in Monthly Volumes, in a cheap and commodious size, averaging 500 pages, price 7s. 6d. and printed by A. J. Valpy, M.A. Red Lion Court, where Subscribers' Names for a part or the whole of the Series are received, as well as by all Booksellers in Town and Country.

An Argument or concise Summary of Contents will be prefixed to every Sermon, Tract, or Disquisition; so that not only direct access may be had to any portion required for perusal, but the Summary may be considered as a skilful hand calculated to assist the young Divine in composition.

After Harrow will follow the most popular Works of Jeremy Taylor, Hall, Jewell, Seod, Jortin, South, Hurd, Beveridge, Paley, &c.

The Series will not exceed Fifty Volumes; but any Author may be had separately, as a part of the Series.

"This desirable and highly useful publication we pronounce to be among the best executed and cheapest periodicals of the British press; we consider it not only a work of infinite instruction to the unprofessional reader, but calculated to promote religion to its most extensive extent."—*The Athen.*

May 1899.

In 1 vol. post 8vo. 6s. cloth boards,
BEAUTIES OF THE MIND; a Poetical Sketch: with Lays, Historical and Romantic.
 By CHARLES SWAIN.
 London: Published by W. Simpkin and R. Marshall, Stationers' Hall Court, Ludgate Street.

Of whom may be had, by the same Author,
Metrical Essays on Subjects of History and Imagination. 18mo. 6s. boards.

Mr. Swain possesses one of those minds which, poetical in themselves, imbue all they touch with poetry. A poet's eye sheds its own colouring around; and the passing thought, the slight hint, are developed into beauty by the light of his words. Mr. Swain is especially happy in his historical illustrations; his descriptions are as rich as the moral he deduces is touching—the links human feeling and human pomp well together. The first poem had best be read as a whole harmonious chain of thought. Out of the very beautiful minor poems we select two favourites. We have only to repeat, that we submit this volume much; it has grace, truth, and tenderness, told in music; and we cannot dwell on its page without experiencing a feeling of liking and respect towards the author."—*Literary Gazette.*

7th edition, 8vo. 2s.
FAZIO; a Tragedy.
 By the Rev. H. H. MILMAN.

As now performing at the Theatre Royal Covent Garden.
 John Murray, Albemarle Street.

OBSERVATIONS ON THE PRESENT STATE OF HISTORICAL LITERATURE, on the Society of Antiquaries, and other Institutions for its Advancement in England; with Remarks on Record Offices, and on the Proceedings of the Record Commission. Addressed to the Secretary of State for the Home Department.
 By NICHOLAS HARRIS NICOLAS, Esq.

8vo. price 7s. 6d.

2. A Refutation of Mr. Palgrave's Remarks on the "Observations on the State of Historical Literature;" together with additional Facts relative to the Record Commission and the Record Offices. By Nicholas Harris Nicolas, Esq.

In 1 vol. 8vo. price 12s. 1s.

3. The Privy Purse Expenses of Elizabeth of York, and the Wardrobe Accounts of Edward the Fourth; with Original Memoir of Queen Elizabeth of York. By Nicholas Harris Nicolas, Esq.
 The Privy Purse Expenses of Elizabeth, the Consort of Henry the Seventh, contain notices of the sums paid for her travelling expenses, for her clothes, for the furniture of her palaces, for her jewels, for the support of her fools and minstrels, for her losses at cards, dice, and other games, for the attendance of her physicians, for the wages of priests, for gratuities to persons who brought presents, for her religious duties, and for the support of her sisters and their children, &c. many of which throw much light upon her personal character.

The Wardrobe Accounts of Edward the Fourth are chiefly valuable for elucidating the manners, dresses, and furniture of the ancestors in the fifteenth century, more particularly in relation to the Court, and to persons of rank; and for the composition of historical pictures, and for the stage.

The Memoirs of Elizabeth of York and of her sisters, and the introductory remarks which are prefixed to the volume, present new facts, and it is presumed, correct many important errors in the history of the reigns of Edward the Fourth, Richard the Third, and Henry the Fourth.—*Preface.*

William Pickering, Chancery Lane, London.

Dr. Lardner's Cabinet Library.

Great Britain's Crisis: Reform, Retrenchment, Economy! THE HARD CASE OF THE FARMERS, and the DISTRESSED CONDITION OF THE LABOURING POOR. A Letter to the Right Hon. Sir James Graham, Bart. &c. By PHILANTHROPOS.

London: Printed for Longman, Rees, Orme, Brown, and Green; and Perry and Harter, Sherborne.

Should Heaven, in its goodness and wisdom, see fit to inspire the Ministry at large with confidence in the present Ministry—a Ministry already enjoying the confidence of our "patriot King" (God bless him!), and of most reflecting men in his dominions—old England (under Divine Providence) may fairly expect to experience, ere long, the blessings of Reform, Retrenchment, Economy, and the Relief of Public Distress. If the Ministry be not nationally supported—but I leave others to paint the probable consequences!

Christmas Present.

Under the Superintendence of the Society for the Diffusion of Useful Knowledge.

THE PURSUIT OF KNOWLEDGE UNDER DIFFICULTIES. 2 vols. bound in cloth, price 9s.

"This work, which is especially adapted to encourage the young in the pursuit of knowledge and virtue, contains Biographical Memoirs of some of the most illustrious and striking examples of excellence; and is illustrated with Portraits on steel, of Franklin, Ferguson, John Hunter, Captain Cook, Arkwright, Barry, and Watt."

London: Charles Knight, Pall Mall East.

Beautifully printed, price 3s. in extra cloth boards,
THE DEATH WAKE; a Necromant, in Three Chimeras.

By THOMAS T. STODDART.

"It's like that lead contains her—
 It were too gross
 To rib her cerecloth in the obscure grave."—Shakespeare.

"We look upon Mr. Stoddart as possessing genius of great promise."—*Edinburgh Literary Journal.*

"Never, we believe, since the days of Percy Bysshe Shelley hath so truly an original and powerful a poem been given to the public."—*New North Briton.*

Edinburgh: Printed for Henry Constable; and Hurst, Chance, and Co. London.

In 1 vol. 8vo. 3d edition, price 16s. boards, or beautifully coloured by Reeves, price 11s. 6d. boards.

ELEMENTS OF CONCHOLOGY, according to the Linnaean System; illustrated by Twenty-eight Plates drawn from Nature.
 By the Rev. E. I. BURROW, A.M. F.R.S. F.L.S.

1 vol. 8vo. price 6s.

THE DAUGHTER OF HERODIAS; a Tragedy.
 By HENRY RICH, Esq.
 Printed for J. Andrews, 167, New Bond Street.

A new edition, 2 vols. small 8vo. 10s. 6d. half-bound,
BERTHA'S JOURNAL; comprising a variety of interesting Information for Young Persons.
 Arranged for every Day in the Year.
 John Murray, Albemarle Street.

BOOKS IN THE PRESS.

THE QUARTERLY REVIEW, No. LXXXVII. will be published on Wednesday, January 30th.

Family Library.

On Wednesday will be published, Illustrated with Eight Engravings, &c.

NO. XIX. OF THE FAMILY LIBRARY; being the Fourth Volume of Lives of the most Eminent British Painters, Sculptors, and Architects.

Volumes now published, 5s. each—

1 and 2. Life of Bonaparte	14. British Physicians
3. Alexander the Great	15. British India
4, 10, and 13. British Artists	16. Demonology and Witchcraft, by Sir Walter Scott
5, 6, and 9. History of the Jews	17. Life and Travels of Bruce
7. Insects	18. Adventures of the Companions of Columbus, by Washington Irving
8. Court and Camp of Buonaparte	
11. Irving's Columbus	
12. Southern's Nelson	

The Family Dramatists, Nos. I. and II.; being Vols. I. and II. of the Works of Philip Massinger. Illustrated with Explanatory Notes, and adapted to the Use of Families and Young Persons, by the omission of exceptional passages.
 John Murray, Albemarle Street.

JOURNAL of the ROYAL INSTITUTION.

Among the Original Papers in the Second Number, which will be published on the 1st of February, 1831, are the following:—On the Decomposition of the Vegetable Alkaline Salts, by W. T. Brande, Esq. F.R.S. &c. &c.—On a peculiar Class of Optical Deceptions by Michael Faraday, Esq. F.R.S. &c. &c.—On the Mode of ascertaining the Commercial Value of Manganese, by Edward Turner, M.D. F.R.S. &c. &c.—Professor of Chemistry in the London University—On Magnetics Curves, by Mark Rogee, M.D. Secretary of the Royal Society, &c. &c.—On the Construction of Arches, by M. Lussault, Architect to the King of Prussia, communicated by Professor Whewell—On Vomiting, by Marshall Hall, M.D. &c. &c.—On Stuttering, by the Same—On the Aurora Borealis of the 7th January, 1831, by S. H. Christie, Esq. F.R.S. &c. &c.—On the Performance of the Magnetism in Steel Bars, by the Same—On the Invention of the Telescope, by Professor Moll of Utrecht—On the Rainbow, by Alfred Ainger, Esq.—On the last Eruption of Mount Vesuvius, by Dr. Donati—On a New Comet, by Professor Moll—On Induced Phosorescence, by Mr. Thomas Pearson—Description of a new Hydraulic Siphon, by Mr. Almond—With the usual Miscellaneous Scientific Intelligence, &c. &c.
 John Murray, Albemarle Street.

THE EDINBURGH REVIEW, No. 104, will be published next week.

Contents: I. East India Company; the China Question.—II. Dr. Bowring's Poetical Translations.—III. McCulloch's Principles of Political Economy.—IV. On the Civil Dispositions of the Jews.—V. Comparative View of the Social Life of England and France.—VI. Essays on the Pursuit of Truth, on the Progress of Knowledge, &c.—VII. On the Capital Punishment of Forgery.—VIII. Novels descriptive of Irish Life.—IX. Sir Daniel Sandford's Translation of Thiercher's Greek Grammar.—X. On the Life and Opinions of Bishop Heber, and the Evangelical School: Life of Heber; Last Days of Heber; on the Lives of Cowper, Newton, and Heber.—XI. Irish Courts of Quarter Sessions, and Assistant Barristers.—XII. Sadler's Refutation of the Edinburgh Review, and the Proof of his Theory of Population.—XIII. The Late and the Present Ministry.

Printed for Longman, Rees, Orme, Brown, and Green, London; and Adam Black, Edinburgh.

Dr. Lardner's Cabinet Library.

On the 1st of February will be published, in small 8vo. price 1s. the First Volume of the

LIFE and REIGN OF GEORGE IV. In 3 vols. Being Vol. II. of Dr. Lardner's Cabinet Library.

The volume already published is

Military Memoirs of Field Marshal the Duke of Wellington. 3 vols. Vol. I. By Capt. Moyle Sherer.

To be published,

March 1. Annual Retrospect of Public Affairs in 1830. 1 vol.
 April 1. View of the History of France, from the Restoration to the Revolution of 1830. By T. B. Macaulay, Esq. M.P.
 May 1. Military Memoirs of Wellington. Vol. II.
 Printed for Longman, Rees, Orme, Brown, and Green.

Journal of Belles Lettres, Arts, Sciences, &c.

This Journal is supplied Weekly, or Monthly, by the principal Booksellers and Newsmen, throughout the Kingdom; but to those who may desire its immediate transmission, by post, we recommend the LITERARY GAZETTE printed on stamped paper, price One Shilling.

No. 732.

SATURDAY, JANUARY 29, 1831.

PRICE 8d.

REVIEW OF NEW BOOKS.

Memoirs of the late Captain Hugh Crow, of Liverpool; comprising a Narrative of his Life, together with descriptive Sketches of the Western Coast of Africa, &c. &c. 8vo. pp. 316. London, 1830, Longman and Co.; Liverpool, G. and J. Robinson.

THE gallant Captain Hugh Crow, whose portrait, with a cock in his right eye, (lithographed by William Crane, and of course a bird's-eye view), and a telescope in his right hand, does honour to this volume, by standing frontispiece in stone, is neither related to the equestrian Du-Crow, nor to the Margate navigator, the renowned Captain Crow, celebrated by Peter Pindar for insisting on his passengers being sea-sick, with all the privileges of that disorder. On the contrary, he is, or rather was, himself alone, a right-earnest, unflinching, though considerate and humane, slave trader; one of the most successful from the port of Liverpool: and his executors have published these his memoirs, to shew that the devil is not so black as he is painted, nor the traffic in negroes so very horrible as it is represented.

To be sure we are startled a trifle by the bold propositions here advanced; but when we go into the details, we are forced to own that there is no cause upon which something may not be said on both sides. Indeed, Captain Crow, to use a common saying, has taken the bull by the horns; and those who are influenced by his statements and arguments will be apt to think that British humanity might be as well employed in alleviating the distress of the suffering lower orders, the starving peasantry and mechanics at home, as in roaming to the coast of Africa in quest of objects on which to expend the laudable feelings of philanthropy. It may be urged, that both are entitled to Christian sympathy and relief: but again the reply is, the greater charity lies at your own door and before your own eyes; perform what it demands, and then let your spirit of universal benevolence pervade the earth, from pole to the pole. But, remember, your duty is to attend to your poor neighbours, to your sick paupers, to your ill-clothed, ill-warmed, naked countrymen, first; watch and witness the comfort you can administer to them, and, if, by your conscience dictates it, any surplus portion of your wealth to alleviate the remote miseries of mankind.

But we are not going to preach the homily thus embodied by Captain Crow, and we are neither obliged to see with his eye nor his telescope. Our affair is to make his volume fairly known; and for this, a few extracts from the sketches it details, and a few more from the opinions it expresses as the result of much experience in "slaving," will suffice.

Captain Crow began his career as a sea-boy, "on the high and giddy mast," and he made more hardships when below; his blagued conduct raised him gradually to the command of several fine vessels engaged in the slave trade, till his career was closed by act of

parliament. Previous to his engaging on the African coast and the West Indies, he performed some voyages to the north seas and elsewhere, the perils attendant upon which remind us of the striking stories of our elder sailors in their little venturous barks. But we leave these, and commence our quotations with a Transatlantic anecdote.

"That the credulity of some of the Americans is equal to that of any other nation, the following fact will exemplify. One night, in the house of a respectable person in Charleston, I overheard a conversation relative to my native island, to which I naturally paid every attention. One of the speakers expressed his assurance that the Isle of Man turned right round every seven years; and that unless a fire were kept burning in it night and day, it would certainly sink! This relation excited much wonder and amazement amongst the company, and I was not a little amused to find so romantic an idea of my native land entertained in a foreign country."

In a voyage to Memel, in 1785, we have the following description of a curious piscatory scene.

"One morning during a calm, when near the Hebrides, all hands were called up at three in the morning to witness a battle between several of the fish called *thrashers* and some *sword-fish* on one side, and an enormous *whale* on the other. It was in the middle of summer, and the weather being clear, and the fish close to the vessel, we had a fine opportunity of witnessing the contest. As soon as the whale's back appeared above the water, the thrashers springing several yards into the air, descended with great violence upon the object of their rancour, and inflicted upon him the most severe slaps with their tails, the sound of which resembled the reports of muskets fired at a distance. The sword-fish, in their turn, attacked the distressed whale, stabbing him from below; and thus beset on all sides and wounded, when the poor creature appeared, the water around him was dyed with blood. In this manner they continued tormenting and wounding him for many hours, until we lost sight of him; and I have no doubt they, in the end, accomplished his destruction."

We must now skip twelve years. Sailing from Dominica to England, the captain relates a little nigger tale.

"We had on board a fine black boy, brought from Bonny, named 'Fine Bone,' about fifteen years of age. When we got further north, the cold began to pinch him severely; and being very fond of me, he one morning came shivering to the side of my cot, and said, 'Massa Crow, something bite me too much, and me no can see 'im; and me want you give me some wash mouth, and two mouth tacken.' I knew that 'wash mouth' meant a dram; and he soon gave me to understand, by getting hold of my drawers, what he meant by 'two mouth tacken.' I furnished the poor fellow with the needful, and as he had shoes, stockings, and jacket before, he was quite made up."

Our author's principal port for slaving was Bonny; and his accounts of the manners and customs of the inhabitants, even after all that has since been published about the Africans, are often extremely characteristic. For instance:

"While at Bonny a distressing ceremony took place, which occasioned some delay in the shipment of our cargo. It was the custom there, once in seven years, to sacrifice a virgin, of fifteen or sixteen years of age, as a propitiatory offering to Boreas, the god of the north wind. For some weeks previous to the sacrifice, the female selected is led through the town, attended by numbers of priests, visiting every house, rich and poor, and whatever she fancies is immediately granted her. When the poor creature is satisfied with her booty, and (strange infatuation!) expresses her willingness to die, she is placed, with all the articles she has collected, into a large canoe, and taken to a place about twenty miles from the town, where, together with her booty, she is thrown into the sea by the priests, and is instantly devoured by the sharks. While the preparations for a repetition of this sacrifice were going on, I made repeated endeavours to persuade the great men and priests to abandon their cruel intention; but, unhappily, my expostulations were in vain, and another young woman was added to the list of those who had fallen victims to the ignorance and superstition of their tribe. The painful impression made on my mind by this barbarous ceremony was yet fresh, when a Quaw chief, being taken in battle, was sent from the interior to King Pepple, and the great men at Bonny, to be eaten at a grand feast. In this instance, too, I did my utmost to dissuade the king and the priests from their horrible purpose, and I offered them the price of three slaves to save the life of the captive, who was a fine-looking man. Neither arguments nor money, however, could avert his fate. He was put to death; and those who had feasted on his body, afterwards boasted of the delicious treat they had enjoyed."

"During my stay at Bonny on this trip, a dreadful catastrophe took place in the harbour. Amongst twelve or fourteen sail of vessels that lay in the river, was the ship Bolton, of Liverpool. She had on board about a hundred and twenty negroes; and these men, not being properly guarded, contrived to free themselves in the night from their irons, and, rising upon the officers and crew, they took possession of the ship. Unfortunately, the trade powder, in quantity about two hundred barrels, was stowed in the fore peak, and to this the insurgents, in their rage for mischief, soon found access. At daylight, by which time the circumstance became known, the several masters of the vessels in the river held a meeting to determine how the ship and cargo might be redeemed. The result was, that I and some others were appointed to go on board the Bolton, and endeavour, if possible, to save the blacks from that destruction to which, in their ignorance, they were so fearfully exposed. They con-

sisted chiefly of Quaws, a most desperate race of men. Before we got on board they had brought up many barrels of the gunpowder, which they had started and spread all loose between decks. It would have been madness for any of us to go below amongst them, for a single spark thrown by one of them amongst the powder, would have involved us in instant destruction. We prevailed upon a few Eboes to leave the vessel; and these, with all the women, were taken on board of some of the other ships. The Quaws were deaf to all our entreaties and warnings, until towards evening, when a number of them also gave themselves up, observing, probably, the danger to which they were exposed. The ringleaders, however, to the number of about a dozen, obstinately remained amongst the loose powder, so that no one had the hardihood to venture amongst them. In this situation they remained until the afternoon of the next day, when we observed the ship to be on fire; and as she was the headmost vessel in the river, we manned all our boats, in order, if possible, to tow her off, lest she might fall amongst us. We had been but a few minutes in the boats, when, with all the unfortunate creatures on board of her, she blew up with a tremendous explosion. I was in our boat with eight or nine of my best men, and only about a hundred yards from her, when the catastrophe occurred; and such was the violence of the shock, that the poor fellows fell down in the bottom of the boat. The smoke, the pieces of the wreck, the clothes, and other articles of trade, that flew about in every direction, presented a scene truly awful. Several of the latter fell into our boat, and many articles were afterwards found blown as far as the town of Bonny. After this misfortune, it became necessary to be more watchful of the blacks, and particularly of the Quaws, who, instigated by the example of their insurgent countrymen, had already begun to exhibit an impatience of restraint.

On another occasion his ship was on fire, but fortunately the explosion was prevented. He says:

"I shall never forget the scene that followed the suppression of the flames. When I got on deck, the blacks, both men and women, clung round me in tears; some taking hold of my hands, others of my feet, and all, with much earnestness and feeling, thanking Providence for our narrow escape,—an expression of gratitude in which, I assure the reader, I heartily joined them. On this passage, I witnessed a remarkable instance of animal sagacity and affection. As I before mentioned, we had several monkeys on board: they were of different species and sizes; and amongst them was a beautiful little creature, the body of which was about ten inches or a foot in length, and about the circumference of a common drinking glass. It was of a glossy black, excepting its nose and the end of its tail, which were as white as snow. This interesting little animal, which, when I received it from the governor of the island of St. Thomas, diverted me by its innocent gambols, became afflicted by the malady which yet unfortunately prevailed in the ship. It had always been a favourite with the other monkeys, who seemed to regard it as the last-born, and the pet of the family; and they granted it many indulgences which they seldom conceded one to another. It was very tractable and gentle in its temper, and never, as spoiled children generally do, took undue advantage of this partiality towards it, by becoming peevish and headstrong. From the moment it was

taken ill, their attention and care of it were redoubled; and it was truly affecting and interesting to see with what anxiety and tenderness they tended and nursed the little creature. A struggle frequently ensued amongst them for priority in these offices of affection; and some would steal one thing and some another, which they would carry to it untasted, however tempting it might be to their own palates. Then they would take it gently up in their fore paws, hug it to their breasts, and cry over it as a fond mother would over her suffering child. The little creature seemed sensible of their assiduities; but it was wofully overpowered by sickness. It would sometimes come to me, and look me pitifully in the face, and moan and cry like an infant, as if it besought me to give it relief; and we did every thing we could think of to restore it to health; but in spite of the united attentions of its kindred tribe and ourselves, the interesting little creature did not long survive."

With this we shall close our miscellaneous quotations, which will shew that there is considerable interest and entertainment to be found in these pages; and proceed, as we proposed, to give two or three extracts relative to the slave trade and its abolition, according to the views of Captain Crow, whose last voyage was performed just in time to witness the end.

"It had been (he tells us) reported to the chiefs and the natives, by the captains who preceded me, that I commanded the last ship that would sail to Bonny for negroes. My friend King Holiday consequently repaired on board as soon as we arrived, to inquire if the intelligence were true. We had, as might be expected, a long palaver on the subject, in the course of which the king expressed himself, as nearly as I can remember, in the following terms:—'Crow!' he remarked, 'you and me sabby each other long time, and me know you tell me true mouth (speak truth); for all captains come to river tell me you king and you big mans stop we trade; and 'spose dat true, what we do? for you sabby me have too much wife, it be we country fash, and have too much child, and some may turn big rogue man, all same time we see some bad white man for some you ship, and we hear too much white man grow big rogue for you country. But God make you sabby book and make big ship—den you sen you bad people much far for other country, and we hear you hang much people, and too much man go dead for you warm (war). But God make we black' (here the poor fellow shed tears), 'and we no sabby book, and we no havy head for make ship for sen we bad mans for more country; and we law is, 'spose some of we child go bad and we no can sell 'em, we father must kill dem own child; and 'spose trade be done, we force kill too much child same way. But we tink trade no stop, for all we Jew-Jew-man' (the priests) 'tell we so—for dem say you country no can niber pass God A'mighty.' The last words he repeated several times; and the reader, it is presumed, will find his remarks not altogether destitute of sense and shrewdness."

At Kingston, whither he went with his cargo, he adds:—

"The consequences of the abolition of the African trade appeared to me then, and appear now to be, pernicious not only to individuals, but to England at large. Besides other advantages, it was a nursery for our seamen, as well as a benefit to our West India colonies. How, indeed, could England rear and maintain those men who are to defend the state, were it not for her colonies. But for the employment

which they afford, we should be as destitute of defence as the Africans themselves. If the pretenders to humanity have a mind to do good, let them first begin at home: let them look to Ireland, which is in a most deplorable state of slavery and disaffection—for which no politician has yet discovered an adequate remedy. It may be added, that when the African trade was abolished, many fine young men, being thrown out of employment, entered into the American service, and there is no doubt were afterwards employed to fight against the country that gave them birth, their prospects at home being entirely blighted. It was on a Sunday morning when I landed at Kingston; and I found a number of my old shipmates (blacks), all neatly dressed, waiting on the wharf to receive me: some of them took hold of my hands; and the general expressions of welcome and good will were—'God bless massa! How massa do dis voyage? we hope massa no fight 'gen dis time.' While they thus congratulated me on my arrival, a wag, one of their own party, jeeringly exclaimed—'Who be dis Captain Crow you all sabby so much?' And my black friends replied, 'What dat you say, you black negro? Ebery dog in Kingston sabby Captain Crow, and you bad fellow for no sabby him;' with which they fell a beating him with so little ceremony, that I was obliged in good nature to interfere. I rather suspect this was a joke contrived among them when they saw me coming on shore; for the blacks have craft and sport sufficient for a frolic of the kind. Be this as it may, I was not a little gratified by their friendly visit."

And, in conclusion—

"As I have in the course of my narrative made frequent allusions to the unfortunate slaves, lest my remarks be misconstrued, I owe it to myself here to disclaim being a friend to slavery. God forbid that I should favour a system through which my fellow-creatures should suffer any species of oppression, hardship, or injustice! I consider that the abolitionists have not understood the subject, and that their measures have done nothing towards the real abatement of slave-dealing in Africa. They have, in fact, as I have before remarked, transferred the whole of the trade into the hands of other nations, who carry it on with extreme cruelty. In the course of my remarks, I have viewed the abstraction of slaves from Africa to our colonies as a necessary evil, under existing circumstances. I may be mistaken on this point; but I am convinced, nevertheless, from what I have observed, that the negro slaves of the West Indies are generally happier there than when they lived as slaves in their own country, subject to the cruelties and caprice of the inland chiefs, and living in a savage state; and, for my own part, were slavery to be my lot, I would rather be a black slave in the West Indies than a white one at home; for there is no comparison between the comforts of the one and those of the other. Think, for instance, of the poor fishermen during the winter season—some of the greatest slaves in existence. Think of the miserable beings employed in our coal-pits, and in our iron, lead, and copper mines—toiling under ground in unwholesome air, which is constantly liable to fatal explosions! Think of all the men, women, and children, confined by hundreds in heated factories, their health rapidly wasting, and their earnings scarce sufficient to keep soul and body together! Think of other slavish employments—often under masters quite as arbitrary and unfeeling as the planters! Think of the thousands who are

rotting in jails for petty offences, to which many of them are driven by want and starvation! Think of the thousands that have been imprisoned, ruined, for killing a paltry hare or a partridge! Think of the wretched Irish peasantry! Think of the crowded workhouses; and do not forget to think of poor Jack, who, after devoting himself to a life of toil and danger in a vocation to which his country owes much of her prosperity, is dragged by the hair of his head to shed the blood of his fellow-creatures at the hazard of his own life; or, perhaps, to wear out an embittered existence in foreign stations, far from those who are nearest and dearest to his affections! Let the reader contrast these things with the general comfortable condition of the negroes in the West Indies, and he will have no difficulty in pronouncing to which side (the black slave or the white) the balance of happiness preponderates. It is clear that, from the various natures, dispositions, talents, and energies, of men, there must exist in every society a mixture of rich and poor, and that slavish occupations will necessarily fall to the lot of those who are incapable or undeserving of higher employments. This is a dispensation of that wise Providence that rules over all; and I will, in conclusion, venture to affirm, while I deplore the fact, that the genuine friends of humanity who are not hoodwinked by prejudice or ignorance, or blinded by self-interest, will find that slavery in its essence exists at home as well as abroad."

But all our readers now sabby as much of dis Captain Crow as "eberry dog in Kingston" did, or, at least, as we can make them sabby; and so we must hold no more palaver. He has gone to his account, where slave-dealers and abolitionists alike must go; and where that Being who alone can search the human heart, will judge of their motives as well as their actions.*

Lives of the Italian Poets. By the Rev. Henry Stebbing, M.A., M.R.S.L. With medallion Portraits. 3 vols. 12mo. London, 1831. E. Bull.

CLOSE as is the connexion between the history

* As our worthy anti-slavery friends will, no doubt, have a Crow to pick with the author, we think it right to add, as a note, the latest intelligence from the slave-coast. It is vastly important to the unprejudiced observer.

On the 24th of last August, the *Primrose*, anchored in the Bay of Loango, heard that the Spaniards, Portuguese, and Brazilians, had destroyed all their forts, &c. on the southern coast, and had entirely given up slaving there. The King of Loango having brought down to the coast sixty slaves, and finding no vessels there, very coolly ordered them to be butchered, as he could not afford to feed them. The place where these unfortunate people suffered is not far from the beach, and was visited by the officers of the *Primrose*, who saw their white bleached bones lying on the face of a hill. This place is the most civilised part of the southern coast! The natives speaking broken English, Spanish, Portuguese, and Dutch. The king has two sons grown up; and if physiognomy is good for any thing, they might be Christianised, and prove a blessing to that part of barbarous Africa. The *Lady Combermere*, a British (Liverpool) trader, was lying there. The king and chiefs are very much dissatisfied at the abolition of slavery; but the idea they have of King Billy, the name they give to our king, is rather curious. They say, "Suppose King Billy tell Spaniard, France, Portuguese, and Dutchman, for no slave—he no slave! O, he one man too big!" The abolition of slavery is the abolition of war, for slaves cannot be obtained unless by fighting. This man can procure fifteen hundred slaves every ten days! and actually offered to supply the *Primrose*. On the 4th of last September the *Primrose* sailed from Prince's Island, and on the 7th captured the celebrated slave-ship *Velos Passagera*, in twelve minutes. The *Velos* is larger than the *Athol*, having five feet greater breadth of beam on her main deck, mounting twenty guns, and with a crew of 150 men. The *Primrose* lost three killed and twelve wounded; and the *Velos* lost forty-three killed and twenty wounded. The *Velos* had 355 slaves on board, and is the largest slave ever taken. The action between her and the *Primrose* was the first single action fought since the accession of our present king, and is certainly one of the most gallant things on record—the fighting force of the *Velos* being more than double that of the *Primrose*.

of Italian and English poetry, it is extraordinary that no one, before the reverend author of these *Lives*, should have turned his attention to the biographies of the Italian poets. The subject is certainly far from wanting sufficient interest, as Mr. Stebbing himself observes in the preface to his work. "Many of the Italian poets lived in times when genius conferred upon its possessors rank and influence, as well as fame: others had to pass through vicissitudes, with which it is always instructive and animating to see the human mind virtuously and successfully struggling; and all of them had a deep and enthusiastic veneration for their art, which renders their career worthy of the constant observation and imitation of literary men of other ages and countries."

Italy was the cradle of modern learning; and to her poets we owe, in great measure, its present diffusion among the people of Europe. Nor can the neglect of this amusing and instructive subject be attributed to the want of materials to work upon, since few nations have bestowed so much care upon their literary history as the Italians. The history of Italian literature by Tiraboschi, as well as his minor historical works, are a most valuable fund of information; whilst the scrupulous correctness of Zeno, and the Herculean undertaking of Mazzuchelli, shew with what zeal it has been attempted to do away with the fables introduced, either by ignorance or party spirit, into the biographical accounts of the most illustrious of their poets. Our lively neighbours, who are not very apt to overvalue the merit of foreigners, possess a pleasing, although rather spiritless and tame, work on the subject, in the history of Ginguené, who was, however, prevented by death from completing it. M. Sismondi, the historian of the Italian republics, has written a very valuable essay on the history of Italian literature, which forms the best part of his *Literature of the South of Europe*, well known to the English reader through the translation of Mr. Roscoe, whose name is a sufficient guarantee that it was well done. But of original works on the subject in this country, we believe Mr. Stebbing's to be the first.

We are glad of it; for whilst it is very doubtful whether the task would have been executed as well by any other hand, it is most probable that it would have interfered with the publication of the volumes before us; it being one of the consequences of an indifferent work to deter others from writing a good one on the same subject. The reverend author has bestowed particular attention on facts, without being too dry and tedious; and when he indulges in critical remarks, he does so in a very easy and unpretending manner, without pedantry or flippancy. Take, for instance, the following remarks on the state of literature and the social station of literary men after the middle ages.

"Learning, at its revival, like all other novelties, was an object of wonder and admiration. It was a new sun in the moral hemisphere; and even those who could not understand either whence it derived its brightness, or in what its precise glory consisted, were led to regard the elect few who understood its mysteries, with veneration, and even awe. The ability to trace back the course of things to ages the most remote—to describe the manners of generations that had, till now, been swept away from men's memories—to bring back even the mighty spirits of the olden time, and reveal what they thought and saw in the days of inspiration: this was, indeed, a wonderful power to people who had not been made,

familiar with such things by the universal diffusion of books and knowledge—and those who exercised it were not unworthy of the high honour which they received. They were, many of them, believed to have the faculty of changing the course of nature—of foretelling events, and making the powers of other worlds obedient to their will. But the admiration which this belief acquired for them with the vulgar, was not so high as that which they deserved for what they did in reality. They exercised a magic, but it was that which the Providence of heaven had taught them; and, instead of merely commanding the spirits of the deep to do their temporary bidding, they bound them in the everlasting bonds of truth and science."

There is one particular merit in these *Lives*, viz. the total absence of acrimony and ill-nature towards any person; a charitable disposition to excuse men's faults, without attempting, however, to conceal them; and a very mild tone in reprobating human frailties. Of this, as well as of the powers of the author in forming an estimate of the character of his personages, let the following be an example. It is taken from the life of Petrarch.

"The writings of Petrarch are so replete with intimations respecting the situation of his mind—the working of his thoughts—the conflicts he was continually waging with his inclinations, that no one, perhaps, ever passed from the earth leaving so many materials with posterity for judging of his character. And with these before us, our reasons for admiring it seem to multiply every time we renew the examination. Beneath his passion for fame we can discover more deeply seated the love of country,—the ambition to see it free and happy,—and the resolution to speak in its cause when all other tongues faltered, or were silent. When yielding to inclinations which ought to have been suppressed in their origin, the error was followed neither by indifference nor a wish to justify it, but by painful struggles to overcome temptation in the future, and by a deep and earnest penitence. With the little weaknesses to which an occasional outbreaking of personal vanity exposed him, we may fairly contrast that love of solitude which so often led him from the world, where he might have been loaded every day of his life with the incense of flattery; that noble and sedate contemplativeness, which gave him an elevation of thought and spirit scarcely reached by any of his contemporaries; and that ingenuous and ready acknowledgment of error, which made him despise the little arts of concealment and perversion, to which inferior and less virtuous minds have recourse. He was, in short, human, and prone to some of the most dangerous of human passions; but he at the same time possessed the qualities that make the word humanity a synonyme for all that is most gracious and amiable in nature."

These will be sufficient specimens of the high merit of these volumes, to recommend them to the perusal of those who take an interest in the progress of civilisation throughout Europe, since the thirteenth century: it began with Dante, whose biography is the first in Mr. Stebbing's work. A few slight mistakes, not worth noticing, will no doubt be corrected in a future edition of these *Lives*, which we expect soon. We think that an additional volume, containing the biographies of a few more poets of less note, but yet of great merit, would prove acceptable to the public. We should like to see the lives of Molza, Caro, and a few others of their times, added to those already written by Mr. Stebbing.

bing; and we would advise him not to forget Goldoni, Monti, Pindemonte, or Cesarotti, among the modern poets of Italy.

Thoughts on the Origin and Descent of the Gael, &c. By James Grant, Esq. of Corrimony. 8vo. pp. 456. London, Underwood; Smith, Elder, and Co.

Identity of the Religions called Druidical and Hebrew, &c. &c. 12mo. pp. 125. London, J. Nimmo; Edinburgh, Blackwood; Dublin, Curry and Co.

The Scottish Gael, &c. By James Logan. 2 vols. 8vo. Smith, Elder, and Co. (Third notice: conclusion.)

WE have classed these works together on account of their analogy, though the two former have been published some time, and the last was reviewed in recent Nos. of our Journal. They all discuss interesting subjects, and, whatever theories they support, are well worthy of the attention of antiquaries. Mr. Grant contends, that the original inhabitants of all the British Islands were universally the descendants of the great Gallic nations, whose migrations tended westward from Asiatic regions; and that, therefore, Celti, Gael, Cwmri, Wael, &c. &c., are only branches of the same stock. The author is also a decided believer in the authenticity of Ossian's poems, and warmly recommends a literal translation of these wonderful ancient compositions. The volume, altogether, contains a vast quantity of very curious matter, of high interest to the antiquary, philologist, and grammarian, and of hardly less interest to the general reader; and another grand recommendation is, that the subjects of which it treats are so peculiarly British. Many of our countrymen may view with comparative disregard the deciphering of monuments which record the ancient dynasties of Egypt or of Greece, and their exploits; but no one can investigate the earliest events that mark the history of their own progenitors, without feelings of an order in which it delights the intelligent being to indulge.

The chief object of the smaller volume is to shew, by an examination of the different rites among the Druids and Hebrews—such as grove worship, the adoration of the oak, the circular form of their temples, the raising up of lithol, cairns, vestal fires, the worship of the serpent and bull, &c. &c.—the close relation between these two religions. The writer also points out the connexion between the Hebrew and the Egyptian, Canaanite, Carthaginian, Armenian, Persian, Arabian, Chaldean, Etruscan, Umbrian, Indian, Grecian, and Roman rites. Now, though a certain family likeness has prevailed among the earlier religions, emanating, as they ever did and ever will, from the same great principles in human nature—the absolute necessity of fear and love; we must say the author fails to convince us that the mild and open religion of the patriarchs was essentially the same with the cruel and mysterious faith of the Druids. Without entering into discussion with him, however, as we are about to take a more general view of the question, we shall content ourselves with observing, that this clever essay is the first literary production from the London University, to which society the young student has dedicated his performance.

But, upon consulting all the best authorities (and many of them very difficult of access), we think we may adopt the following opinions—setting out with the great groundwork, that Chaldaea is the cradle of our species, and the parent country of the arts and sciences. If Chaldaea, then, be the central country of man-

kind, the radii that have emanated from that centre must retain marks of affinity which can never be totally effaced.

As the grand dispersion and migration most probably took place at the confusion of tongues, it is natural to suppose that a great change would be occasioned, in proportion as strange countries and new climates became inhabited. It would appear that language suffered a material alteration, since, as new notions and ideas arose and became complex, words expressive of them, compounded by the union of monosyllables and their radices, variously pronounced, must have been formed. But the master features of resemblance were not destroyed, since they are perceptible in every known language: hence, we may infer, that the confusion of tongues was no other than different modes of pronunciation; and, indeed, in almost all the leading characteristics by which nations can be distinguished, most particularly in religion, striking marks of similitude manifest themselves. It is to be presumed, therefore, that a general affinity has immemorially subsisted among the most conspicuous inhabitants of the primitive world.

A remarkable connexion between the Hindus and Egyptians is indisputably established. The Society of Calcutta, we believe, first suggested the resemblance, and promoted the investigation; since which, Mr. Maurice, in his profound disquisitions throughout the Indian antiquities, has carried on the investigation with the deepest research, and has so clearly pointed out every feature of resemblance, that every friend to revealed religion will consider himself indebted to his laborious researches; while every admirer of an animated and elegant style will read his works with peculiar satisfaction.

After elaborate descriptions of the Indian pagodas and the temples of the Thebais, after analysing and comparing all the hieroglyphics and sculptured images that bear the least affinity, examining every festive rite and religious institution—that learned gentleman demonstrates the mythology of the Hindus and Egyptians to have had the same origin, and that, in reality, at present they are not greatly dissimilar. In short, he pronounces all the mystic rites celebrated in the caverns of Salsette and Elephanta, thence diffused throughout all Asia, as well as Europe, in Persia, in Greece, and in Rome, which passed under the denominations of Mithraic, Orphic, Eleusinian, and Bacchic, together with the mysteries of Osiris and Isis of Egypt, to have been derived from the ancient worship of the Surya, the solar fire, which originally was adored in Chaldea or Syria. Hence, there is truth in the old Latin proverb—

“Tradidit Ægyptis Babylon, Ægyptus Achivæ.”

In a modern publication of a Tour in Egypt, by Captain Light, a circumstance is mentioned as corroborative of the connexion between the Indians and Egyptians:—“As soon as some Hindoo sepoy, who came into Egypt by the Red Sea, at the close of the war, to assist our army there, were introduced to the ruined temples on the Nile, and beheld the figures of the Egyptian deities contained in them, they immediately worshipped them.”

Sir William Jones, in his *Dissertation on the Gods of Greece, Italy, and India*, says:—“We cannot doubt of a great similarity between the popular worship of Greece, Italy, and India, and that of Egypt, China, Persia, Phœnicia, and Syria; to which, perhaps, we may safely add some of the southern kingdoms, and even islands of America; while the Gothic system which prevailed in the northern regions

of Europe was not merely similar to those of Greece and Italy, but almost the same in another dress, with an embroidery of images, apparently Asiatic.”

The relation between the Hindus and Egyptians being admitted to be clearly pointed out, we shall observe a *striking connexion between the Hindus and Gothic or Celtic tribes*, by demonstrating the Druids to have borrowed their rites from the Brahmans, and to have been introduced into Germany, Gaul, and Britain, by the progenitors of the northern and western regions, the descendants of Gomer. We must consider the Celtic tribes as one family, generally denominated Scythians and Celto-Scythians—in short, those Gothic hordes which first emigrated from Asia into Europe. Sir William Jones confidently assumes the Goths and the Hindus to have sprung from the same source—that they originally had the same language, gave the same appellations to the stars and planets, adored the same false deities, and professed the same notions of rewards and punishments. It is universally acknowledged, that the Brahmin religion has flourished immemorially in Tibet; and the priests of Buddha have been found settled even in Siberia. Admitting that these priests of Buddha, using the Indian letters, had travelled thus far, it cannot be thought improbable, that with the colonies which emigrated from northern Asia into the West, many of these priests might have wafted into Europe many of the sacred and civil institutes of Brahma. Among the most forcible arguments that may be advanced in support of this hypothesis, is the very singular circumstance of the Indian god and planet Boodh, under the title Woden and Mercury, conferring his name over all the northern and western empires of Europe. The identity of the god-king Oden, or Woden, with Buddha and Mercury, is confirmed beyond all dispute. The learned Bochart thinks Mercury was no other than Canaan, the son of Ham, mythologised; for Canar and Canaan signify trader, which is the exact import of the Celtic Merc, or Mercator. It was in this signification that his statues were always placed in the fori and market-places, as the god of commerce. He is the same as the Taut of the Phœnicians, the Fohi of China, the Hermes of the Egyptians, and the Theutates of the Gauls. The Druids, Celtic tribes, and Gauls, therefore, equally worshipped this deity, as well as the Egyptians, under the same symbols: the caduceus, which was composed of the globe, the serpent, and wings, may be traced in various characters among Gaulic or Druidical remains, particularly engraved at Abury in Wiltshire, as well as in the Thebais of Egypt. The worship of the sun was in reality the basis both of the Eastern and Western superstitions; and, therefore, if we find obelisks and other erected pillars in Egypt and Asia, so we may naturally expect to discover them in Gaul, or in the British isles. In the very word *obelisk* we may trace the oriental name of the solar deity Bal, known to the Druids by the resembling title of Belenus, their god of fire, and apparent in the term *bealtine*, or the fires that flamed to Baal on May eve.

We will not tax the patience of our readers by dwelling longer on a subject of this nature; but conclude with the two or three farther miscellaneous extracts which we promised from Mr. Logan's publication.

“An instance, apparently the latest, of a harper attending a highland army, occurs in the case of that sent against the catholic lords,

Errol, Huntly, and Angus, in 1594, on which occasion, Argyle carried with him his harper to animate his troops, unfortunately without effect. The prophecy of a witch, whom he also took with him, that it should be played at the Castle of Slanes, the Earl of Errol's seat, on a certain day, may have been literally true, for it could have been there sounded at the time foretold; but the Campbells had previously suffered a total defeat. A harp key, that had been, time immemorial, in the family of Lord Mac Donald, and that bore marks of antiquity, being ornamented with gold and silver, and a precious stone, making its value eighty or one hundred guineas, was presented by his lordship to the celebrated O'Kane. But the harps of Lude, that have been preserved so long by the Robertsons of that house, are now in possession of the Highland Society, and remain valuable relics in themselves, and evidence that this instrument held the same place in Scotland that it did in Wales and Ireland. One of these harps was brought from Argyle by a daughter of the Laird of Lamont, who married into the family about 1460, and is supposed to be some centuries older than that time; the other was presented by Queen Mary, when on a hunting excursion, to Beatrix Gardyn, daughter to the Laird of Banchory, near Aberdeen, who was married to Findla Mhor, an ancestor of the Farquharsons of Invercauld, from whom both families are descended; and such a present shews that to play on the harp was at that time an accomplishment of the ladies of Scotland, at least of the Highlands, for it is not to be supposed the queen would have bestowed this instrument on one who did not understand it."

"Of the ancient Celtic dancing we find some curious particulars. The Lusitani, says Diodorus, have a light and airy dance which they practise in peace, and which requires great dexterity and nimbleness of legs and thighs. In war, they march observing time and measure, and sing their triumphal songs when they are ready to charge the enemy. The passion for dancing was strong in all the Celtic race, and it was employed in the services of religion, some remains of which practice long continued among the Welsh, who were accustomed to dance in the churchyard. Rincefada, or field-dance in Irish, shews its relation to Rineadoir, a musician. This was performed to the Cuisley Cmil, a simple sort of bagpipe before described, and used to conclude all balls. When James II. landed at Kinsale, his friends received him with the rincefada, by which he was much gratified. The manner of its execution was thus:—three persons abreast, holding the ends of a white handkerchief, moved forward a few paces to the sound of slow music, the rest of the dancers following in couples, and holding also a white handkerchief between them. The music then changing to a quicker tune, the dance began, the performers passing successively under the handkerchiefs of the three in front, and then wheeling round in semicircles, they formed a variety of pleasing evolutions, interspersed with occasional entrechats, finally uniting and resuming their original places. The Manx are much addicted to dancing jigs and reels, in which four or five couple join to the music of a fiddle. English country-dances are unknown among them. We are told that the military dances of the old Irish were conducted by the Corisky, or dancing-master, a surname that yet exists in many families. The ancient Celts had a sort of Pyrrhic dance over swords, which is not yet entirely unknown; but the Gilli-Callum, which generally terminates a ball,

is supposed to have but a faint resemblance to the ancient sword-dance. The same observation may be applied to the dirk-dance. Both of them are, indeed, still executed by a few, and were exhibited in London some years ago by one MacGlassan; but a gentleman informed me that he knew a person who, at the age of 106, saw the dirk-dance performed, and declared it was not at all like that which he had formerly known. Besides these, it is evident from the words of an old Isle of Sky dancing song, *Bualadh mi u an sa chean*, 'I will break your head,' that the parties in the performance went through the evolutions of attack and defence. The chief art in the modern sword-dance consists in the dexterity with which the dancer escapes touching one or more swords or sticks crossed on the ground, the tune to which it was performed being called Gilli-Callum, and that appropriate to the dirk Phadric MacComish. There was a dance called Rungmor, of which little is now known: from the only description I could get of it, the dancer appeared in some manner to touch the ground with his thighs, without losing his balance. In Lochaber there was formerly a gymnasium for teaching all sorts of athletic exercises and graceful accomplishments, the scholars eating at a common table, being allowed a certain time for their meals, and submitting to other regulations; but, without tuition, the Highlanders excel in dancing. A perfect judge thus expresses himself: 'This pleasing propensity, one would think, was born with them, from the early indications we sometimes see their children shew for this exercise. I have seen children of theirs, of five or six years of age, attempt, nay, even execute, some of their steps so well, as almost to surpass belief. I once had the pleasure of seeing, in a remote part of the country, a reel danced by a herd boy and two young girls, who surprised me much, especially the boy, who appeared to be about twelve years of age. He had a variety of well-chosen steps, and executed them with so much justness and ease, as if he meant to set criticism at defiance; and, speaking of the colleges of Aberdeen, where he was long established as an elegant and accomplished teacher of dancing, he adds, 'they draw hither, every year, a number of students from the Western Isles, as well as from the Highlands; and the greater part of them excel in the dance; some of them, indeed, in so superior a degree, that I myself have thought them worthy of imitation.' After the toils of a long day, young men and women will walk many miles to enjoy a dance, which seems to have the effect of banishing fatigue, and, instead of adding to the sensation of weariness, it becomes really a recreation. This delight in dancing is diffused throughout Scotland, and the strongest efforts of the kirk to put down 'promiscuous dancing,' with the bitter reproofs of the more rigid covenanters, have failed in repressing the 'ungodly' exercise. The reel and strathspey are the dances common to all the Scots, and those of which they are most passionately fond. They are either a quartet or trio, 'a foursome or a threesome reel;' and those who are ignorant of this species of dance will find the principal steps used in it plainly described by Peacock, the intelligent writer already mentioned. It will be observed, that the difference in time between the two sorts of music produces a corresponding difference in the steps or evolutions. I shall here present the reader with a list of those most in use by the Highlanders. Ceum-siubhail, pronounced kemshoolle, the forward step, is the common step for the promenade or figure. Ceum-coi-

siche, or kemkossey, is the setting or footing step, and is divided into three sorts: first, where one step is equal to a bar; second, where two steps are required to a bar; and third, where two bars are required to a step. Ceum-trasad, or cross springs, are a series of Sissonnes. Siabadh-trasad, chasing steps or cross slips, is like the balotte. Aiseagtrasad, or cross passes, is a favourite step in the Highlands. Ceum-Badenach is another step much used, and requiring considerable agility. Fosgladh, or open step, and Cuartag, or turning step, are also very becoming movements. All these, and many more, are combined in one dance, and the association depends on the taste of the party. That called the back step, in which the feet are each alternately slipped behind, and reach the ground on, or close to, the spot occupied by the one just removed, is of difficult acquirement, and severely exerts the muscles of the calves of the legs. So much dexterity can some persons display in this, that they will go through the setting time of the music without moving beyond a space marked by the circumference of their bonnet. Sean triue, or old trousers, from the name of the accompanying air, is the native Highland hornpipe, and is danced with much grace. I have seen two brothers of the name of Grant, who were good violin players, exhibit feats of great agility. Part of their performance consisted of dancing the Highland fling, in that style called the Marquis of Huntley's, strathspeys over a rope, and gilli-callum over a fiddle-bow; and one of them danced a strathspey, played the fiddle, played bass on the bagpipe, smoked, spoke Gaelic, and explained it in question and answer, at the same time! Dancing among the Gael does not depend on the presence of musical instruments. They reel and set to their own vocal music, or to the songs of those who are near: people whose hearts are light and responsive to their native melodies, will find their limbs move in consonance to its music, however produced."

We might multiply these curious illustrations of ancient and traditional manners *ad infinitum*; but what we have given must suffice to shew the interest and value of Mr. Logan's researches. We have only to notice, that he is in error in stating the vessel found in the bed of the river Rother, a few years ago (p. 183), to have been Saxon: that was a mere newspaper illumination; and the ancient Saxon vessel was most satisfactorily proven to have been an old Dutchman.

Paris's Life of Sir H. Davy.

[Fourth Notice: Conclusion.]

ALTHOUGH we have already devoted a few columns in three successive Nos. to Dr. Paris's *Life of Davy*, we find some difficulty in bringing these remarks to a close.

With regard to the nature and theory of volcanoes, which has hitherto baffled the inquiries of all the most eminent philosophers in Europe, our author remarks:—

"A short time before Sir Humphry Davy quitted England, to which he was destined never to return, he communicated to the Royal Society a paper 'on the Phenomena of Volcanoes;' which was read on the 20th March, 1828, and published in the transactions of that year. The object of this memoir was to collect and record the various observations and experiments which he had made on Vesuvius, during his several visits to that volcano. It was a point of great importance to determine, whether any combustion was going on at the moment the lava issued from the mountain;

for this fact being once discovered, and the nature of the combustible matter ascertained, we should gain an immense step towards a just theory of the source of volcanic action. For this purpose, he carefully examined both the lava, and the elastic fluids with which it was accompanied. He was unable, however, to detect any thing like deflagration with nitre, which must have taken place had the smallest quantity of carbonaceous matter been present: nor could he, by exposing the ignited mass to portions of atmospheric air, discover that any appreciable quantity of oxygen had been absorbed. On immersing fused lava in water, no decomposition of that fluid followed; so that there could not have existed any quantity of the metallic bases of the earths or alkalis. Common salt, chloride of iron, the sulphates and muriates of potash and soda, generally constituted the mass of solid products; while steam, muriatic acid fumes, and occasionally sulphureous acid vapours, formed the principal elastic matters disengaged."

"He concludes this paper on volcanoes," says Dr. Paris, "with some observations on the theory of their phenomena; in which he remarks, 'it is almost demonstrable, that none of the chemical causes, anciently assigned for volcanic fires, can be true. Among these, the combustion of mineral coal is one of the most current; but it seems wholly inadequate to account for the phenomena. However large the stratum of pit-coal, its combustion under the surface could never produce violent and excessive heat; for the production of carbonic acid gas, where there was no free circulation of air, must tend constantly to impede the process; and it is scarcely possible, that carbonaceous matter, if such a cause existed, should not be found in the lava, and be disengaged with the saline or aqueous products, from the bocca, or craters. There are many instances in England of strata of mineral coal which have been long burning, but the results have been merely baked clay and schists; and it has produced no results similar to lava. . . . On the hypothesis of a chemical cause for volcanic fires, and reasoning from known facts, there appears to me no other adequate source than the oxidation of the metals which form the bases of the earths and alkalis; but it must not be denied, that considerations derived from thermometrical experiments on the temperature of mines and of sources of hot water, render it probable that the interior of the globe possesses a very high temperature; and the hypothesis of the nucleus of the globe being composed of fluid matter, offers a still more simple solution of the phenomena of volcanic fires than that which has been justly developed.'"

Dr. Paris very truly remarks, in reference to these investigations into the actual source of volcanic agency, "that he leaves us in doubt as to his own belief on the subject." But if the profound researches of a Davy were unable to unravel the mysteries of subterranean fires, after his having demonstrated the actual nature of the several alkaline substances, and carefully examined volcanic phenomena *in situ*, where shall we look for a solution of these stupendous geological phenomena? Whether we assume the chemical theory, or the igneous (or central) theory, the question appears to be equally beset with difficulties.

Dr. Paris relates, among others, an anecdote which is highly characteristic, both of the impetuosity of Buonaparte and of the well-known interest he always manifested respecting the encouragement of science during his brilliant career.

Speaking of the period when Sir H. Davy visited the French capital, he says:—"It is well known that Buonaparte, during his whole reign, was in the habit of personal intercourse with the savans of Paris, and that he not unfrequently attended the sittings of the Institute. Upon being informed of the decomposition of the alkalis by Davy, he asked, with some impetuosity, how it happened that the discovery had not been made in France? 'We have never constructed a Voltaic battery of sufficient power,' was the reply. 'Then,' exclaimed Buonaparte, 'let one be immediately formed, without any regard to the cost or labour.' The commands of the emperor were, of course, obeyed; and on being informed that it was in full action, he repaired to the laboratory to witness its effects. On his alluding to the taste produced by the contact of two metals, with that rapidity which characterised all his motions, and before the attendants could interpose any precaution, he thrust the extreme wires of the battery under his tongue, and received a shock which nearly deprived him of sensation. After recovering from its effects, he quitted the laboratory without making any remark, and was never afterwards heard to refer to the subject."

From Paris, Davy proceeded to the south of France and Italy by easy stages, visiting all the most distinguished persons, and carrying with him a portable chemical apparatus, so as to pursue his researches (in conjunction with his able assistant, Mr. Faraday) on all the various branches of chemical science that might arise during their continental tour. He continued from time to time to communicate the result of his researches to the Royal Society of London, and also the Institute of France, but which it would greatly exceed our limits to notice in our miscellaneous columns.

Our philosopher, besides inspecting Vesuvius and the adjacent volcanic districts (to the results of which we have referred) paid visits to Pompeii and Herculaneum, with the view of investigating the chemical properties of the colours employed by the ancients in their fresco paintings. On his return home, and during a tour in the north, he was applied to by Dr. Gray, the chairman of the committee of coal owners of the Tyne and Wear, to lend his valuable assistance in suggesting some means of preventing a repetition of the dreadful calamity which befell the unfortunate miners in the Felling colliery, near Sunderland, in the month of May, 1812.

As the researches of Sir Humphry Davy relative to the carburetted hydrogen gas, or fire-damp of collieries, which led to the invention of that beautiful contrivance, the safety-lamp, may be considered as the most important of all his chemical pursuits, so far as the interests of humanity are concerned, it may afford a degree of pleasure to many of our readers to give the following extract from the original letter of Davy to Dr. Gray, dated Melrose, August 3, 1815. "It will give me great satisfaction if my chemical knowledge can be of any use in an inquiry so interesting to humanity; and I beg you will assure the committee of my readiness to co-operate with them in any experiments or investigations on the subject. If you think my visiting the mines can be of any use, I will cheerfully do so. There appears to me to be several modes of destroying the fire-damp without danger; but the difficulty is to ascertain when it is present, without introducing lights, which may inflame it. I have thought of two species of lights which have no power of inflaming the gas, which is the cause of the

fire-damp; but I have not here the means of ascertaining whether they will be sufficiently luminous to enable the workmen to carry on their business. They can be easily procured, and at a cheaper rate than candles."

The merit of Sir Humphry Davy having been the original discoverer of a safety lamp for the use of the miners, having been contested by the friends of Dr. Clauny, and Mr. George Stevenson of the Killingworth colliery, Dr. Paris has thought it his duty to devote a large space to the investigation, and to give a detail of the progressive experiments of Davy, with the dates of the various communications to his scientific friends and the Royal Society.

Although the construction of the *wire-gauze* lamp was unquestionably the invention of Davy, we believe it is equally true, that a safety-lamp, with a flexible air-pipe, had been previously constructed by Dr. Clauny. As the first efforts of Davy were directed to the substitution of several air-tubes in lieu of one proposed by Dr. Clauny, and subsequently to the contraction of the diameter of these air-tubes, so as to prevent the passage of flame through them, in the event of an explosive mixture within, and, lastly, the substitution of fine wire-gauze for air-tubes,—it is, perhaps, only just to allow some portion of the merit to those who dig the foundation, instead of engrossing the whole honour for the architect, who subsequently erects the edifice. With regard to the invention of Stephenson, it could scarcely be termed a *safe* lamp, as the air was admitted through an aperture provided with a slide, so as to regulate the admission of the air at pleasure. But it is obvious, that a single aperture, or a few large apertures, which should admit air enough to maintain the combustion of the lamp, would, in the event of an explosive mixture forming within, communicate the flame to the inflammable gas without.

We cannot, however, commend the tone in which Davy's biographer speaks of the "Killingworth engine-wright,"—"a man who has perhaps effected more *practical* improvements in the construction of the steam-engine than any individual since the celebrated James Watt. It is only necessary here to mention the beautiful loco-motive engine, of this gentleman's invention, now working on the railway between Liverpool and Manchester, to rescue him from the charge of being "ignorant of the elements of chemistry."

Laying aside, however, the mere question of originality of ideas, it is highly gratifying to read the following testimony, collected by the indefatigable biographer of Davy, from Mr. Buddle, (one of the most intelligent practical miners in the kingdom,) in a letter from that gentleman, dated August 28, 1830, respecting the great value of this invention. "If the Davy lamp were used exclusively, and due care taken in its management, it is certain that few accidents would occur in our coal-mines. But the exclusive use of the 'Davy' is not compatible with the working of many of our mines, in consequence of their not being workable without the aid of gunpowder. In such mines, where every collier must necessarily fire on the average two shots a-day, we are exposed to the risk of explosion from the ignition of the gunpowder, even if no naked lights were used in carrying on the ordinary operations of the mine. As to the number of old collieries and old workings which have been renovated, and as to the quantity of coal which has been, and will be, saved to the public by the invention of the Davy, it is scarcely possible to give an account, or form any estimate. In this part

of the country, Walker's colliery, after having been completely worked out, according to the former system with candles and steel mills, and after having been abandoned in 1811, was re-opened in 1818 by the aid of the Davy, and has been worked on an extensive scale ever since, and may continue to be worked for an almost indefinite period. Great part of the formerly relinquished workings of Wall's-end, Willington, Percy-main, Hepburn, Jarrow, Elswick, Benwall, &c. as well as several collieries on the Wear, have been recovered, and are continued in work through the intervention of the Davys. If I had only time, I could write a volume on the subject. I shall shortly get an important paper on the subject of the Davy put into Dr. Paris's hands. Yours, &c."

Thus it appears that the researches of Davy have no less contributed to extend the amount of our national riches, than to serve the cause of humanity; and we fully agree in the subjoined remarks of Dr. Paris:—"The enlightened friends of science very reasonably expected that a service of such importance to society as the invention of the safety lamp would have commanded the gratitude of the state, and obtained for its author a high parliamentary reward; nor were there wanting zealous and disinterested persons to urge the claims of the philosopher: but a government which had bestowed a splendid pension upon the contriver of an engine for the destruction of human life, (Congreve's rocket,) refused to listen to any proposition for the reward of one who had invented a machine for its preservation. It is true that, in consideration of various scientific services, they tardily and inadequately acknowledged the services of Davy by bestowing on him the dignity of a baronetcy,—a reward that, it must be confessed, neither displayed any regard to his condition, nor implied the just estimate of his merits."

Our notice of this highly interesting volume might be advantageously extended to a far greater length, and especially in relation to what we have always deemed the most beautiful (considered in a purely scientific point of view) of all Davy's splendid discoveries—his electro-chemical experiments on the nature of the corrosion of copper sheathing by the action of sea-water. But the book can, with all our endeavours, be only slightly illustrated in our pages. In the end, when the Admiralty (1828) discontinued his plan, "the friends of Sir H. Davy saw, with extreme regret, that the failure of his mode of protecting copper sheathing had produced in his mind a degree of disappointment and chagrin, wholly inconsistent with the merits of the question; that while he became insensible to the voice of praise, every nerve was jarred by the slightest note of disapprobation."

His biographer then proceeds to trace the latter days of this distinguished individual. During the autumn of 1828 he took a second excursion to the continent for the restoration of his health; but in vain,—as, on his homeward way, death arrested his progress at Geneva. During his last tour, however, his active mind was fully engaged in writing a beautiful little work, appropriately entitled, "Consolations in Travel; or the Last Days of a Philosopher."

We can add nothing further, except a few words to recommend Dr. Paris's valuable "Memoirs" to every class of readers.

A Grammar of the German Language. By C. F. Becker, M.D. 8vo. pp. 284. London, 1831. Murray.

THE previous grammatical works of Dr. Becker,

i. e. his *Essay on the Formation of German Words*,* and his treatise, of a more universal nature, on the *Philosophy of Language*,† having justly excited a strong sensation among the philologists of Germany, we rejoice to see his third and most useful performance,‡ a *Grammar of the German Language*, skillfully translated and adapted for English students.

We perceive from many passages of Dr. Becker's productions, that he has long been an attentive observer of the great progress which the various branches of natural science have recently made, and that he has remained no stranger to the philosophical systems lately established in Germany. In his inquiries into language, his attention seems soon to have been more exclusively engaged by the structure of his own mother-tongue, over the history and successive development of which an important light had just been spread by the profound researches of the learned J. Grimm. But it was not till a rapid survey had made him acquainted with the peculiarities of most of the Indo-German languages, that he came before the public in the distinguished manner he has done. The volume now before us stands, in our opinion, not only above other German grammars, but also above those of any other modern language with which we are conversant. Notwithstanding the increased importance which has rendered an acquaintance with the languages of modern Europe now more than ever desirable to ourselves, it is but too certain that most of the grammars and elementary works, by means of which that knowledge is to be acquired, are far from the perspicuity and systematical arrangement which the present age is entitled to claim. Nor can we be at a loss to assign the cause for this general remark. Whilst the leisure of the professed philologists is almost exclusively occupied by the more learned study of the classical languages, and whilst to their endeavours we are already indebted for excellent Greek, Latin, and Hebrew grammars, the elementary works on modern languages are mostly written by men who, without a view to theoretical perfection, only vary in their attempts to facilitate the acquirement by what they call *practical* grammars. But while they systematically avoid entering into any thing like a philosophical elucidation of the laws of language, they often lose even that advantage which they profess to pursue; for in the same degree as they spare the learner the trouble of calling his intellectual powers into action, they must necessarily encroach upon his memory; and we may, in a great measure, look upon this perverse plan as the source of the dislike which so many young people entertain at the very beginning of the study of a foreign language.

A luminous arrangement is one virtue of Dr. Becker's work. It commences with an introduction, from a perusal of which we would promise much gratification, even to such linguists as do not intend to go through the whole of the plan. For the latter purpose it is essential to have become familiar with the general remarks laid down in these preparatory paragraphs. The main body of the grammar is divided into two parts, etymology and syntax: the former comprises two sections, 1. on the formation, and 2. on the inflection of words; the latter is arranged according to a manner peculiar to Dr. Becker, of classifying sentences as being either simple or compound, and as containing either a "predicative," or an "at-

tributive," or an "objective" combination of the subject with the other parts of speech that enter into it. At last, the rules for arranging words in a sentence are explained in a manner which renders this difficult point at once clear and easy. As a valuable addition, we must mention the tables which are appended to this grammar: they exhibit, as it were, the skeleton of the whole system, and contribute essentially to facilitate its study.

Dr. Becker's *Grammar of the German Language* may, in many respects, be compared with the description which a naturalist would give of any individual being of the vegetable or animal kingdom. He investigates the properties of its component elements, the vowels and consonants; he exhibits the various limbs or parts of which its body consists, and shews their proportions, their structure, and relative position; he even endeavours to lead us nearer to the principles of its action and life, by shewing how the functions of its different organs concur to one common end, which might be termed its vital process.

The difficulty of rendering the sense of German terminology into English is the chief obstacle which had to be overcome, and we think it has been surmounted as far as possible. Upon the whole, therefore, we must speak of this grammar (as every German critic has done) as a very valuable philosophical view of language, and an excellent guide to the study of German in particular.

The Planet. No. I. London, J. Nimmo.

A PRETTY little amusing miscellany, under this title, has just appeared in our periodical ranks. It is cheap, and contains some pleasing stories and anecdotes.

History of the Bible, Vol. II. National Library, No. VI. Colburn and Bentley.

THIS is the only one of the new Library volumes which has reached us, and we have just time to say that it does equal credit to Mr. Gleig with the first.

A Historical and Descriptive Guide to the Town of Wimborne-Minster, &c. &c. By the Rev. Peter Hall. 12mo. pp. 47. London, W. Pickering.

A BEAUTIFUL little volume, from the pen of the editor of the *Crypt*, whose works, we confess, have deserved much more attention from us than we have found opportunity to pay. The present publication does much credit to his antiquarian tastes; and besides being beautifully embellished, gives an excellent account of one of the most ancient and interesting Gothic structures in England.

A Series of Chemical and Medical Tables, forming a Synopsis of Chemistry, Materia Medica, Pharmacy, and Nosology. By John Hogg, House Surgeon and Apothecary to the Dispensary of the University of London. Taylor.

"THESE Tables," it is stated in a prefatory notice, "were compiled with a two-fold object in view,—to refresh the memory of the practitioner in the chief points of medical science, and to present to the student an outline of the professional field he is about to enter, as well as serve him with an easy source of reference in the course of his reading. The chemical analyses are chiefly those of Davy, Wollaston, Thénard, Thomson, Henry, Bostock, Brande, Berzelius, Majendie, Ure, Marcet, and Henderson. The *Materia Medica* and Pharmacy

* Deutsche Wortbildung. Frankfurt, 1824.

† Organism der Sprache. Frankfurt, 1827.

‡ Deutsche Grammatik. Frankfurt, 1829.

tables are chiefly on the authority of Drs. Cullen, Murray, A. T. Thomson, Paris, and Mr. Brande. The classifications of diseases are under the names of the three nosologists whose systems are adopted in this country,—Cullen, Good, and Willan."

We have no doubt that the methodical arrangement of these tables will render them eminently serviceable to the two classes of individuals for whose use they were principally intended.

American Stories for Little Boys and Girls, intended for Children under Ten Years of Age. Edited by Miss Mitford. 3 vols. 18mo. London, 1831. Whittaker, Treacher, and Co.

WHEN arranging another collection of American Tales, Miss Mitford found these stories, and considering them too good to be lost, she has kindly edited them for the benefit of a younger class of readers. There are few tasks more difficult than to write for children; for often, when endeavouring to inculcate a certain moral, there are such mistakes in the conduct of the story, that the incidental bad effects are likely to be far more injurious to the infant mind than the direct effects aimed at are calculated to do it service. We have looked at this series with these opinions, and we are glad to say, that if our *beau idéal* is not absolutely realised, we cannot detect any prominent errors.

Be it remembered, that we are talking thus in a vein of the deepest conscientious criticism,—that, we trust, the slight faults we, of long experience, see, might never strike the juvenile reader,—and that in truth these volumes have few errors which even fastidious objection could substantiate. We only, in one word, wish the editor were a mother.

Family Classical Library. No. XIII. THIS useful Library has just entered its teens. We regret that it does not come within the power of our limits to notice severally each number as it issues from the publishers. Were we disposed so to do, we must forego reviewing, and confine ourselves to advertising. Our silence, therefore, must not be interpreted as neglect of a work which we consider alike calculated to facilitate and promote classical information. The present number advances as far as the third volume of Tacitus. The version is that of Murphy. The numerous lost passages of the author, so much to be regretted from their disconnecting the train of historical events, are supplied; thereby rendering uninterrupted the best account of the times embraced in the narration. We shall, for the future, call the attention of our readers to *The Family Classical Library* only upon its commencing the translation of a new author.

The Northern Year-Book; or, Annual Register for the Counties of Northumberland, Durham, and Cumberland, for the Year 1829. T. and J. Hodgson, Newcastle; Simpkin and Marshall, London.

THIS, the first attempt to publish a provincial Annual Register, claims our notice as a literary novelty, and, what is better, our approbation as a very well-arranged and well-executed performance. The *Northern Year-Book* must be of great use in the North of England and South of Scotland; and some of its features, such as biographies, and reviews of local productions, little known to us *capital critics*, recommend it to more general circulation.

ORIGINAL CORRESPONDENCE.

NEW PHILOSOPHY: M. JOUFFROY.

To the Editor, &c.

Paris, 17th January, 1831.

SIR,—A primary object of your valuable Journal is doubtless that of co-operating in the discovery and diffusion of truth; yet was I greatly surprised to observe, in an instance within my own means of judging, that you have, in a late Number, most deeply, though unintentionally I admit, violated that sacred purpose. My regret, too, was equal to my surprise in finding that the invective of which I now complain calumniate a man possessing in an eminent degree not only high philosophical attainments, but, as it ought to be, the most estimable worth in the relations of private life. The animadversion to which I allude occurs in a note to your second notice of Stapleton's *Life of Canning*, in the Number for the 1st of this month, and is with reference to M. Jouffroy's present course of lectures at the Sorbonne.

It is with the hope of counteracting the injurious effects of the paragraph in question, both as respects the professor himself and the place where his lectures are delivered (which, like every public institution in this country, is nobly open to the public at large, without fee or gratuity whatever demanded or expected from those who choose to attend the different courses), that I take leave to address you. As you would not do an injustice knowingly, so you will, I am sure, be eager to repair that which you may, by imperfect or distorted information, have been led unconsciously to commit. My communication is prompted simply by a love of truth, and a sense of justice towards a man whose labours and talents both as a writer and professor are uniformly directed to advance the best interests of the human race. Strange perplexity in the life of man! to think that the able translator of Dugald Stewart and Thomas Reid should have been exposed in England to a defamatory attack on the moral tendency of his opinions! It is an attack, however, which I shall presently shew to be as groundless as it is harsh.

I have attended M. Jouffroy's lectures, with that intense interest which they are calculated to inspire, both from the importance of the subjects they discuss, and the charm imparted to them by a happy talent of ready, copious, and elegant extempore elocution. I am in the habit of taking notes during their delivery; and, although unable to clothe them with that grace of diction which marks the original, I can answer for the fidelity with which I have endeavoured to render the meaning and import of the subject.

If you re-peruse the article in the *Parisian Journal*, you will perceive that it is not a report of M. Jouffroy's lectures; but a commentary upon what the writer represents the meaning to be of certain points he has selected for examination, and which are made a text subordinate to an exposition of his own particular opinions.

You are aware, I doubt not, that a sect has lately sprung up here, and already counts a considerable number of disciples in the respectable class of society, the aim of which is to establish what they denominate, with perfect correctness, an entire new religion; but whether a better one, as they affirm it to be, will not so readily be conceded by those who still cherish that which the *Sacred Volume* teaches. From that volume, however, in making up their new creed, while they unceremoniously dismiss the essential articles of Christian faith, they take leave to borrow its moral attributes; and, by an adaptation of these after their own fashion, they loudly proclaim the indispensable necessity of reconstructing the frame of society and its institutions, upon a new basis, not only conformable, as they say, to the higher intelligence diffused among mankind, and since the period of the Christian revelation, but as supplying the only effectual and practicable corrective of the general suffering and agitation resulting, they allege, from the very advancement of knowledge, and its application in multiplying the products of industry. Their grand panacea for those evils is the very convenient one so long and so thanklessly advocated by the benevolent Mr. Owen, but without desiring to congregate the population into monotonous square buildings. A corollary they deduce from this disinterested partition of the goods of life among all mankind, and which constitutes the very ground-work of their system, is the amalgamation and identity of religion and government. The favoured instrument of this modern revelation was a certain Monsieur de St. Simon, who divulged his inspiration to the world some few years ago in sundry publications, which did not at the time attract much attention, but are now coming into notice, by the zeal and endeavours of its believers.

The *Parisian newspaper Le Globe* is the organ of this new sect; the *Saint-Simonians* and the article on M. Jouffroy's lectures is a professed answer to some remarks he took occasion to introduce, in allusion to the efforts of a body, whose writings and preachings, of considerable ingenuity and talent, are engaging public attention, and drawing crowded auditories to their Sunday meetings.

We insert this letter, though somewhat diffuse, not only as an act of justice, but as containing a curious, and we think interesting, exposition of sects which now occupy a great share of public attention throughout Europe as well as in France. We are glad to find that M. Jouffroy did not express, and does not hold, the opinions which *Le Globe* imputed to him.—*Ed. L. G.*

The article in question, then, reports him to have said—and you very properly point attention to so startling and objectionable a proposition—"There can be no religion to-day!" But one little word expressed by the professor is here omitted, which, when restored, imparts to this short sentence a very different meaning. M. Jouffroy's words were in effect—"There can be no new religion to-day." I do not impute bad faith to the critic by this omission; for he had, I apprehend, no other idea in his mind but that the discussion turned solely about a new religion.

Again, the brief passage in which that sentence occurs presents a remarkable instance of the distortion which the best principles may suffer when expressions are detached from the context, and the scope of the reasoning not kept in view. "That which distinguishes a religion," says M. Jouffroy, "is inspiration and certain forms"—a proposition which I doubt not you, Mr. Editor, are ready to admit; and when he goes on to affirm, that "reason is now emancipated, and it can do without these forms," when explained to be predicated of the forms, rites, and ceremonies, of the Catholic worship, a member of the Protestant or reformed church will not contend that they are necessary in France any more than in England.

So far from any thing in M. Jouffroy's discourses having even a tendency to "recommend to desperate characters, or young and hot heads, to start upon the fatal course" which you apprehend and justly deprecate, I will here quote from my notes one or two passages of his introductory lecture, which I trust may prove sufficient to convince you and your readers that so grave and injurious an imputation does not apply to that gentleman.

"In considering the nature of a human being," he observed, "we perceive that he is composed of two distinct parts—the vital or spiritual, and the corporeal. Death dissolves the union; but although the former disappears, can we affirm, that because only one of the constituent elements rests perceptible to our senses, the other is destroyed? The very circumstances of the phenomena lead to a doubt of such a result. What is the mental frame, the combination of intellect, which felt, thought, and acted, to become annihilated for ever, and the mere material atoms, its habitation, and instruments of its power, alone to remain! Humanity has ever rejected this belief; and through all ages, among all nations and people, man has always been prompted to ask, Whence do I come? What am I? Whither do I go?"

"Every religion, every system of philosophy, which does not resolve this grand problem, is defective."

"The Christian religion furnishes all the conditions necessary for its solution."

"Not to enlarge on the *Sacred Volume*, in which the great truths of that religion are revealed, they are so simple and clear, that the solution of the highest problem, the most wonderful mystery of creation, may be comprised in the compass of a few pages. It is found in that little tract, the Catechism, taught to children at school, where a few plain questions and answers resolve what has in vain exercised the meditations of the learned, and the researches of the philosopher."

Again—"In all countries, down to the present times, when the mass of mankind, absorbed in the vocations of daily life, providing for their physical wants and the gratification of their desires, or impelled by their passions, without leisure to inquire into their own nature and destiny, feel themselves uneasy by the means of subsistence and enjoyment being diminished, dissatisfied with their condition, they turn round and impute the ills inseparable from the actual state of humanity, to the institutions of the society in which they are placed. A love of destruction actuates them. How imperatively, then, is it the duty of the enlightened class of the community to inform themselves, and impart that knowledge to their less fortunate fellow-men, of the fundamental principle upon which alone all social union, all institutions, can rest firmly and durably."

"There can be no peace, no repose, no happiness, for individuals or nations, if governments, laws, and institutions, be not founded on that great, indispensable, and all-important principle—a knowledge of the final destiny of man."

Let I might, through the imperfection incident to hasty notes of an extempore discourse, fall into a mistake similar to that which it is the object of this communication to endeavour to rectify, I deemed it right to submit the foregoing quotations to the perusal of M. Jouffroy himself; and I have had the satisfaction of receiving his testimony to their substantial accuracy. It is my duty to add, that he felt extremely grieved on learning from me the cause of my application to him, "having," as he expressed himself, "certainly much at heart not to appear a desperate character in the eyes of *la noble nation Anglaise*."

It is superfluous for me, I am confident, to make any appeal to your sense of justice to induce you to find room for the present letter in one of your earliest Numbers.—I am, sir, &c. A. LOGAN.

ARTS AND SCIENCES.

CELESTIAL PHENOMENA FOR FEBRUARY. 12^h 14^h 58^m 30^s—the Sun will be eclipsed: invisible to the British Isles; visible to the northern provinces of South America and the whole of North America, in extensive regions of which it will be an interesting annular eclipse—at the

greatest obscuration the sun will appear as an intensely bright, yet exquisitely fine, ring of light, about 30" in breadth. 18^d 23^d 30^m—the Sun enters Pisces.

Lunar Phases and Conjunctions.

	D.	H.	M.
☾ Last Quarter in Libra.....	4	8	13
☾ New Moon in Aquarius.....	12	4	59
☽ First Quarter in Taurus.....	19	2	59
☽ Full Moon in Leo.....	26	4	50

The Moon will be in conjunction with

	D.	H.	M.
Mercury in Sagittarius.....	10	6	0
Jupiter in Capricornus.....	10	18	20
Venus in Aquarius.....	13	5	50
Mars in Aries.....	18	0	0
Saturn in Leo.....	25	11	10

Occultation of γ Tauri.—19^d—immersion 8^h 58^m, emersion 10^h 5^m. This star has been observed as if projected on the dark limb of the Moon from four to five seconds; a phenomenon which, though frequently occurring with Aldebaran, is solitary as respects its companion in the Hyades (γ Tauri): the only instance on record is the one just referred to, and was observed by Messier, March 24, 1757.

Lunar Eclipse.—26^d—the Moon will be eclipsed: partly visible to the British isles; visible from its commencement to its termination to the whole of Asia.

	H.	M.
Beginning of the eclipse.....	3	14 ^h
Middle.....	4	42 ^m
Moon's upper limb rises.....	5	15
End of the eclipse.....	6	11

Digits eclipsed 8^h 18' from the northern side of the Earth's shadow, or the Moon's southern limb. At the time the Moon rises above the horizon of Greenwich, about 7 $\frac{1}{2}$ digits of the disc will be in the Earth's shadow.

The eclipses of this month, just specified, will be visible in those parts of the world where their occurrence is connected with the most absurd and frightful ideas. The Mexicans, who will witness the solar eclipse, attribute the celestial phenomenon to the arts of magicians, who, by their enchantments, pluck the bright luminary from its radiant course. They strictly observe a fast, and their women cut themselves with knives and disfigure their persons. Others of them imagine that the sun and moon have wounded each other in a battle between them.

The Hindoos, who will witness the lunar eclipse, are also remarkable for their strange ideas. They say, that Rahoo, one of the *asooors*, stole a draught of the *amoceta*, at the churning of the ocean, and was discovered in the act by the Sun and Moon, who immediately revealed it to the *soors*. He was instantly cut in two by Narian; after which his head flew to the heavens, and continues to this day, endeavouring to eat the Sun and Moon, in revenge for telling of the theft. In 1797, during an eclipse, the servant of a missionary told him very seriously, that he remembered, when a boy, that Rahoo had swallowed the Moon; but the people made such a great shouting while he was getting the last piece into his mouth, that he was forced to let it go again!

7^d—Mercury stationary. 20^d—greatest elongation (26° 40') as a morning star. This elongation will afford a favourable opportunity of seeing this planet, owing to the angular distance from the Sun being nearly at its maximum. 23^d—in conjunction with Jupiter: difference of latitude 6'. 26^d 11^h—in conjunction with Uranus.

Venus is an evening star, but reserving her brightest rays of beauty and brilliancy for the vernal, summer, and autumnal eves: at present this planet is too near the Sun for satisfactory observation.

15^d—Mars in conjunction with α Arietis:

difference of latitude 3'. 24^d 14^h—with δ Arietis.

The Asteroids.

Ceres ..	1	19	10	S.D.	24	49	
9	19	23	24	40			
17	19	37	24	28			
25	19	49	24	13			

Jupiter is a morning star, but too near the Sun to be visible.

17^d 6^h 15^m—Saturn in opposition, near Regulus in Leo, and in its most favourable position for observation. There is every reason to conclude that a more vigilant examination of this singular planet by skilful observers, with exquisite instruments, would be amply repaid by extensive discoveries connected with its mysterious structure. It has only recently been observed that the ring is not concentric with the globe of Saturn, the orb being nearer to the western than the eastern side: from a mean of fifteen observations, by Professor Struve, it is found that the interval between the outer edge of the globe and the outer edge of the ring, on one side, is 11'' 073, and on the other side, the interval is 11'' 288; consequently there is an eccentricity of the globe in the ring equal to 0'' 215. It is suspected that the outer ring is separated by numerous dark divisions, extremely close to each other, exhibiting such an appearance as though the ring were formed of several small rings in the same plane. These divisions, which are occasionally very distinctly seen, are at other times not to be perceived, though the various circumstances connected with a favourable atmosphere continue the same. This has suggested the idea, that the outer ring has a very dense yet variable atmosphere, which occasionally intercepts or affords a view of these divisions. The external ring is not so bright as the internal; and the inner edge of the internal ring is less bright than the outer parts, and resembles the planet in colour: the edges of the rings appear to be rounded. In the year 1825, the ring of Saturn attained its greatest ellipticity; the proportion of the major to the minor axis was then as 1000 is to 498, the lesser being nearly half of the greater axis. Since that time, it has been slowly contracting: at present its axes are as 1000 to 160; and on the 29th of September, 1832, the plane of the ring will pass through the centre of the Earth, when the ring will be invisible to common observation, and only seen with superior instruments, as a fine line across the disc of the planet. On the 1st of December of the same year, the plane of the ring will pass through the Sun.

16^d 17^h—Uranus in conjunction with β Capricorni: difference of latitude 5'.

Deptford.

J. T. B.

THE COMET.

26^d 4^h 15^m to 6^h 15^m (Wednesday morning)—the comet is a little west of a right line connecting δ , ϵ , and ζ Ophiuchi, and nearly equally distant from δ and ζ : a telescopic star distant west about two diameters of the comet. It has a pale, nebulous appearance; is of an irregular circular form; no star-like nucleus, though a tendency to condensation is perceptible towards its centre. On the disappearance of the moon,

and before the morning twilight interrupted the observations, an extremely diluted tail was suspected, extending in a westerly direction, north of the telescopic star. The comet is visible only with the telescope.

28^d 6^h (Friday morning).—Notwithstanding the full moon, the comet was distinctly seen this morning, with the telescope; its central light was more sharp and twinkling than on the 26th. It formed the summit of an isosceles triangle with δ and ϵ Ophiuchi,—the comet west of the stars.

Deptford.

J. T. B.

ROYAL INSTITUTION.

THE present session bids fair to be an exceedingly interesting one. Amongst the professors of popular science who will take their place behind the lecture-table during the season, are the following:—Mr. Brande, on the chemical history and application of the metals; Mr. Vigors, ornithology; Mr. Ritchie, whose lectures last year on the photometer, night telegraph, nature and qualities of light, &c., gave so much satisfaction, has also been re-engaged for natural and experimental philosophy. Besides these, we shall have, after Easter, Mr. Montgomery, author of "the Pelican Island," &c., on poetry and the poets; Mr. Lindley, the clever botanist, on vegetable physiology and botany; and Mr. Willis, of Caius College, Cambridge, on sound. The subject of Mr. Faraday's course has not yet transpired. The theatre itself has been completely renovated, and presents a neat and comfortable appearance.

The first evening meeting for the session took place on the 21st; his Grace the Duke of Somerset in the chair. On this occasion Mr. Faraday delivered an account of a peculiar class of optical deceptions, in the development of which, he observed, he had been engaged during the summer months of last year. He illustrated his subject by numerous experiments on a large scale. *Ex. gr.*: If two equal cog-wheels be cut out of cardboard, placed upon a pin, and whirled round with equal velocity in opposite directions, instead of producing a hazy tint, as one wheel would do, or even as the two would if revolving in the same direction, there is presented an extraordinary appearance of a fixed wheel. Again, if one wheel move somewhat faster than the other, then the spectral wheel, as it may properly be denominated, appears to move slowly round. If the cogs be cut slantwise on both wheels, the spectral wheel in like manner exhibits slant cogs; but if one of the wheels be turned so that the cogs shall point in opposite directions, then the spectral wheel has straight cogs. If wheels with radii, or arms, be viewed when moving, then similar optical deceptions appear; and though the wheels move never so fast, yet the magic of a fixed wheel will be presented, provided they move with equal velocities. If they overlap each other even in a small degree, then very curious lines are seen. During a part of the evening, Mr. Faraday availed himself of a magic lantern, for the purpose of shewing a series of deceptions, as produced by shadows. Thus, with the two wheels mentioned, if only one is turned in the sunlight, a shadow corresponding to its appearance will be produced; but if both are turned in opposite directions, the shadow is no longer uniform, but has light and dark alternations, and resembles the shadow of a fixed wheel. Perhaps the most striking experiment of the evening was the following: it may be easily repeated:—A pasteboard wheel had a certain number of teeth, or cogs, at its edge; a little nearer the

centre was a series of apertures resembling the cogs in arrangement, but not to the same number; still nearer the centre was another series of the same apertures, different in number, and varying from the former. When this wheel is fixed upon another with its face held two or three yards from an illuminated mirror, and spun round, the cogs disappear, and a grayish belt, three inches broad, becomes visible; but on looking at the glass through the moving wheel, appearances entirely change; one row of cogs, or apertures, appears as fixed as if the wheel were not moving, whilst the other two give an opposite result; shifting the eye a little, other and new appearances are produced. Upon the table and in the library were other kinds of wheels and forms, some marked with dark lines, some coloured, and all tending to produce variations of the appearance. Mr. Faraday stated, that the combinations, as to form, colour, and other circumstances, were innumerable. We anticipate that a very popular and philosophical toy will be produced upon these phenomena. The lecture (the report of which, apart from the experiments, must be comparatively dry,) was well received by a numerous audience.

In the library, Mr. Cuthbert and Mr. Varley were present with their beautiful microscopes and wheel-animalcule, and illustrated some of the applications made by Mr. Faraday in the theatre. Mr. Pepys placed on the table a metallic thermometer, by Bregnet, of exquisitely fine construction; and also an interesting specimen of glass-casting, from America. It is a plate, with a highly finished design of scroll foliage, relieved as beautifully as if it had been cut, although of a pattern and execution which could not be obtained by the glass-cutter's wheel. There were also placed on the table many presents in literature and natural history.

In the course of the evening, Mr. Faraday very impressively noticed the increased interest manifested by the members, and earnestly called upon them not to relax in their endeavours to aid the committee of the Institution,—a feeling which found a willing response in the plaudits of the company.

ACOUSTIC CHAIR.

THE science of acoustics, in a practical point of view, has been strangely neglected in this country, and, in fact, in modern times generally. The ancients appear to have been better acquainted with the doctrine of sounds, and to have applied it to more useful purposes, than ourselves; for we learn that Dionysius, the tyrant of Syracuse, had a cavern excavated in a rock, in the shape of the human ear, (which is of course best adapted for the reception and transmission of sounds) in which he confined his state prisoners, and by tubes leading from it to his chamber, he was able to catch even their softest whisper, and thus to discover their designs, &c. This idea seems to have been lost sight of till now, when we are agreeably surprised to find that Mr. Curtis, the well-known aurist, has invented a Chair, with an acoustic barrel and tubes, something on the principle of the Invisible Girl, for the benefit of the deaf, and for old persons who are hard of hearing, and who, while sitting in it at their leisure, may hear conversation or reading in a low tone of voice, carried on by an individual in any part of the room. By means of pipes, also, a person whispering in a distant apartment can be distinctly heard. We have ourselves been seated in it, and were astonished at the ease with which we distinguished the different voices of those engaged in conversa-

tion in an under tone, and also a tune played by a small musical box, (which was as audible as if it had been standing on a table before us), in a room separated by a hall, &c. from the one in which the chair is placed. Upon the whole, we consider this invention as one of the most ingenious applications of the principles of acoustics with which we are acquainted.

LITERARY AND LEARNED.

ROYAL SOCIETY.

GEORGE RENNIE, Esq. V.P., in the chair. A paper by Mr. Barlow, on the probable electric origin of all the phenomena of terrestrial magnetism, with an illustrative experiment, was read. James Henderson, Esq., his Britannic majesty's consul at Bogota, was proposed. Among the presents were the Conn. des Tems and Annuaire from the Bur. des Long. at Paris, and the first Bulletin of the Statistical Society of France.

SOCIETY OF ANTIQUARIES.

THURSDAY, W. R. Hamilton, Esq. in the chair. Several members, lately elected, were admitted. H. Brandreth, Esq. exhibited an ancient seal, found in the ruins of a monastery at the Lyde, near Princes Risborough, Bucks. The Secretary read a communication from A. J. Kempe, Esq. (accompanied by three drawings), descriptive of a cromlech at Cwyn Bryn, about ten miles from Swansea, an immense mass of granite, surrounded by a vallum of loose stones. In the neighbourhood of this cromlech is a village called Lychar, the Lucarum of Antoninus. A paper was also read from F. Madden, Esq., being a translation of an account of a visit to England by a Spanish nobleman, the Duke of Nagera, in 1543-4, written by his secretary. This account gives a minute description of the several towns in Flanders and England through which the duke passed on his way to London, and informs us that he could not get to Dover by land, on account of the insular situation of England. The writer gives a glowing description of London, the castle (the Tower), and the king's palace; but was very indignant at not being admitted with his master into the king's presence, and he therefore abuses his majesty in good round terms. He was, however, admitted to the presence of the queen, and kissed her hand. He requested permission to salute the hand of the Princess Mary, which she would not allow, but said he should kiss her lips; and the lucky secretary states that he kissed the Princess Mary and the rest of the ladies of the court. In describing the Tower, he says he saw, besides four great lions, seven large bears, which were every day brought into an enclosure, and tied to a long rope, and that they turned large and strong dogs upon them, which afforded good sport; and that a pony was turned in, with a monkey tied on his back, who kicked and pranced about among the dogs, with the affrighted monkey clinging to his ears. Such were the sports of our ancestors!

FINE ARTS.

BRITISH INSTITUTION.

THE first exhibition of the season, that of the British Institution, is to be opened to the public on Monday next. We have been favoured with a view of it; and we are happy to say that, if it does not surpass all its predecessors, it nevertheless contains a number of works of high excellence, and which, especially in the familiar walks of the art, do great honour to the English school.

Some eighteen or twenty years ago, we dropped into the British Gallery one morning, during the period of the year at which it has always been liberally appropriated to the use of students. Of those students the venerable Mr. West, the then president of the Royal Academy, condescended to be one, and employed himself in making a fine copy of Vandyke's celebrated head of Govartius. Although there were sixty or seventy artists of different ages and sexes in the rooms, yet they were all so, tranquilly and intently engaged in their various studies, that it sometimes happened that not a whisper, or a sound of any kind, could be heard for half an hour together. At length, evidently affected by this singular stillness, Mr. West turned from his easel, and, in his mild but sufficiently audible voice, exclaimed, "How unlike is this scene to Lloyd's coffee-house!" Brief as the remark was, its force and its dignity were felt by every one. But it is with the contemplation, as it is with the practice, of the fine arts; nothing has a greater tendency to withdraw the mind gently, but irresistibly, from vulgar, worldly, and agitating thoughts: and if a time can be imagined at which occasional recourse to such a mental sedative must be more than usually beneficial, it is, surely, the present; when the whole globe is in so convulsed a state; when the din of politics is incessantly ringing in our ears; and when the foreign and domestic events of every day are of a nature to disturb the calmest and most philosophical breast.

A large proportion of the productions of the pencil which now decorate the walls of this gallery, have come under our notice on former occasions.* Among those which appear to us to be novel works, some of the most striking are—*Lavinia*, by Sir Martin Archer Shee, P.R.A.; *Too hot*, by E. Landseer, A.R.A.; *Going to Mass*, by S. A. Hart; *Part of the Corn Market at Caen*, by D. Roberts; *A Lion at rest*, by J. Northcote, R.A.; *Gleaners*, by W. T. Witherington, A.R.A.; *A Nutting Party*, by W. Collins, R.A.; *L'Allegro*, by A. Chalon, R.A.; *The Toilette*, by G. S. Newton, A.R.A.; *Amiens*, by C. R. Stanley; *Sketch of a Subject for an Altar-piece—Martyrdom of some of the early Christians*, by W. Etty, R.A.; *The Temptation of St. Anthony*, by Fraser; *The Fair Day, The Culprit*, and *Guy Fawkes*, all by Webster; *The Pedlar*, by Knight; *A Hurdy-gurdy Grinder*, by Morton; several subjects by Kidd; *Captain Macheath*, by H. Leverseege; *The Tame Canary*, by R. Edmonstone; *Children and their Pets*, by T. Woodward; *Falstaff's Assignment with Mrs. Ford*, by G. Clint, A.R.A.; *The Spring Noss-gay*, by Mrs. Carpenter; *Landscape—Moonlight*, by T. C. Hoffman; *View in the Wood at Bromley Hill*, by F. R. Lee; *A Sketch*, by T. Creswick; *The Advertisement*, by T. Clater; *Children playing at Cards*, by W. Gill; *A View in Hampshire*, by Miss H. Gouldsmith; *Cavalry attacking a Battery of Guns*, by T. Barker; *Servant Girl at Antwerp*, by H. Howard, R.A.; *Interior of the Painted Hall at Greenwich Hospital*, by J. Scarlett Davis; *The Signal*, by H. P. Parker; *The Sleeper*, by A. Morton; *High Life and Low Life*, by E. Landseer, A.R.A.; *Cattle*, by T. Linnell; *The Forum of Nerva*, by G. Jones, R.A.; *The Highland Cradle*, by E. Landseer, A.R.A.; *The Trumpeter and Ware Hare!* by A. Cooper, R.A.; *The bitter Morning*, by R. W. Buss; *Mercury playing Argus asleep*, by B. R. Haydon; *Preparing for the Portrait*, by T. Clater; *An Arabian Mare and Foal*, by J. Ward, R.A.;

* Which we much regret, as it indicates the works remaining on the artists' hands.—*Ed. L. G.*

The Ford, by J. A. O'Connor; *Worthing Sands*, by F. W. Waits; *The Lame leading the Blind*, by C. Hancock; *An Interior of a Picture Gallery*, by P. C. Wonder; *Raphael introduced by his Father to the Duchess d'Urbino*, by W. Brockedon; *The tired Model*, by R. T. Lonsdale; *Ullswater*, by T. C. Hoffman; *The Taming of the Shrew*, by Miss Alabaster; *The Fox caught*, by T. Clater; *Jewellery*, by G. Lance, &c. &c. &c.

In our next, and subsequent numbers, we shall enter more into detail on the subject.

NEW PUBLICATIONS.

Scrapes and Sketches. Part III. Designed, etched, and published, by G. Cruikshank.

Six plates, comprehending above forty subjects, most of them of the most whimsical character. No description can do them the slightest justice. We can only mention a few of those which affected our risible faculties the most forcibly. One of our prime favourites is a stage-coach loading, inside and out, with passengers, every one of whom might rival Daniel Lambert in dimensions. The horses—as remarkable for their sparseness—are eyeing the monstrous bipeds with consternation. "This is really too bad!" neighs one; "Where is our friend Martin?" asks a second; "I shall kick at it," exclaims a third. The whole forms an excellent composition. "Round text and small hand" is capital. From the pocket of "an oilman of God" a scarecrow of a raggamuffin is slyly withdrawing a "vipe." Two plates devoted to the illustration of "Comforts" of every kind tell admirably; especially the central group of one of them, entitled "A man with all his little comforts about him." The power which Mr. Cruikshank possesses of composing shapes resembling the human, with the most grotesque materials, is well known; and was never exemplified in a more extraordinary manner than in one of the plates of the series, consisting of bellows, grates, fire-irons, tea-kettles, &c., and abounding with the most forcible and farcical expression. Two or three serious subjects serve as a contrast to the majority. Of these, "An African Settlement" is but too strikingly true. It represents a churchyard, with a number of tombs, on which are the inscriptions,—"The Barracks," "The Castle," "The National School," "The Orphan Asylum," "The Hospital," "The Rectory," &c. But we must refer our readers to the publication itself, which affords an additional proof of this inimitable caricaturist's inexhaustible invention.

Views of Kenilworth Castle. Ebers and Co. LITHOGRAPHY appears now to be capable of any thing. These four small views (on one sheet) are sweetly executed. The omission of the frames would, we think, have been an improvement.

Priam, the Winner of the Derby Stakes at Epsom, in 1830. Painted by J. Fernelley, engraved by E. Duncan and J. Webb. R. Ackermann, jun.

Velasquez, Winner of the St. Leger, Spring Meeting, 1828; rode by W. Scott.

THE animal next to a beautiful woman in beauty is a beautiful horse; and others besides the sporting world must be highly gratified by the publication of such symmetrical and correct portraits as these are of creatures at once gifted with so much grace and such extraordinary powers. The exploits and fame of both Priam and Velasquez simply entitle them to the honours of art; and they are so extremely well painted

and engraved as to be quite admirable ornaments of their class.

FRENCH EXHIBITION.

THE exhibition of the works of the French artists will commence on the 1st of April next, at the Louvre. The pictures are to be received from the 15th of February to the 15th of March.

DRAMA.

WE have observed with great attention the progress of the dramatic suit now before the Lord Chancellor, and can no longer control the expression of our surprise at the perfect ignorance manifested by the learned counsel on all sides with regard to the real, important bearings of the case. The mere legal technicalities set apart, they positively know, or affect to know, nothing of their own case or of their adversary's; and the answers returned to the probing questions of his lordship have been simple enough to convulse all the scene-shifters in London with laughter. Their blunders have, however, let out the truth sufficiently for all the world to see that it is merely a scramble amongst the parties for what they can get. Popular feeling is indubitably against the monopolists; but we have our doubts, whether the granting Mr. Arnold a license to play opera all the year round would not be killing him with kindness, as he would have to fight both the great theatres single-handed, if they choose to play opera also,—ay, and the Haymarket to boot; as of course Mr. Morris must have his license extended, and he, it is notorious, would play—the very devil—sooner than suffer the Lyceum to gain an inch of ground in public estimation that could be disputed. Thus, then, we should most probably have four imperfect opera companies, in lieu of one truly effective; for a complete corps cannot be made up, unless each theatre yield its treasures to the general stock. The whole, or very nearly all, are absolutely required for the effective performance of a grand opera, and would be no more than is enjoyed by nearly every capital in Europe, from Berlin to Naples.

Is there not a way, then, to cut the Gordian knot which is at present strangling the Drama, the line being pulled at both ends by these terrible limbs of the law? We will venture to put a little penknife into the hands of the Lord Chancellor, and humbly suggest his using it in the following manner. It is a standing joke against the winter theatres, that they keep their doors open to the beginning of July, leaving the summer theatres but three months out of the twelve, with the town empty, the dog-star raging, the shooting season commencing, &c. &c. &c. What if his lordship now should, with the little penknife aforesaid, slip off the months of May and June from the winter theatres, and order them to be tacked on to the licenses of Messrs. Morris and Arnold, dividing the year thus fairly between the four principal metropolitan theatres? The loss would not be felt by the winter houses; they would, indeed, become more vigorous by the pruning, for little good is ever done by them after Easter; and the late falling of that movable feast would occasionally save them the enormous expense of the spectacle annually exacted by the holiday-makers; while, on the other hand, a six months' season would enable the proprietors of the Haymarket and the English Opera House to offer handsome engagements to the best performers, and yield them sufficient opportunity to profit

largely by a hit, if they were lucky enough to make one. At the same time, we would also respectfully hint the propriety of laying down some new and plain rules and regulations for the minor theatres to abide by; and instead of limiting their numbers, and winking at their evasions of the law and their abuse of their licenses, of abolishing the indefinite term burlesque, which, as now interpreted, means any thing and every thing, and permitting any respectable persons to speculate in theatricals, as well as in beer, provided always they brew for themselves, and leave untouched the malt and hops of their neighbours.

DRURY LANE.

ON Monday, Macready, in *William Tell*, gave us one of those perfect personations which truly elevate the stage, and teach us really to regard the histrionic art as eminently deserving of admiration. The daring manliness and bold patriotism of the Swiss mountaineer were embodied in all the force of reality; nor were the feelings of the father, in contrast with these sterner attributes, less happily portrayed. It is a splendid performance, as full of nature as of energy and force; and produced a very powerful effect on a crowded auditory. A little Miss Poole played the son admirably. Whether from the general tenour of the play harmonising with the liberal feelings of the day, or from the enthusiasm excited by the power of the actor, the piece was received with "immense applause." Macready was clamoured for, to make his re-appearance and bow, and promise to do so again. This custom of having forward an actor to receive sentence, is of somewhat ancient date. The Athenians were wont to compel any unfortunate "artist" who incurred their disapprobation to re-appear, when hisses, hoots, nuts, crusts, and apples, were showered upon him in profusion: nor was this deemed sufficient, unless he took off his mask,* that the benevolent audience might enjoy his confusion and distress. As yet we have not arrived at this, but content ourselves with imitating the *claqueurs* of Paris.

On Tuesday *The Jealous Wife* was acted with, upon the whole, indifferent success; though some of the parts were strongly cast. The second page of the play-bills of this theatre has been quite a curiosity during the week, no fewer than seven puff announcements following consecutively. For example, 1. Mr. Alexander Lee has prevailed upon Mr. Kean to forget his last farewell at the Opera House, and play again to a London audience for fifty pounds a night! 2. Lord Byron's (query, Macready's?) *Werner* will be played twice a week. 3. *The Jealous Wife*, and all the popular names paraded. 4. *The Brigand* and the *Pantomime* having again attracted crowded benches, an early application for places is respectfully advised. 5. *Fra Diavolo*, adapted by Mr. Alexander, is announced. 6. For the accommodation of the juvenile classes, the *Pantomime* is to be played at an early hour. 7. The immense overflow to *William Tell*, is stated as a reason for repeating that piece.

* We have heard the introduction of masks recommended for the consideration of our theatrical patentees, for the same reasons as they were used at Athens. Primarily, because they answered the purpose of a speaking-trumpet: this might obviate the present inconvenience under which the majority of the audience labour, namely, that of not hearing above one word in ten. Secondly, the *beau idéal* of the characters might be physiognomically preserved. For instance; a set of masks might represent Shakespeare's lords of Westmoreland, Northumberland, and "others of the council;" and thus the ancestry of the aristocracy be no longer brought into contempt by the pug of a scene-shifter, or the bottle-nose of a candle-snuffer.

Surely, this sort of thing is unbecoming of a national theatre! With so many attractions, one can only wonder how the manager contrives to find nights enow in the week for their representation.

ADELPHI.

THIS theatre should, for distinction, be called *Theatre Royal*, for we have not only had the "King of the Cats" all the week, but the "King of the Alps" also. This "serio-magical burletta" is taken from a German drama of the same name, translated by Lord Stanhope, we believe, and adapted for the Adelphi by Mr. Buckstone. The plot is singularly wild; and consists of the interference of the Alp-King, *Astragalus* (Mr. Yates), to reclaim to humanity *John Rappelkoff* (Mr. Mathews), a suspicious and intemperate misanthrope, who, disgusted with his kind, has retired to a Timon-like seclusion. The opening out of the story is long; but it grows in interest, and the last scenes are very striking. In these the Alp-King has assumed the form and nature of the misanthrope, and forces him to witness the freaks and madness of his own double, in the shape of his brother *Siberkraut*; by which means he is brought to perceive the errors of his disposition and life, and to return, an altered man, to the bosom of his family. The illusion is rendered complete by Yates's masterly imitation of Mathews. It is really difficult to tell which is the real *Rappelkoff*! Mathews's performance, too, is of so high a cast as to make its copy no easy task; and the effect altogether is astonishing. An underplot introduces Reeve as *Glow-worm*, a charcoal burner; and O. Smith, as his dumb cousin. Both parts are played as well as possible: and when we add, that other characters are sustained by the ever-delightful Mrs. Yates, by the lively Mrs. Fitzwilliam, by Miss Daly, Miss Barnett, Buckstone, Hemmings, &c. &c., that the scenery is remarkably picturesque, and the supernatural portions striking, we need scarcely say that we have a misanthrope, strange as it may appear, likely to be very much liked.

OLYMPIC THEATRE.

The Grenadier, a burletta by Mr. T. H. Bayly, has been added to the entertainments at this theatre since our last. It is a lively sketch of the "perfection" class, and its principal object the introduction of Madame Vestris in various characters. As a *Savoyard Boy*, with a real organ and a real monkey, she sings a real Savoyard song in her own unequalled style, amidst roars of laughter and applause. Mr. Fredericks bustles through the part of her jealous admirer with sufficient spirit; and Miss Pincot and Mr. Raymond, as the humble servants of the masquerading pair and of each other, are all that the author or audience can wish them. M. Spagnoletti is nightly improving; and Miss Sydney (Stubbs, we believe) is deservedly a favourite. There is a Mr. Collier at this theatre, whose comic acting and singing are of a very superior order. He reminds us of Knight, but has a better voice, and is a good musician. We are delighted to welcome such strangers, and there are others in the Olympic company who improve vastly upon acquaintance.

VARIETIES.

New Species of Elm-tree.—Mr. David Thomas describes, in *Silliman's American Journal* for 1830, a new species of elm, under the name of *ulmus racemosa*. Its specific cha-

acters are, flowers in racemes; pedicles in distinct fascicles, united at their bases. It is a tree, and its lower branches have irregular corky excrescences. It is a native of the Cayuga Country, in the state of New York, and of the adjacent country.

The Comet.—Mr. Herapath has published another letter on the comet in the *Times*; but it throws no new light on the subject; unless it can be considered a discovery to be told, that "it is either between us and the sun, or on the other side of the sun!!"

Tiflis.—A reading-room and library has just been established at this distant watering place. It already possesses two newspapers, one of them in the Russian language, which appears twice a-week, under the title of *Gazette of Tiflis*,—the other in Persian, and published daily.

New Town of Piatigorsk.—A new town has been organised in the neighbourhood of the mineral waters of the Caucasus. It is to be called Piatigorsk, and the tribunals established at Gueorgievsk are to be transferred thither, with the exception of the tribunal of conscience (*souvéstnoi soude*).

Botany.—The botanist attached to a recent scientific expedition from Russia to the Brazils, has brought from Rio Janeiro, for the Botanical Garden at St. Petersburg, a collection of above a thousand living Brazilian plants, as beautiful as rare; and among which are many which have never hitherto been seen in Europe. This rich acquisition, joined to the young plants which the garden has already obtained from Brazilian seeds, will soon be sufficient to fill a large green-house, where the lovers of botany, in the 68th degree of north latitude, may form an idea of the beauty and variety of the Flora of a vast country situated between the tropics.

Wirttemberg.—On the 1st of November, 1827, the population of the kingdom of Wirttemberg amounted to 1,517,770 persons; of whom, 1,055,132 professed the evangelical, and 462,857 the Catholic religion: 9,100 were Jews; and 463 Mennonists and Herrnhuters.

Singular Death.—In January, 1777, died John Ross, LL.D. professor of languages in the King's University of Aberdeen. His death was occasioned by swallowing a spider in a glass of claret. Upon dissection, his stomach was found to be much ulcerated, and distended beyond the usual size.

Devo.—The annual average quantity deposited in this country is estimated at a depth of about five inches, being about one-seventh of the mean quantity of moisture supposed to be received from the atmosphere over all Great Britain, in the year; or about 22,161,337,355 tons, taking the ton at 252 imperial gallons.

Geological Map of Germany.—Professor Frederic Hufmann (now in Berlin) has projected a geological map of the north-western part of Germany, in twenty-four leaves. This beautiful map contains the countries between the Elbe and the Rhine, and from the Thuringia mountains to the great plain north of Hanover: with all details in the limiting of the rocks, it is without doubt the best that exists, and better than the great map of England by Greenough and Smith. A general geological map of the above countries, accompanied by sections and a "geological description" of that part of the country, in three volumes, also by Professor Hufmann, will appear soon; and the whole will form one of the most important geological works. It may be recommended to the British geologist on account of the formations of Germany being similar to those in England.

Seleniuret of Silver.—This mineral is now

found in greater massive specimens at Tillerode, in the Harz, according to the method of Professor Milscherlich, from the seleniuret of lead, in very great masses, and sells in the mining factory at Harzgerode for four louis-d'ors the ounce.

Zinkenite.—The system of crystallisation of the zinkenite from Wolfsberg, in the eastern Harz, is prismatic, and not rhomboidal—so at least states Dr. Hartmann in opposition to Mr. Haidinger, *Library of Useful Knowledge*, who makes the crystals rhomboidal.

Culture of Silk.—The culture of silk goes on prosperously in the state of New York; and Dr. Pascalis writes, that the accounts are flattering from every quarter of the Union:—"At the next fair of the Institute, I shall be able," he says, "to exhibit a great number of domestic silk productions in the highest perfection." The tree that is planted is the Chinese mulberry, *morus multicaulis*. This plant can be propagated with astonishing success. It is even probable that two crops of silk may be obtained in one season.

Cholera Morbus.—Great apprehensions are entertained at Trieste, on the subject of the possible importation of the cholera morbus by Odessa vessels. It has been remarked, that a great mortality prevails among the poultry; a circumstance which preceded the invasion by cholera of Taganrog.

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. V. Jan. 29.]

In the Press.—A work on the Principles of English Composition, is announced by Mr. Booth, the Author of the "Analytical Dictionary."—An Outline of Sematology; or, an Essay towards establishing a new Theory of Grammar, Logic, and Rhetoric.—A Series of Eight Views in Kensington Gardens, including the Royal Palace, and other Picturesque Points, from Drawings by Mr. I. Sargeant, engraved in the line manner, by Mr. Henry Wallis; with Topographical and Historical Illustrations.

LIST OF NEW BOOKS.

Stebbing's Lives of Italian Poets, 3 vols. post 8vo. 12. 16. 6d. bds.—Mayor of Garratt, 12mo. 1s. 6d. sewed.—Howitt's Book of the Seasons, 16mo. 10s. 6d. bds.—Raphael's Lady-Witch, 12mo. 8s. 6d. bds.—Art of Tormenting, coloured, 12s. 1 plain, 6s. sewed.—Spirit of Don Quixote, royal 8vo. 10s. 6d. bds.—Siamond; the Battles of Cressy and Poitiers, on Lock's plan, 12mo. 2s. 6d. bds.—Affair at Charlton Holt, 12mo. 4s. 6d. sewed.—Crum on Primary Colours, royal 8vo. coloured plates, 5s. 6d. bds.—Dewar on the Atonement, 12mo. 7s. 6d. bds.—Erskin's Brazen Serpent, 12mo. 2s. 6d. bds.—Le Bas's Life of Bishop Middleton, 8 vols. 8vo. 12. 6s. bds.—Siamese Twins, 8vo. 14s. bds.—Views in the South of France, &c., folio, India proofs, 2l. 2s. hf.-bd.—Thackrah on Employments as effecting Health and Longevity, 8vo. 3s. 6d. bds.—Spitzer's Elements of Greek Prosody, 8vo. 6s. sewed.—Goettling's Elements of Greek Accentuation, 8vo. 5s. sewed.—Martyn's Analysis of the Calendar, 12mo. 5s. 6d. bd.—Bloomfield's Manual of Family Prayers, 8vo. 4s. 6d. bds.

CHARLES H. ADAMS.

TO CORRESPONDENTS.

* A pressure of matter in other departments of our Journal obliges us, unwillingly, to postpone reports of the Royal Society, Society of Arts, Royal Geographical Society, and various other Papers of interest, intended for insertion this week.

What a "Young Foreigner" suggests, would cost us several hundred pounds a-year in duties; and the information is always to be found in other parts of the *Gazette*. T's lines on Consumption are not sufficiently correct in their rhymes.

To W. H. C.—Political poetry is not in our way.

ADVERTISEMENT,

Connected with Literature and the Arts.

DAILY INSTRUCTION.—A LADY, who has been regularly educated, wishes to devote a portion of her time to the instruction of Pupils at their own Residence, in English, French, Geography, History, Music, and Drawing, with Writing and Arithmetic. Distance must not exceed Two Miles from Kensington Cross.

Unexceptionable references will be given, on application to the Publisher.

MESSRS. LONGMAN and Co. have a VACANCY for a well-educated Youth as an Apprentice, to be bound for Seven Years, and be boarded and lodged in the House during that period. A Premium will be required. No. 29, Paternoster Row, Jan. 20, 1831.

TO BOOKSELLERS, STATIONERS, and PRINTSELLERS. To be disposed of, an old established Business, in one of the first Cities in the West of England. The Premises are of the most complete description and fitted up in a superior style; the Stock modern, and of the best selected description. Parties will be treated with on the most liberal terms. Further Particulars may be known (if by letter, post-paid), of Mr. Waller, Literary Saloon, Cheltenham.

THE NATIONAL LIBRARY.

Edited by the Rev. G. R. LEBIG, M.A.
The Proprietors of this work feel themselves stimulated to fresh exertion by the distinguished favour with which it has already been received.

The volumes of the National Library already before the world may be confidently appealed to as proof of zeal on the part of the Proprietors, to engage with regard to expense, the assistance of writers of high celebrity, and to present to their readers a series of productions, which, as they are connected, not with ephemeral, but with permanent subjects, may, years hence as well as now, be considered for lively amusement as well as for solid instruction. The Life of the illustrious Byron, by Mr. Galt, who was personally known to the poet, has been stamped by the voice of the public with the character of a standard work, authentic in particular, and dispassionate in judgment. That it should have met with opposition from some quarters, was an inevitable consequence of the task, and the very name of Byron conjures up at once a host of angry distant, who, having each his own theory to support, cannot all concur in the statements and opinions of the biographer, be these what they may. The memoir in question has, however, been so fortunate as already to rise superior to its assailants.

In speaking of the Rev. Mr. Gleig's History of the Bible, it has been said in a contemporary journal, (*Literary Gazette*), that "it would be some ground of reproach to the friends of truth, if they had entirely neglected the new species of monthly publications as a means of diffusing religious knowledge among the higher and middle classes of society; and the present volume shews, in the happiest manner, how well they are adapted to convey that knowledge which makes faith more sure, and piety more enlightened."

The History of Chemistry, which forms the third volume of the National Library is from the pen of the learned Dr. Thomson, of the University of Glasgow, who, in recording the wonderful incidents and effects on society which marked the progress of chemistry—in telling of the strange lives of its early students, (the alchemists and others), and in describing at full the useful labours and discoveries of more recent times, has written a book which, while it is characterised by scrupulous truth, and by practical information in every part, possesses much of the attraction of romance.

The remaining volumes of those hitherto published, are occupied by the History of Events and the Crusades, by G. F. R. James, Esq.; and Festivals, Games, and Amusements, Ancient and Modern, by Mr. Horace Smith, which latter is just issued to the public. Of the character of the former subject, in an imaginative point of view, and of its great utility in illustrating the annals of European history, it is needless to speak, while as regards the present author's trustworthy nature, the terms of "Richelieu" and "Darnley" have, no doubt, from its first announcement, formed high expectations, which, it is hoped, have now been fulfilled.

To these, many other original works, of a class which seems of essential value to the English Nation, are in the press, and will immediately succeed; among which may be mentioned, "History of the Royal Navy of England, from its first existence; and that of the British Army and its Services."

Such are the principal features of the National Library, as far as it has already proceeded; and the nature of some of those who are in the press; and, in conclusion, the Proprietors trust they need not be accused of unjustifiable pride in expressing their belief, that, in the progress of their undertaking, they shall be the means of publishing, at a price accessible to the public at large, a body of literature deserving the praise of having interesting, many, and amusing; and, above every other species of literature, being fit to be introduced, without reserve or exception, to the father of a family to the domestic circle.

No. 29, Paternoster Row, Jan. 1831.

For Scrap Books, &c.
This day is published, 6s. plain, 12s. coloured,

BOOKS PUBLISHED THIS DAY.

Literary Presents.

FAMILY LIBRARY.

"Books that you may carry to the fire, and hold readily in your hand, are the most useful, after all. A man will often look at them, and be tempted to go on, when he would have been frightened at books of a larger size and of a more crude appearance."—*Dr. Johnson*.

"Mr. Murray's Library.... A very excellent, and always entertaining Miscellany."—*Edinburgh Review*, No. 108.

"La collection qui suit paraître M. Murray, sous le titre de Bibliothèque de Famille, devient de jour en jour plus populaire, et justifie pleinement son succès, par le choix des sujets, les noms des auteurs, et la foule de documents curieux, de faits ignorés, de remarques neuves, que rassemblent les volumes déjà publiés."—*Revue Encyclopédique*.

"Eine vortreffliche sammlung von Volksbüchern."—*Morgenblatt*.

Volumes of the Family Library published up to this time.

Price 5s. each, profusely illustrated, and neatly bound in canvass.

LEVI and SARAH; or, the Jewish Lovers. A Tale of the Polish Jews.

By JULIUS URINSKI NIEMCEWICZ.
"There is much just, and even forcible, description of the manners, habits, peculiarities, &c. of the Polish Jews in this tale. The story is introduced with a brief and highly interesting memoir of the author, who was a bosom friend of the immortal patriot Kosciuszko, and now lives in honourable retirement at Warsaw.—*Scots Times*.

"The English public are much indebted to the translator for making them acquainted with such an author and such a work."—*Scots Times*.

John Murray, Albemarle Street.

THE Right Hon. LADY DURHAM.—A Portrait of the Right Hon. Lady Durham, from the Painting by Sir Thomas Lawrence, embellishes the February Number of La Belle Assemblée, and forms the Seventy-fourth of the Series of the Female Nobility, which is progressively appearing in that highly esteemed publication.

Coloured Engravings of the London Fashions for February, from Original Designs, and also of the latest Parisian Modes, will appear in that style of superiority which has so long characterised La Belle Assemblée.

The Literary Department will consist of an Illustrative and Genealogical Memoir of Lady Durham—the Bride of Death—Satire and Sentiment, a Sketch of Fashionable Life—Scenes in the Upper Regions, No. 1.—Husband Hunters—Moore's Byron—Poetry—a full Explanation of the Fashions, &c. &c.

Princess Esterhazy's extremely beautiful Portrait enriched the January Number; and the following Portraits are in preparation—The King and Queen of England, the Empress of Russia, the Marchioness of Stafford, Countess Dowager, Dowager Countess of Errol, Lady Mary Leslie, Lady Normanby, Countess of Antrim, &c. &c. &c.

Whitaker and Co. London: and may be ordered of all Booksellers in the United Kingdom.

J. MAJOR'S CABINET EDITION of HOGARTH (in Twelve Monthly Numbers, 2s. or Four Quarterly Parts, only 9s. at the option of purchasers). This edition, now ready in both forms, is accompanied by the Commentary of Dr. Tristram, well known as "Hogarth Moralised"—an Introduction, and many additional Notes. It will comprise, in about Seventy Subjects (chiefly on copper, and of larger size than Dr. T.'s original work), every thing by which this inimitable artist is most advantageously known. Each Number will contain Four or Five Copper Plates, with occasional Woodcuts, to be continued Monthly, regularly, with the Magazine, price only 2s. or India Proofs, only 4s. 6d. The Quarterly Parts average the same contents—Thirteen or Fourteen Plates, besides Woodcuts, 9s. each; India Proofs, 18s. 6d. each. In the present day, when the merits of cheapness, compression, and portability, are more than ever acknowledged, the Prospect for fully relies on that prompt encouragement which can alone remunerate so expensive an undertaking, while the earliest orders will, at the same time, strictly obtain the preference with regard to the earliest impressions.

John Major, 56, Fleet Street.

Dr. Lardner's Cabinet Cyclopædia. Price 8s.

A PRELIMINARY DISCOURSE on the STUDY of NATURAL PHILOSOPHY. By J. F. W. HERSCHEL, Esq. A.M. Being Vol. I. of Dr. Lardner's Cabinet Cyclopædia.

In 1 vol. 8vo. pp. 607, with numerous Figures, price 15s. boards.

A SYSTEM of PHRENOLOGY. By GEORGE COMBE. Third edition.

Phrenology treats of the elements of moral and intellectual philosophy, and of the influence of the brain on the mental powers—a point of much importance, but hitherto greatly neglected. Its principles were discovered in 1795, and announced by Dr. Gall in 1795. In the introduction to the present work, the harmony of its principles with acknowledged truths is discussed, with a view to obviate the prejudices of those who, erroneously regarding it as at variance with established science, hesitate to inquire into its merits. The work has been written with constant reference and application to the moral and intellectual interests and duties of man, to the affairs of life, and to the development and workings of individual and national character. It is illustrated by numerous figures of the heads of remarkable individuals, and of the chief different nations. It is intended to serve at once as a system of phrenology, and as a manual of practical philosophy.

The first edition was reprinted in America; the second edition, consisting of a thousand copies, has been sold in face of the general opposition of the learned and the popular press. The Edinburgh Review, and the present edition is offered in compliance with public demand. The regular and progressive sale of the former editions affords evidence that the subject possesses attractions; for nothing but its inherent interest could have supported it against the opposition which it has encountered.

New and improved Editions of the following approved Books of Education by Major, Blair, Goldsmith, Joyce, Barrow, &c. &c. have just appeared.

GOLDSMITH'S GEOGRAPHY, on a Popular Plan, calculated to convey instruction by means of the striking and pleasing Associations produced by the peculiar Manners, Customs, and Characters of all Nations. A new edition, including Extracts from all the principal recent Voyages and Travels, with beautiful Engravings, Maps, &c. price 16s. 6d. Goldsmith's Grammar of General Geography, improved and modernised, illustrated with Views of the chief Capitals of the World, a Variety of Maps, &c. price 6s. 6d. boards.

Mavor's Spelling-Book, 1s. 6d. Blair's Reading Exercises, 2s. bound. Blair's Class-Book, 5s. bound. Miss Aikin's Poetry for Children at an early Age, 3s. half-bound.

Mavor's Selection of Classical English Poetry, forming a Volume of the choicest Productions in the Language. For the Use of Schools. 5s. 6d. bound.

Mavor's British Nepos, 5s. bound. Mavor's Natural History, 7s. 6d. bound. Mavor's Abridgment of Plutarch, 5s. 6d. bd. Mavor's Universal Short-Hand, 6s. bds. Joyce's Arithmetic, with the New Weights and Measures, 8s. bound.

Key to ditto, 3s. bound. Barrow's Fifty-two School Sermons, 7s. bd. Morrison's Elements of Book-Keeping, by Single and Double Entry. 8vo. 3s. half-bound. Crocker's Elements of Land-Surveying, in all its Branches. With Copper-plates and Woodcuts, 3s. bd. Printed for Longman, Rees, Orme, Brown, and Green.

Miss Mangnall's Historical and Miscellaneous Questions, &c. A new and improved edition. In 18mo. price 5s. bound and lettered.

HISTORICAL and MISCELLANEOUS QUESTIONS, for the Use of Young People, with a Selection of British and General Biography, &c. By RICHARD MANGNALL.

The design of this work is to supply teachers and young persons with a compendium of useful and important information. It comprises a comprehensive abstract of classical, scripture, and general history; a more detailed account of the British Isles, with a sketch of the English Constitution; a select biography of eminent persons; a brief view of classical mythology; a short treatise on the elements of astronomy; besides a great variety of curious and useful miscellaneous matters, relating chiefly to subjects of natural history connected with the domestic arts. The present edition has been carefully revised, and may be recommended as a safe, pleasing, and important assistant to parents and to private and public instructors.

By the same Author, A Compendium of Geography, 7s. 6d. bd. Printed for Longman, Rees, Orme, Brown, and Green.

Printed for Longman and Co.; and John Taylor.

A SYSTEM of PHRENOLOGY. By GEORGE COMBE. Third edition.

Phrenology treats of the elements of moral and intellectual philosophy, and of the influence of the brain on the mental powers—a point of much importance, but hitherto greatly neglected. Its principles were discovered in 1795, and announced by Dr. Gall in 1795. In the introduction to the present work, the harmony of its principles with acknowledged truths is discussed, with a view to obviate the prejudices of those who, erroneously regarding it as at variance with established science, hesitate to inquire into its merits.

The work has been written with constant reference and application to the moral and intellectual interests and duties of man, to the affairs of life, and to the development and workings of individual and national character. It is illustrated by numerous figures of the heads of remarkable individuals, and of the chief different nations. It is intended to serve at once as a system of phrenology, and as a manual of practical philosophy.

The first edition was reprinted in America; the second edition, consisting of a thousand copies, has been sold in face of the general opposition of the learned and the popular press. The Edinburgh Review, and the present edition is offered in compliance with public demand. The regular and progressive sale of the former editions affords evidence that the subject possesses attractions; for nothing but its inherent interest could have supported it against the opposition which it has encountered.

New and improved Editions of the following approved Books of Education by Major, Blair, Goldsmith, Joyce, Barrow, &c. &c. have just appeared.

GOLDSMITH'S GEOGRAPHY, on a Popular Plan, calculated to convey instruction by means of the striking and pleasing Associations produced by the peculiar Manners, Customs, and Characters of all Nations. A new edition, including Extracts from all the principal recent Voyages and Travels, with beautiful Engravings, Maps, &c. price 16s. 6d. Goldsmith's Grammar of General Geography, improved and modernised, illustrated with Views of the chief Capitals of the World, a Variety of Maps, &c. price 6s. 6d. boards.

Mavor's Spelling-Book, 1s. 6d. Blair's Reading Exercises, 2s. bound. Blair's Class-Book, 5s. bound. Miss Aikin's Poetry for Children at an early Age, 3s. half-bound.

Mavor's Selection of Classical English Poetry, forming a Volume of the choicest Productions in the Language. For the Use of Schools. 5s. 6d. bound.

Mavor's British Nepos, 5s. bound. Mavor's Natural History, 7s. 6d. bound. Mavor's Abridgment of Plutarch, 5s. 6d. bd. Mavor's Universal Short-Hand, 6s. bds. Joyce's Arithmetic, with the New Weights and Measures, 8s. bound.

Key to ditto, 3s. bound. Barrow's Fifty-two School Sermons, 7s. bd. Morrison's Elements of Book-Keeping, by Single and Double Entry. 8vo. 3s. half-bound. Crocker's Elements of Land-Surveying, in all its Branches. With Copper-plates and Woodcuts, 3s. bd. Printed for Longman, Rees, Orme, Brown, and Green.

Miss Mangnall's Historical and Miscellaneous Questions, &c. A new and improved edition. In 18mo. price 5s. bound and lettered.

HISTORICAL and MISCELLANEOUS QUESTIONS, for the Use of Young People, with a Selection of British and General Biography, &c. By RICHARD MANGNALL.

The design of this work is to supply teachers and young persons with a compendium of useful and important information. It comprises a comprehensive abstract of classical, scripture, and general history; a more detailed account of the British Isles, with a sketch of the English Constitution; a select biography of eminent persons; a brief view of classical mythology; a short treatise on the elements of astronomy; besides a great variety of curious and useful miscellaneous matters, relating chiefly to subjects of natural history connected with the domestic arts. The present edition has been carefully revised, and may be recommended as a safe, pleasing, and important assistant to parents and to private and public instructors.

By the same Author, A Compendium of Geography, 7s. 6d. bd. Printed for Longman, Rees, Orme, Brown, and Green.

Published by Longman, Rees, Orme, Brown, and Green, London: John Arden, Jun. 55, North Bridge Street, Edinburgh; and J. M. Leckie, Dublin.

In 1 vol. 8vo. pp. 607, with numerous Figures, price 15s. boards.

Important Medical Works,
Just published, by G. Underwood, 25, Fleet Street.

THE INFLUENCE OF CLIMATE IN CHRONIC DISEASES OF THE CHEST, DIGESTIVE ORGANS, &c. with an Account of the Place resorted to by Invalids in England, the South of Europe, &c.; their Merits in particular Diseases; and Directions for Invalids while travelling and residing abroad.

By JAMES CLARK, M.D.
Member of the Royal College of Physicians.
"Dr. Clark's work must form an indispensable companion to every invalid who seeks restoration of health, or prolongation of life, beneath a milder sky than that which lowers over his native land. It will form a very useful book of reference for the medical practitioners of this country, few of whom fail to be consulted as to the influence of change of climate on various diseases."—*Med. Chir. Review*, July 1883, p. 141.

Dr. Clark on Diet.—Fourth edition, enlarged.
In 8vo. price 10s. 6d.

A Treatise on Diet, with a View to establish, on Practical Grounds, a System of Rules for the Prevention and Cure of the Diseases incident to a Disordered State of the Digestive Functions. By J. A. Paris, M.D. F.R.S. Fellow of the Royal College of Physicians.

"The information which it contains is important, and in very many instances altogether new. The arrangement is judicious, and as it should be; the style popular and familiar."—*Times Journal*.

The Study of Medicine.—In 5 vols. 8vo. 2s. 15s.

Good's Study of Medicine, 3d edition, containing all the Author's final Corrections and Improvements, together with much additional modern information. Edited by Samuel Cooper, Author of the "Dictionary of Practical Surgery." "The additions to the text and notes by Mr. Cooper, as may be seen by the title, are numerous and valuable, and of great merit, and our most unqualified recommendation. The surgeon whose library contains Good's Study of Medicine, and Cooper's Surgical Dictionary, need look around him for little more that is either scientific, useful, or practical, in any branch of his profession."—*Lancet*, Nov. 1884.

Dr. Paris's Pharmacologia.—7th edition, 3 vols. 8vo. 17s. 10s.

Pharmacologia; comprehending the Art of Prescribing upon the most sound Scientific Principles; together with the History of Medicinal Substances. By J. A. Paris, M.D. F.R.S. &c.

This edition contains the Medicinal Dynamometer, or Revolving Scale, exhibiting the relative strength of Medicines.

Dr. Brande's Pharmacy.—3d edition, 8vo. 14s.

A Manual of Pharmacy, by William Thomas Brande, Lecturer on Pharmacy to the Apothecaries' Company, &c. &c.

Mr. Brande's extensive experience as a pharmacist is very ably embodied in this work, which should be in the possession of every practitioner and pharmacologist."—*London Medical Repository*.

Dr. Thomson's Conspectus.—9th edition, 8s. 6d.

Thomson's Conspectus of the Pharmacopoeia, including the new French and American Remedies, with an Appendix on Poisons, a Selection of Extemporaneous Prescriptions, and an Analysis of Mineral Waters, &c. &c. corrected and greatly improved.

3d edition, price 8s.

A Manual of Midwifery, comprising an Account of the Diseases of Women and Children. By Michael Ryan, M.D. Member of the Royal College of Physicians in London, and Editor of the *London Medical and Surgical Journal*.

"A work replete with information."—*Good's Study of Medicine*, by Cooper.

"Le Manuel de M. Ryan est destiné à devenir classique; aussi qu'on nous doive le recommander aux étudiants de Paris et de Montpellier."—*Rev. Méd. Franc.* 1880.

"We most cordially recommend it to the American public."—*Amer. Journ. of the Medical Sciences*, 1880.

In the press, by the same Author,

A Manual of State and Forensic Medicine.

THE FOREIGN QUARTERLY REVIEW, No. XIII. was published on Friday, the 28th inst.

A new edition, 3 vols. small 8vo. 10s. 6d. half-bound,

BERTHA'S JOURNAL, comprising a variety of interesting information for Young Persons arranged for every Day in the Year.

"We have seldom before noticed a work more replete with amusing and diversified information, conveyed in an agreeable style and adapted to juvenile minds. We are much mistaken if many are not attracted to the acquisition of knowledge by a perusal of these volumes. We can recommend the work most earnestly to those who wish to place an interesting book in the hands of youth."—*Adantic Journal*.

"It is with sincere pleasure that we have perused these volumes, which, with all the clearness and accuracy of Mrs. Mary's justly celebrated conversations, have a familiarity and elementary simplicity about them, that at once qualify them for, we had almost said, the exclusive perusal of most advanced children. We had of a family, we presume, will think of dispensing with the book, at least no one that is anxious to invigorate the minds of her children by communicating to them an early taste for the many valuable and profitable pursuits of the human understanding."—*Monthly Review*.

"Pour les enfants dans l'esprit actif réclame de nouveaux allures, le *Vie de Bertha* leur sera une mine précieuse, ou leur curiosité sera comblée de ce qu'il se satisfait—on annonce comme une excellente traduction de ce livre."—*Le Courrier de la Presse*.

"Of all the little works contrived of late years for the purpose of amplying information to young folks in an attractive manner, we think, will prove by far the most successful."—*Monthly Review*.

"An admirable production of its class."—*Court Journal*.

"As interesting present for young people. The book is extremely cheap, only half-a-guinea for three volumes!"—*Spectator*.

"A great variety of information is here pleasantly collected."—*Literary Gazette*.

LETTERS ON DEMONOLOGY and WITCHCRAFT.

By SIR WALTER SCOTT, Bart.

"The subject is most alluring, and the manner in which it is handled is magical."—*Albion*.

"It hazards little to predict that this volume will prove the most popular of all that Mr. Murray has yet put forth, for the public amusement and instruction, in his Family Library."—*Spectator*.

"One of the most useful, and certainly one of the most entertaining, in the Family Library."—*Courier*.

"The subject is one in which Sir Walter is perfectly at home, and is handled with that tact and ability so peculiarly his own."—*Globe*.

"We must leave this delightful volume to the universal admiration which it will obtain, and to that consequent 'parlour-window' immortality which it will command more surely and deservedly than any other of the writer's works."—*Court Journal*.

John Murray, Albemarle Street.

Of whom may be had, just published, 4s. each,

The Family Library, Dramatic Series, Numbers I. and II. being the Works of Philip Massinger, Vols. I. and II.; illustrated with Explanatory Notes, and adapted to Family Reading and the Use of Young Persons, by the omission of exceptional passages.

Army and Navy. Price 3s. 6d. the First Number of

THE UNITED SERVICE JOURNAL

and NAVAL and MILITARY MAGAZINE. Enlarged for the year 1881; comprising upwards of Forty Original Articles.

"The United Service Journal is confessedly one of the best periodicals of its kind that have ever issued from the public press. No monthly journal has yet appeared so devotedly attached to the interests of the army and navy, or whose claims to the patronage of both services are so strikingly conspicuous. It is full of agreeable anecdotes and useful information. In its pages we find a faithful and most interesting record of past achievements, whether on sea or land, diversified by many characteristic traits of British heroism, and national gallantry, from the lowest to the highest rank in the service. The improvements in gunnery, navigation, and the art of war, are exposed to view with the commanding powers of a master hand, while no subject is omitted which could by possibility involve the honour and welfare of our army and navy. In fine, the Journal affords a correct summary of all changes in the station, regiments and ships of the line, besides an authentic return of the promotions in the red and the blue. Independently of the attractions it has for a military man, this periodical may be read with much pleasure by a civilian, and we feel much gratification in stating that it enjoys a very respectable patronage."—*Liverpool Chronicle*.

Henry Colburn and Richard Bentley, New Burlington Street.

THE NEW MONTHLY MAGAZINE

for February is embellished with a beautifully engraved Portrait of the Hon. Mrs. Norton, Authoress of the *Borrows of Rosalie*, the *Undying One*, and other Poems. |-----------------------|--------------------------|
| 1. William of Wyckham | 5. Gibbs |
| 2. Inigo Jones | 6. Kent |
| 3. Christopher Wren | 7. Earl of Burlington |
| 4. Sir John Vanbrugh | 8. Sir William Chambers. |
- John Murray, Albemarle Street.

Interesting Works just published by Henry Colburn and Richard Bentley, New Burlington Street.

THE MARQUESS OF LONDONDERRY'S
NARRATIVE OF THE LATE WAR IN GERMANY and
FRANCE.

"No history of the events to which it relates can be correct without reference to its statements."—*Literary Gazette*.
"The only connected and well-authenticated account we have of the spirit-stirring scenes which preceded the fall of Napoleon. The work deserves a place in every historical library."—*Globe*.

II.

Memoirs and Correspondence of Thomas Jefferson, late President of the United States. Edited by Thomas Jefferson Randolph. Complete in 4 vols. 8vo. with Portrait and Fac-simile of the original Declaration of Independence in the hand-writing of Jefferson.

"These volumes must be read with intense interest. They will form the code of future legislators. They are worthy of transmitting a great name to immortality."—*Adelphi*.
"The work must undoubtedly form a part of every historical library."—*Spectator*.

III.

The Life of Dr. Edmund Calamy, written by Himself. Now first printed from the original MS. 2d edition, in 2 large vols. 8vo. with fine Portrait.

"The life of this great divine includes a period of sixty years, distinguished by some of the most remarkable events that figure in our annals. It forms a valuable addition to the history of our own country, and commensurate in importance with the Diaries of Pepys, Evelyn, and Clarendon."—*Evening Paper*.

"We know of no work of rarer value than the present."—*Literary Gazette*.

IV.

Colman's Random Records, with Portrait, dedicated, by gracious permission, to His Majesty. In 2 vols. small 8vo.

"This production abounds in amusing and interesting subjects."—*Morning Post*.
"The most amusing, if not the best specimen of dramatic memoirs hitherto offered to the public."—*Court Journal*.

V.

The Diary of Ralph Thoresby, Author of the "History of Leeds." Edited by the Rev. Joseph Hunter, F.R.S.A. In 2 vols. 8vo.

"A curious, a very curious publication."—*Literary Gazette*.
"It contains a variety of original and curious notices of nearly all the literary and scientific characters who flourished at the close of the seventeenth and at the beginning of the eighteenth centuries."—*Courier*.

Also, in the press,

The Correspondence of this eminent Writer with some of the most distinguished Characters of the Age.

8vo. 6s. 6d.

A GERMAN GRAMMAR, on a New Principle, calculated to facilitate the Acquisition of the Language by the English Student.

By C. C. BECKER, M.D.

"Becker's Grammar is the work of a philologist and philosopher, and we greatly prefer it to any of the theoretical grammars we have ever seen. Were we now to begin to learn German, we should seek aid, in preference, from Becker, before any other that we are acquainted with, though we have on our shelves a German grammar that has passed through upwards of twenty editions."—*Spectator*.

John Murray, Albemarle Street.

BOOKS IN THE PRESS.

JOURNAL of the ROYAL INSTITUTION.

Among the Original Papers in the Second Number, which will be published on the 1st of February, 1831, are the following:—On the Decomposition of the Vegetable Alkaline Salts, by W. T. Brande, Esq. F.R.S. &c. &c.—On a peculiar Class of Optical Deceptions by Michael Faraday, Esq. F.R.S. &c. &c.—On the Mode of ascertaining the Commercial Value of Manganese, by Edward Turner, M.D. F.R.S. &c. &c. Professor of Chemistry in the London University—On the Magnetic Curv., by Mark Rogee, M.D. Secretary of the Royal Society, &c. &c.—On the Construction of Arches, by M. Lassalle, Architect to the King of Prussia, communicated by Professor Whewell—On Vomiting, by Marshall Hall, M.D. &c. &c.—On Stuttering, by the Same—On the Aurora Borealis of the 7th January, 1831, by S. H. Christie, Esq. F.R.S. &c. &c.—On the Performance of the Magnetism in Steel Bars, by the Same—On the Invention of the Telescope, by Professor Moir of Utrecht—On the Rainbow, by Alfred Ainger, Esq.—On the late Eruption of Mount Vesuvius, by Dr. Donati—On a New Comet, by Professor Dabadie—On Induced Phosphorescence, by Mr. Thomas Pearssall—Description of a new Hydraulic Siphon, by Mr. Almond—With the usual Miscellaneous Scientific Intelligence, &c. &c.

John Murray, Albemarle Street.

Hugh's Divines of the Church.

On the 1st of February, 7s. 6d.

THE WORKS OF DR. ISAAC BARROW,

Vol. IV. being No. IX. of the Divines of the Church of England, continued Monthly, with a Summary to each Discourse. Note, &c. In this volume are given the hitherto unpublished Sermons of Dr. Barrow.

No. XI. will commence a Selection from the Writings of Jeremy Taylor, with a Memoir by the Editor.

The First Five Numbers contain the only complete edition of Sherlock's Works. Printed and published by A. J. Valpy, M.A., Red Lion Court, Fleet Street; and sold by all Booksellers. Any Author may be had separately, at a small advance of price.

English Translations of the Classics.

On the 1st of February, 4s. 6d.

MURPHY'S TRANSLATION OF TACITUS, Vol. IV.: being No. XIV. of Valpy's Classical Library.

No. XVI. and XVII. will comprise Horace; in which will be introduced Translations of different parts of that Author for the purpose of forming a new edition of Johnson, Byron, &c. and some of the most eminent Poets of the present day; with a Portrait of Horace and a Biographical Sketch.

Theophrastus, with Fifty fine characteristic Portraits, and Phædrus's Fables, will be given together in an early Number.

Juvenal and Persius will soon appear together.

The Thirteen First Numbers of the Series contain—Dædemon, Sallust, Xenophon, Herodotus, Virgil, Pindar, Anacreon, and Tacitus. Any Author may be purchased separately, as part of the Series, at 4s. 6d. per Number, or perfect in themselves at a small advance in price.

If you desire your son, though no great scholar, to read and reflect, it is your duty to place into his hands the best translations of the best classical authors."—*Dr. Parr*. Printed and published by A. J. Valpy, M.A., Red Lion Court, Fleet Street; and sold by all Booksellers in Town and Country.

The following New Books will be published in a few days:—

A FIFTH and SIXTH VOLUME OF LORD BYRON'S WORKS, containing Poems not included in any previous Editions, many of them published for the first time—English Bards, Hints from Horace, Heaven and Earth, Werner, Deformed Transformed, the Island, &c. &c. rendering this the first and only complete edition ever printed. (Don Juan alone being excluded.) 2 vols.

••• To match with the edition of Lord Byron's Works, in 4 vols. 18mo.

2. **Boswell's Life of Johnson**, a new edition, incorporating the Tour in Wales, Tour to the Hebrides, Haverling, Pizios, &c. Edited and illustrated with numerous Biographical and Historical Notes. By the Right Hon. John Wilson Croker. With Portraits. 5 vols.

3. **A Year in Spain.** By a Young American. 2 vols. post 8vo.

4. **A Selection from the Papers of the Earls of Marchmont**, in the possession of the Right Honourable Sir G. H. Rose, illustrative of Events from 1685 to 1750. 3 vols. 8vo.

5. **Essay on the Origin and Prospects of Man.** By Thomas Hope, Esq. 8 vols. 8vo.

6. **Attempts in Verse**, by John Jones, an old Servant. With some Account of the Writer, and an introductory Essay on the Lives and Works of uneducated Poets. By Robert Southey, LL.D. Crown 8vo. printed uniformly with *Kirk White's Remains*. 10s. 6d.

7. **Proverbs of the Modern Egyptians**, illustrating their Manners and Customs. By the late John Lewis Barchard. 4to.

8. **Müller's Dorians.** Translated from the German. By Henry Tufnel, Esq. and George Cornwall Lewis, Esq. With very superior Maps. 8 vols. 8vo.

9. **On Financial Reform.** By Sir Henry Farnell, Bart. A cheap edition, being the Third. Small 8vo.

10. **The Iliad of Homer.** Translated by William Sotheby, Esq. 2 vols. 8vo.

John Murray, Albemarle Street.

In a few days, in 2 vols.

THE INCOGNITO; or, Sins and Peccadilloes.

By the Author of the "Cavillien," &c. Printed for Whittaker, Treacher, and Co. Ave Maria Lane.

New Publications.

Part X. plain and coloured, will be published on the 1st instant.

THE FAMILY CABINET ATLAS.—To

be completed in Two more Parts, comprising altogether One Hundred Maps, &c. from Steel Engravings, planned and executed in the finest style of art, for distinctness, facility of reference, and extraordinary comprehensiveness; presenting, in a volume of the same size as the "Family Library," nearly fifty thousand names of places, &c.

"This Atlas far surpasses any thing of the kind."—*Weekly Review*.

Just published,

2. **The Romance of History.—France.** By Leitch Ritchie. From the time of Charlemagne to Louis XIV. inclusive. 2 vols.

"Mr. Ritchie is the Scott of the short, picturesque, bald, dramatic story."—*Atlas*.

3. **The Romance of History.—England.** By Henry Neale. 4th edition, bound, with Plates, price 18s.

4. **Chatterley, the Fatalist.** By a Contributor to "Blackwood." 3 vols.

"This is a valuable novel."—*Spectator*.

5. **Lives of the Italian Poets**, by the Rev. Henry Stebbing, A.M. Author of the History of Chivalry, &c. Embellished with 20 Medallion Portraits. 3 vols.

6. **The Way of the World.** By the Author of "De Lile." In 3 vols.

"We prefer this to the author's former works."—*Lit. Gaz.*
"The author possesses profound powers of thought."—*Times*.

7. **The Chancery Suit; a Comedy**, by R. B. Peake, Esq. With a humorous Dedication to the Lord High Chancellor of England.

8. **The Anatomy of Society.** By J. A. St. John. In 3 vols. (nearly ready).

Printed for Edward Ball, New Public Subscription Library, 30, Holles Street, Cavendish Square.

On the 1st of February will be published, price 5s. Vol. X. of

THE ALDINE EDITION OF THE BRITISH

POETS; containing the Poems of Henry Howard, Earl of Surrey; with a Portrait and original Memoir.

Vols. I. and II. contain the Poems of Burns.

Vols. III. and IV. the Poems of Thomson.

Vol. V. the Poems of Collins.

Vol. VI. the Poems of Kirk White.

Vols. VII. and VIII. the Poems of Cowper.

"Of the technical part of the Aldine Edition of the Poets we have only to repeat the praise we have already most cordially given—the perfection of printing, beautiful paper, a neat engraving, whose subject alone would give it interest, works the most valuable in our literature, and every possible information carefully collected respecting the writers—add to all this, a price infinitely lower than what is affixed to the thousand volumes of poetry which every day appear, and are every day forgotten—are we not justified in saying the publisher deserves all the patronage public favour can bestow, and in recommending the immediate purchase of these volumes? Not only to every library, but to every little bookcase, where a few pretty and favourite volumes are a treasure of great enjoyment amid more active and worldly avocations?"—*Literary Gazette*, No. 713.

William Pickering, Chancery Lane, London.

On the 1st of February will be published, price 2s. 6d. No. I.

THE LIBRARY of the FINE ARTS;

or, Monthly Repertory of Painting, Sculpture, Architecture, and Engraving.

Contents: Preliminary Address—Biography: G. Dawe, Esq., R.A.—Sculpture: a Prize Poem, by E. G. L. Bulwer, Esq.—The Virgins, the National Art-Union, H. A. Canningham's British Painters—Felicien's Tent of Darius—Unpublished Original Notes of Sir J. Reynolds—The Annuals—History and Process of Lithography—Letter on Artists and Dealers—Reprint of Reynolds' Discourses—Miscellaneous.

M. Arnold, Tavistock Street, Covent Garden.

In a few days, in post 8vo.

TOPOGRAPHICAL DICTIONARY of

LONDON and its ENVIRONS.

Containing descriptive Accounts of all Buildings, Offices, Docts, Squares, Streets, Wards, Liberties, Institutions, Establishments, with Lists of the Officers, Pastors, Incumbents of Livings, &c. &c. in the British Metropolis.

By JAMES ELMES, Surveyor of the Port of London. Printed for Whittaker, Treacher, and Co. Ave Maria Lane.

Fashions for February.

THE MAGAZINE of the BEAU MONDE;

Monthly Journal of Fashion, for February, will be splendidly embellished with Four royal 4to. Plates, containing the most elegant assemblage of London and Parisian Costumes, Colfures, Millinery, &c. &c. far surpassing, both in number and beauty, any Publication of the day. Price 2s.

Published by R. Glynn, 86, Pall Mall, London.

On Monday,

FRASER'S MAGAZINE for TOWN and COUNTRY, price 2s. 6d.

The February Number commences a new Volume, and contains the Repeal of the Union—Peter Nimmo—Osculation of the Stars—a Day in Kent—Fatal Presentments—Geordie Scott, a Hamely Farmer. By the Etirick Shoberden, the only daughter, a Scotch Lady—Southey's Life of Bunyan—a Literary Sketch of Crofton Croker, Esq. with a Full-length Portrait—Unrepresented London, with a Plan of the Metropolis—the Beetle—France in 1829-30. By Lady Morgan—On the Vote by Ballot—the Novels of the Seasons—the Colonists versus the Anti-Slavery Society.

James Fraser, 218, Regent Street, London; John Boyd, Edinburgh; and Grant and Co. Dublin.

LONDON: Published every Saturday, by W. A. SCRIPPS, at the LITERARY GAZETTE OFFICE, 7, Wellington Street, Waterloo Bridge, Strand, and 15, South Molton Street, Oxford Street; sold also by J. Chappell, 35, Royal Exchange; R. Marlborough, Ave Maria Lane, Ludgate Hill; A. Black, 25, Abchurch Lane; J. B. Roberts, 2, Broad Street; A. Adkins, and Co. Glasgow; and J. Cunningham, Dublin.—Agent for America, O. RICH, 15, Red Lion Square, London.

J. MOYES, Took's Court, Chancery Lane.

THE LONDON LITERARY GAZETTE;

Journal of Belles Lettres, Arts, Sciences, &c.

AND

This Journal is supplied Weekly, or Monthly, by the principal Booksellers and Newsmen, throughout the Kingdom; but to those who may desire its immediate transmission, by post, we recommend the LITERARY GAZETTE printed on stamped paper, price One Shilling.

No. 733.

SATURDAY, FEBRUARY 5, 1831.

PRICE 8d.

REVIEW OF NEW BOOKS.

Attempts in Verse, by John Jones, an old Servant: with some Account of the Writer, written by himself; and an Introductory Essay on the Lives and Works of our uneducated Poets. By Robert Southey, Esq., Poet Laureate. 8vo. pp. 332. London, J. Murray.

THIS title-page certainly conveys an erroneous idea of the benevolent design of the Poet Laureate. His part of the volume can hardly be called an essay, &c. on our illiterate poets, though it is a pleasing biography of some of them, with a very few remarks upon their performances. Of John Jones, its chief character, we learn that he has been in service from his boyhood, and is now butler to a respectable family near Harrogate, where, about three years ago, he had the good fortune to attract the attention of Mr. Southey, in consequence of addressing a letter to that gentleman, requesting his opinion of his poetical productions. Struck with the humility and good sense with which this application was made, yet declaring against it as a precedent, Mr. Southey not only took the worthy butler by the hand, and got him a long list of subscribers, but, by furnishing these memoirs of a number of uneducated bards of the same class, has linked his name to a volume of considerable interest in the annals of our poetical literature.

In Jones's letter to the laureate, he enclosed a copy of verses to "the red-breast," of which the latter thinks more highly than we do; though we rejoice in the results to which they led, amid the monotony of Harrogate, and the sensuous tastes of its Helicon. No observer of nature could ever speak of this fierce and predatory feathered hero in these words:

"Thy friendly heart, thy nature mild,
Thy meekness and docility,
Came to the love of man and child,
And win their own felicity!"

For the nature of our dear little dashing robin is just the reverse. Southey, however, was in the humour to be pleased; and every thing, like the bird's breast, was rose-coloured; which remark brings us to his introduction. Here, he playfully tells us:

"Sir Joseph Banks used pleasantly to complain that tortoise-shell tom-cats were the plague of his life, because every ignorant man or woman who happened to possess one, favoured him with the first offer of it, at fifty, or perhaps an hundred guineas below what, upon the faith of vulgar opinion, they believed to be the established price of so great a curiosity. For this flattering preference Sir Joseph was indebted to the high rank in the scientific world which he so deservedly held and filled so worthily: it was a tribute to his station and his character. Authors, and especially poets, who send their works for my perusal and opinion and advice thereon, have been as much the plague of my life as the tom-tortoise-shells were of his. Mr. George Colman has no more in his office of licenser for the stage; and the office which has thus been thrust

upon me is a sine-salary, and the business itself is of a more ungracious kind."

We have been somewhat amused at the little escape of vanity in this passage; the implied comparison with one who deservedly held such high rank in the scientific world is not amiss. But, in truth, a Southey is worth ten Banks's; and it is only the self-complacency of the paragraph which is worthy of a simile: had it come from any other quarter, it would not have been even a compliment. With regard to the contrast with the facetious licenser for the stage, we are really of opinion that both he and the laureate are amply paid for what they do. We would engage, in these times of retrenchment and economy, to procure one person to fulfil the duties of the two, and equally well, at half-price. But let that pass. In answer to Jones, the author states:

"That instead of returning a discouraging reply, and thus preventing any farther trouble to myself, I told my humble applicant he might send me his book, warning him, however, against indulging in any expectation that such poems would be found generally acceptable in these days; the time for them was gone by, and whether the public had grown wiser in these matters or not, it had certainly become less tolerant and less charitable."

Is this not an Irish reason for afterwards publishing these very poems, and a whole volume besides of similar matter? Still the kind intention remains the same, and is entitled to the same approbation; we simply object to looking one way and rowing another, of which we have several instances in these pages. For example, the author thus describes his motives—

"If I could render some little service to a man of more than ordinary worth (for such, upon the best testimony, Mr. Jones appeared to be), it would be something not to be repented of, even though I should fail in the hope (which failure, however, I did not apprehend) of affording some gratification to 'gentle readers;' for readers there still are, who, having escaped the epidemic disease of criticism, are willing to be pleased, and grateful to those from whose writings they derive amusement or instruction."

Why Mr. Southey, himself a professional critic, and often a severe and caustic one, should affect to run down the craft, and "do the amiable" to gentle readers on this particular occasion, we cannot explain. It seems to us to be an affectation of superiority, which even his great abilities, his vast fund of acquired knowledge, his admirable facility and grace of style, and his many extraordinary qualifications, do not justify. There are—take the world as it goes—few Southey's; but, if there were fewer, not one of the best of them (if there can be a best among equalities) has a right to say, when inclined to be critical, "I am Sir Oracle, when I speak, let no dog bark;" and when he chooses to play the piano of a literary cicero, to run down the congeners of his other character. Even where we agree with him in sentiment

(if it be possible to make it distinctly out), we must defend ourselves from a communion in this respect:

"Bad poetry—(if it be harmless in its intent and tendency)—can do no harm, unless it passes for good, becomes fashionable, and so tends to deprave still further a vitiated public taste, and still further to debase a corrupted language. Bad criticism is a much worse thing, because a much more injurious one, both to the self-satisfied writer and the assentient reader; not to mention, that without the assistance of bad criticism, bad poetry would but seldom make its way.* The mediocres have long been a numerous and an increasing race, and they must necessarily multiply with the progress of civilisation. But it would be difficult to say wherefore it should be treated as an offence against the public, to publish verses which no one is obliged either to purchase or to read. Booksellers are not likely to speculate at their own cost in such wares; there is a direct gain to other branches of trade; employment is given where it is wanted; and if pecuniary loss be a matter of indifference to the author, there is then no injury to himself, and he could not have indulged himself in a more innocent folly, if folly it should deserve to be called. But if he is a good and amiable man, he will be both the better and the happier for writing verses. 'Poetry,' says Landor, 'opens many sources of tenderness, that lie for ever in the rock without it.'"

To all this we most heartily subscribe; but, continues Mr. S.:

"If, indeed, a poet feels in himself a constant craving for reputation, and a desire of depreciating those who have been more successful than himself,—if he looks upon them as his competitors and rivals, not as his brethren in the art,—then verily it is unfortunate for such a man that he possesses the talent of versifying. And in that case he will soon betake himself to criticism, as a more congenial calling; for bad poets become malevolent critics, just as weak wine turns to vinegar."

Excepting that this is not pure grammar, we would have given our ears to have written it. We fancy Mr. Southey in Westmoreland, at Harrogate, and in divers delightful retirements, unacquainted with the little reviewing, criticising, envying, backbiting circles of London (the great theatre, notwithstanding); and we wonder at the accuracy of his notions. How many coxcombs and asses do we know, whose only talent is depreciation; how many critics, as cutting as new cutlery, who are but Birmingham blunts sharpened by the failure of their own attempts. Pitt said, "I could make ten patriots, in a day, by refusing presumptuous requests, and crushing unreasonable expectations." It is the same with literature as with politics (to imitate Southey in a comparison—see Sir J. Banks *passim*)—we can make a very respectable number (i. e.

* We mark this as a doubtful assertion, though Heaven forbid we should be reckoned the champions of bad criticism.—Ed. L. G.

respectable in number) of critics in any week of our existence. But the "vinegar" is as indifferent as the "wine;" and as nobody cares to drink the latter, so nobody heeds the sub-acid of the former. Let us turn to some better stuff than either,—the fine argument of the author for his adopting this individual instance of servile poetry.

"There were many, I thought, who would be pleased at seeing how much intellectual enjoyment had been attained in humble life, and in very unfavourable circumstances; and that this exercise of the mind, instead of rendering the individual discontented with his station, had conducted greatly to his happiness, and if it had not made him a good man, had contributed to keep him so. This pleasure should in itself, methought, be sufficient to content those subscribers who might kindly patronise a little volume of his verses. Moreover, I considered that as the Age of Reason had commenced, and we were advancing with quick step in the March of Intellect, Mr. Jones would in all likelihood be the last versifier of his class; something might properly be said of his predecessors, the poets in low life, who with more or less good fortune had obtained notice in their day; and here would be matter for an introductory essay, not uninteresting in itself, and contributing something towards our literary history."

The "last versifier of his class" is, as the *Quarterly Review* says, nonsense: there will be thousands yet. Imperfect civilisation, and the imperfect instruction of "the school-master," are but weak barriers against human nature; and, so long as there is any portion of the community unspoiled by bad culture, we shall have poets as genuine as John Jones. But the rest of the passage is just; a love of poetry not only never injured a living being,—it must improve and elevate. Like the sense of honour, which may plunge its inheritors sometimes into situations which cannot be prudently defended; if it lead to a few unessential follies, it preserves the highest and the best of feelings: and what noble soul would not rather be pitted (that is the word) for a negligence injurious to none but its owner, than be doomed to endure the sycophancy and adulation paid to the most fortunate of the heartless worldlings around?

After a brief introduction, the author gives us an agreeable life of Taylor the Water Poet, with specimens of his curious poems; then of Stephen Duck, James Woodhouse, John Bennett, Ann Yearsley, J. F. Bryant,—all untaught; and, if we may say so without heresy, unreadable versifiers. Imitation is the bane of the mass; and, after all, imitation is the essence of John Jones. What, under other circumstances, the good feelings and natural talents of these persons might have made them, is an inquiry we cannot solve; but as they really existed, there is nothing beyond the friendly plaudits of their day required, and even Mr. Southey may indite fifty volumes before he can repopularise them. Taylor was the most remarkable of them all; and the partial revival of the best of his poetry offers a pleasant relaxation.

Before offering two or three selections from John Jones, we should notice that Mr. Southey affords us the following agreeable promise:—

"I do not introduce Robert Bloomfield here, because his poems are worthy of preservation separately, and in general collections; and because it is my intention one day to manifest at more length my respect for one whose talents were of no common standard, and whose character

was in all respects exemplary. It is little to the credit of the age, that the latter days of a man whose name was at one time so deservedly popular, should have been past in poverty, and perhaps shortened by distress, that distress having been brought on by no misconduct or imprudence of his own." [Most true.]

The subjoined are the most convenient specimens we can give of Jones's compositions, which fill about 150 pages of the volume.

The Journey of Life.

"The journey of life
There are none can pressage;
From all we can learn
'Tis an uncertain stage:
If short or extended,
No mortal can say,
What up-hills or down-hills
There are in the way;
Yet were all we travellers
Social inclined,
And true honest hearted,
And loving and kind:
Nor man to man scornful,
Nor man to man wrong,
How happily we might
All travel along!
But pow'r will oppress thee,
And pride pass thee by,
And folly will laugh
At a tear in thine eye;
And, should dark misfortune
Thy prospects o'ercast,
E'en friendship will leave thee
Exposed to the blast;
And envy and malice
Augment thy distress;
And cunning and avarice
Thy little make less;
But strengthened by virtue,
Still bravely contend,
And hope will uphold thee,
And God be thy friend."

The Butterfly to his Love.

"Extend thy wings, my dear,
And we will round the bowers go;
The sun is warm and clear,
And inviting is the day;
The dews have left the blade,
And fragrant now the flowers blow,
And, as they blow to fade,
Let's enjoy them while we may!
We're not of mortal mould
To die, and then unfold
Our eyes in still a brighter world,
Its glories to explore:
Our life is but a summer long;
Then let us rove its sweets among,
For when the blast blows bleak and strong,
We sleep to wake no more."

"Old Mawley to his Ass" appears to us to be so eminently ridiculous as to impeach the selector's judgment,—take one verse as a ludicrous example:

"I'll will that, at my latest sigh,
Thou, too, some easy death shalt die,
And in one grave we both will lie,
My own old Ass"!!!

The allowed and sanctioned attack upon one (with all his faults and vices) of our greatest poets, is also a mistake of the editor. When Southey and Byron fought, we could enjoy the lists; but when the lion is dead, his former antagonist ought not to have permitted any inferior kick of the ass.

On the Death of Lord Byron.

"Thy destiny's cast and before thee,
And severed thy body and breath,
Thou'rt left, and the Muses deplore thee,
On the dark and cold desert of death.
The strains of thy lyre were enchanting,
And bore over nature control,
But yet was another chord wanting,
To attune it more sweet to the soul.
The sound that's to merit inspiring,
Its sweet introduction to love,
And cheering to worth in aspiring
To a seat with the blissful above,
Though reckless of these was thy story,
And left to more impotent lays,
The Corsair shall glow in thy glory,
The wanton shall bask in thy praise.
The isle of thy birth is the rarest,
Thy home was the proudest to have,
The fair of her soil are the fairest,
The bravest, her sons, of the brave."

The land of thy sires was forsaken,
Its worthies thy genius abused,
No pride in her virgin was taken,
Its sons were a tribute refused.

In crimes now inglorious a sinner,
With passions unbridled and strong,
Love's current was turned on the stranger,
And the dissolute nursed in the song.

Had thy fame and thy country rather
In an orbit conjunctively shone,
'Twould have beam'd on illuming each other,
Till time had extinguish'd the sun."

We are sensible that, in writing this hasty review of a book received on Thursday, we have only thrown out the crude suggestions of the moment upon passages which struck us; and therefore we beg to end by expressing our applause of the motives which led to its publication, and our candid opinion that it will afford gratification to every literary person.

The Cabinet Cyclopædia, Vol. XV. History of France, Vol. II. By Eyre Evans Crowe. 12mo. pp. 341. London, 1831. Longman and Co.; Taylor.

ON the first volume of this work appearing, we expressed our warm approbation of the judicious manner in which Mr. Crowe had begun his task: arrived, as he now is, at the most interesting period of French history, in repeating our good opinion, it were scant justice not to give that opinion weight by specimens of these pages which lead to its expression. Hitherto, beyond mere abridgments for children, and none of these, till Sir Walter Scott's delightful volumes appeared, going beyond mere dry outline, strange as it may seem to say, a history of France, brought down to the present time, has been wanting in literature. Mr. Crowe's mass of material has been immense, and we think he has shewn great industry in collecting, and great judgment in selecting. These two volumes contain a clear, bold outline of French history, interspersed with philosophical views, and many most judicious remarks. We feel convinced, as we read, of the talents of the writer; and even where we differ from his opinions, we respect them, because given in thoughtfulness and truth. In passing judgment on these pages, it ought to be remembered, that three volumes can be but a compendium. He who reads this work will have an accurate view of the course of events; he will have, as it were, a map of history before him, an excellent foundation, if he chooses to search further, and a sufficient knowledge of details and changes, if content with a general acquaintance. To the young it will be invaluable; and the reader who requires reflection as well as information, may well study these annals for the deep reflection which Mr. Crowe has evidently embodied in them. We now proceed to our extracts, endeavouring as much as possible to mingle remark and anecdote together.

"The noblesse of England, crushed by the imperious spirit of the Conqueror, were subjects, and sympathised with the mass: in France, the same class were either princes, or the followers of princes. Thus, whilst the former raised the standing bulwark of law around their privileges, including, for greater security, those of the people, the French aristocracy, aiming at nothing short of independence at one time, at all times more eager to share than to limit the royal authority, held a contempt for aught like constitutional maxim or law, and, full of recklessness and presumption, sought no other guarantees for their existence than intrigue or the sword. The blending of classes was another fortunate circumstance for England. Nobility, considered in France to extend to the whole

blood, was here confined, with the most beneficial injustice, to the eldest son. The younger branches fell into the ranks of the lower aristocracy, or lesser landholders, who again found themselves associated with the chiefs of the bourgeois class in the lower house of parliament. Thus was solved, and apparently by chance, one of the greatest difficulties of social organization; a difficulty which convulsed the republics of Greece and Rome, and proved the great stumbling-block to upset the latter. France, less fortunate, adopted the classic division of patrician and plebeian; a line equally dangerous to draw as to efface."

The importance of trifles early began at the French court. "The absence of the Count of Soissons from Paris had been owing to a fit of discontent, occasioned by observing the *fleur-de-lis* embroidered on the gown of the duchess of Vendôme at the ceremony of the queen's coronation. The duke being but an illegitimate son of the king, the purer blood of Soissons was indignant." Even when the states-general met—"The most important consideration in the eyes of all was evidently the respective dignity of persons and classes. The first two months were consumed in disputes of precedence, in ceremonials, in mutual compliments between the orders at first, and afterwards in mutual abuse. Miron, provost of the merchants of the city of Paris, was elected president. The address of the commons to the king was spoken by this magistrate on his knees; the deputies were clothed in simple black, whilst priests and nobles shone in gold, and an attempt of the president to wear his dry robes of red and blue in a procession was looked upon as a monstrous piece of ambition."

What a moral depravity is in the following little passage!—"Epernon received a written pardon for his rebellion, but otherwise derived no advantage from it; a circumstance that caused him to be taxed with folly by his contemporaries. Disinterestedness was inconceivable to the age."

The ensuing is one of those correct views in which this author excels.

"The state maxim of that day, the usual policy of weak minds, was to trim a middle course, to hold a balance betwixt contending parties, and allow none, if possible, to be predominant. Such had been the rule of conduct of Mary of Medici, by which she perpetuated all the evils of the state, dissension, rebellion, and aristocratic independence. In this continued game of intrigue, this play of petty motives and petty forces, every head and every thought was absorbed. There was neither leisure nor elevation to afford views of foreign policy or public good. Selfish interests could be the only aim; and these were so numerous, universal, and so complicated, that it required the capacious mind of genius to grasp, in conjunction with them, a patriotic or a public feeling. Such, however, was the mind of Richelieu: he at once towered over the heads of these dwarf statesmen of the court, and saw at a glance the evils that preyed upon France, and neutralized her power. To remove these, and elevate her to her rank amongst nations, was his instant conception. Henry IV. had desired this: he had raised the country to its pre-eminence, and made it respected. But he did not merely by his personal character and humanity; he had not done it permanently: he left all the materials of dissension and insurrection in force. These were principally two, the independent noblesse, and the Huguenots. To overthrow and crush these, to tread them beneath the feet of the monarch, became Richelieu's first object; and towards this he marched through every difficulty, and shrunk from neither peril nor blood. He threw aside the trimming, the balancing policy that had hitherto prevailed, and adopted in its stead that bold, decided, straightforward line of conduct, which suits a mind conscious of superiority and confident of force."

The character of Richelieu is well summed up. "Richelieu was the true monarch of the reign: it was he who stamped upon it the impress of his genius and despotic character. True, he did but adopt and follow up the plans of the great Henry, in humbling the Huguenots, the noblesse, and the house of Austria; but the execution of three such enterprises in the short space of twenty years, and by a minister risen from obscurity, and obliged to act as often in despite of the monarch as with his countenance and aid, places Richelieu in the first rank of statesmen. His address, his firmness, his sagacity, were unequalled. He was naturally magnanimous, loving wealth and splendour more as the symbol of power than as the gratification of selfish vanity. The cruelty of his character is its great blemish; yet he was clement to the Huguenots, and shrunk early from the severe acts which he foresaw his plans for raising royalty would throw upon him. In the states-general for 1614, he proposed to do away with the punishment of death for political crimes, yet he soon came to be unsparing in its infliction; and the decapitation of each new victim increased in him the taste for blood, until his prelate's robe assumed the crimson dye of the murderer and the tyrant. On a superficial view, this minister's unvarying success is the most striking feature of his career; and yet all of this that his own sagacity might not produce, the extreme imprudence and feebleness of his enemies may account for. The crime of having trodden out the last spark of his country's liberties, and of having converted its monarchic government into pure despotism, is that for which Richelieu is most generally condemned. But the state of anarchy which he removed was license, not liberty. The task of reconciling private independence with public peace, civil rights with the existence of justice,—and this without precedent or tradition, without that rooted stock on which freedom, in order to grow and bear fruit, must be grafted,—was a conception which, however familiar to our age, was utterly unknown and impracticable to that of Richelieu. With the horrors of civil war fresh in the memory of all, the general desire was for tranquillity and peace, not liberty; to which, moreover, had it been contemplated, the first necessary step was that of humbling the aristocracy. It was impossible that constitutional freedom could ever grow out of the chaos of privileges, and anarchy, and organised rebellion, that the government had to contend with. In building up her social fabric, France had in fact gone wrong, destroyed the old foundations, and rebuilt on others without solidity or system. To introduce order or add solidity to so ill-constructed a fabric was impossible; Richelieu found it necessary to raze all at once to the ground, except the central donjon of despotism, which he left standing. Had Richelieu, with all his genius and sagacity, undertaken for liberty what he achieved for royalty, his age would have rejected or misunderstood him, as it did Bacon and Galileo. He might, indeed, as a man of letters, have consigned such a political dream to the volume of an Utopia, but from action or administration he would have been soon discarded as a dreamer. Liberty

must come of the claim of the mass; of the general enlightenment, firmness, and probity. It is no great physical secret, which a single brain, finding, may announce and so establish: it is a moral truth, which, like a gem, hides its ray and its preciousness in obscurity, nor becomes refulgent, till all around it is beaming with light. Had we space to enter into the minor details of Richelieu's administration, much might be found to abstract from his merit, much to add to it. His management of the finances was grasping and unwise. France paid dearly for her glory and ascendancy. The 20,000,000 of revenue, that enabled Henry IV. to amass, were quadrupled and yet expended by Richelieu; the greater part being wasted ere it reached the treasury. Thus the proud monarchy which Richelieu founded owed to him also the canker that was destined to destroy it,—the extravagance and mismanagement of its pecuniary resources. For the sake of a certain revenue, there were 40,000 employments in finance and law left in the hereditary possession of subjects; an anomaly in a despotism scarcely credible. But the minister could not venture to attack at once the noblesse of the sword and that of the robe. He destroyed the former, and contented himself with humbling the latter."

We here subjoin the sketch of "the celebrated Father Joseph, a capuchin friar, the follower and confidant of Richelieu. We can scarcely imagine a statesman and an ambassador clothed in a monk's frock and sandals; yet such was Father Joseph, a name more or less mingled in all the intrigues of the French court, and its negotiations with others. His influence was known, and he was dreaded by the court as a kind of evil spirit,—in fact, the demon of Richelieu. Although the latter never procured for his monkish friend the cardinal's hat which he demanded, still the people called Father Joseph his 'gray eminence,' at once to distinguish him from and assimilate him to his 'red eminence' the cardinal. They had been friends from youth; congenial spirits in ambition, depth, and talent: the monk, however, sacrificed his personal elevation to that of the cardinal. Richelieu was much indebted to him: it was Joseph that roused and encouraged him, when stupefied and intimidated by the invasion of Picardy; and it was said that after his death Richelieu shewed neither the same firmness nor sagacity. When Father Joseph was on his deathbed, Richelieu stood by it: it was a scene such as a novelist might love to paint. The conversation of the two ecclesiastics was still of this world; and the cardinal's last exhortation to the expiring monk was, 'Courage, Father Joseph, Briach is ours!' a form of consolation characteristic of both."

The following is also characteristic:—"A short time before the death of the late king, his young son of five years old, the dauphin, was brought to his bedside. 'What is your name?' asked the languid monarch. 'Louis the Fourteenth,' replied the boy, who had early learned the secret of his dignity. 'Not yet, not yet,' observed his sire."

There is much truth in the next remark. Speaking of the disputes during the times of the Frondeurs:

"It may be asked why the chiefs of the judicature, and such upright lovers of liberty as Molé, were opposed to the convocation of the states-general? The answer is, that the example of England, then in the mouths and minds of many, terrified them, and made them prefer their own body as a constitutional check, to such a representative assembly as that which,

in the neighbouring kingdom, had begun with civil war, and ended in regicide and despotism. It must be owned they had some cause for fear. A revolution is bad enough; but an imitative revolution, a parody of such a great event, is to be deprecated tenfold, as incurring all the evils and few of the advantages of the convulsion."

We do not agree with Mr. Crowe in his view of the *Fronde*; when he says the French parliament were "deterred by the extravagance of the English one," we think he takes up a theory of motive not at all in accordance with the thoughtless, violent, and often purely picturesque, spirit of the age. Writers who live in a time when rights are subjects of daily discussion, and liberty not only understood, but a good deal acted upon, are very apt to judge other times as if their own lights had then existed. We must also observe, that Mr. Crowe keeps singularly out of sight that love of effect, which is so strong a principle in the French character, and which gives such a melo-dramatic tone to their annals. We utterly dissent from the ensuing declaration on arriving at the times of Louis XIV.; the writer says:

"The philosopher's eye disdains to contemplate a scene where the petty motives and acts of private life must be produced on the public stage, and where the fate of empires must be traced to causes better calculated to string together the incidents of a novel."

This is a conclusion as sweeping as it is false. Human nature is equally human nature, whether in its littleness or its elevation; and, whatever the philosopher may think, the historian can consider nothing below his notice which traces an effect to a cause, and warns one generation by the vices and follies of another. The following view of the motive which led to Louis the Fourteenth's next marriage is equally contrary to the memoirs of the times and the monarch's own character:

"Louis looked around, and, selecting no longer with the eye of passion but of reason, took for a wife the governess of his illegitimate children. This was Madame Scarron."

We doubt whether there was not rather more flattery, intrigue, &c. in the case than reason. We now proceed with our extracts.

"There is no more important political truth than that the continuance of an aristocracy is incompatible with despotism. Physical existence or prosperity is not sufficient to uphold a privileged caste. It must have, moreover, a spring of intellectual activity, that is, interests to defend, and the means of defending them. When those, or when the latter fail, then commences their decline; such was the case of the Roman nobles after Augustus, of the French after the *Fronde*. An elective, or constitutional, or a feudal monarchy, are the only forms compatible with an aristocracy. Hence, the absurdity of the French noblesse in seeking to restore the *ancien regime*; they but struggled to die over again."

The principle of Jansenism lay deeper; its doctrines went to render the national church in many respects independent of Rome, and, moreover, to free the consciences of men from the arbitrary will of their spiritual confessors, by establishing a code of morals, founded indeed on Scripture, but superior to the glosses of its teachers. The Reformation was the first great attempt to shake off the authority of Rome: although successful, it was not without its blunders, its inconveniences, nay, its crimes; and, its first fervour over, there was little hope of its gaining proselytes, at least in France, where Calvinism, connected with rebellion, and spurning a hierarchy, excited disgust in the

well-born, distrust in the ignoble. Still there was a tacit protest in the French mind against Rome and its usurpations. Jansenism was the expression of this protest; but so feeble was it, so timid and involved its aim, hidden in obscurity of words, that when greater questions arose, it was swept away, and so erased, that unless closely examined, it appears to be a mere logical dispute."

Good condensed summary of the causes tending to the revolution. "The very men who lived in those days began to perceive the movement; not only the philosopher and reflecting man, but Louis XV. himself. 'The monarchy is very old,' said he, 'but it will last my time': a selfish remark, no doubt. But could he have stopped the current of its decline? And was not his conscious powerlessness, more than his selfishness, the prompter of his thought? His subjects, his compatriots, took precisely the same view: nor class nor individual knew whither they tended; but all were dissatisfied and ill at ease. A change was necessary, it was inevitable: the acts of every one—of king, of priest, of minister, of noble, of parliament, of writer—all henceforth worked to bring about and hasten this change. The king degraded royalty by his dissoluteness, and weakened it by his profusion. The minister, turning away from the task of internal administration in disgust, directed his views abroad, and sought to gild his day of triumph by the trophies of a war, undertaken under some idle pretext of supporting the balance of power. The noble, like the monarch, degraded his order, and shewed himself pressing on the lower classes, not for any public end, but for his own private gratification. The legists defended the cause of religious liberty and their own independence, indeed, but did so selfishly and blindly. The writer flattered royalty and aristocracy, and, at this price, was allowed to attack religion, the court finding itself in opposition to the priesthood. The priesthood itself increased its odium as a privileged class, by its intemperance, its ignorance, its absurdity, and its scandal. In such a general abandonment of the ancient system, such a despair of supporting it, it is absurd to ascribe to any particular class the catastrophe in which the epoch ended. None set about revolutionising *intentionally*; but each stirred when it found its place irksome; each, where and how it had the power. As the noblesse had proved male-content at one time, the magistracy at another, so now a new combination of society, the lettered class, rebelled with better success, for universal sympathy supported them; and step the first was taken in revolution."

This revolution, so important in itself and its consequences, begins at the conclusion of the volume now before us. We shall refrain from its analysis till we have the whole; and, for the present, must say, that the first two volumes of the *History of France* are among the very best the *Cabinet Cyclopaedia* has yet put forth. Mr. Crowe is a man of talent: he thinks as well as compiles.

A Biographical Memoir of the late Dr. Walter Oudney and Captain Hugh Clapperton, both R.N. and Major A. Gordon Laing, all of whom died amid their enterprising Endeavours to explore the Interior of Africa. By the Rev. T. Nelson, M.W.S. 18mo. pp. 150. Edinburgh, 1830, Waugh and Innes; London, Whittaker and Co.

THIS is a small but very striking volume, containing concise biographies of the three distinguished Scotsmen whose names are given in

the title-page. Those of the two former are derived from personal intimacy and near and authentic sources; the latter is more of a compilation; but the whole will be read with much interest by every class of the community.

As the public, however, is well acquainted with the outlines of their personal memoirs, and the details of their several expeditions, we shall not repeat such particulars (all of which, indeed, have appeared in our own columns), but confine ourselves to a few extracts which possess the greatest degree of novelty. The following is from a letter of Dr. Oudney to Professor Jameson, dated Mourzuk, June 6, 1822.

"I have anxiously searched for springs, but have found none fit for an accurate result. The whole country is a spring, if I may use the expression, for water comes bubbling up on digging a few feet; its temperature then is affected by the earth, and the heat indicated is of no use in ascertaining the mean temperature of the place, and consequently its elevation. The abundance of water in a country in which rain scarcely ever falls, and in which there is no dew, is a curious and interesting circumstance to the philosophic inquirer. It is not generated in the earth, and it cannot be supplied by the sea. From whence then does it come? Is it from the tropical rains? or is it from rivers lost in the earth? The supply is constant, and the wells yield as much at one time as another. The supposition that appears most probable to me is, that the countries to the southward are much higher than this; that during the rainy season water penetrates a considerable way into the earth, till it meets with strata resisting its farther descent, and then that it flows along these like a river to far distant countries. My explanation may be censured, but still, on reflection, I regard it as the most probable that I can think of. There is another interesting feature in Fezzan, namely, the constant formation of salt on the surface of the sand. In travelling along, the different stages of the process are very distinctly observable. First, a thin crust is formed like hoar frost, and this continues to increase in thickness. In some places the layer of salt is a foot deep. At present I must defer the explanation of this phenomenon till I shall have time to enter upon the description of the geological structure of Fezzan."

Upon the above theory of water, we may observe, that it seems to strengthen Sir Rufane Donkin's idea of the Niger being absorbed under ground, and flowing along strata exactly as Dr. Oudney supposes. It is much to be regretted that nearly all the materials collected by Dr. Oudney have been lost.

Of Clapperton, the writer says:

"No memoir of his life has yet appeared at all worthy of him. We have seen in one periodical an atrocious libel upon his memory, the emanation evidently of a mean and malignant spirit. Any newspaper notices of him which have been printed are meagre in the extreme; and the 'Short Sketch' which is prefixed to the Journal of his Second Expedition, and purporting to be the work of his uncle, a colonel of marines, although the best account of him which has yet appeared, contains exceedingly little that is really interesting. Such being the lack of materials, we regret much that we shall not be able to produce a memoir adequate to the subject; but we can assure our readers that we have used all diligence to obtain the most accurate and ample information which can now be had, and shall therefore proceed to submit it to their candid consideration."

After narrating his birth, family, education, &c. and his early sea service, Mr. Nelson tells us—

"After Sir Edward Owen was appointed to the command of the British naval force upon the Canadian lakes, he gave Clapperton an acting order as a lieutenant, and appointed him to the command of the *Confiance* schooner. This was a situation, which, as it implied more responsibility than any he had hitherto held, likewise allowed him a greater degree of liberty than he could have enjoyed had he been assigned a birth on board of a vessel commanded by a superior officer. When, therefore, he had the command of the *Confiance*, he was in the habit of making excursions into the forests on the coast, both of lake Huron and lake Erie, for the purpose of shooting game. While engaged in these excursions, he cultivated an acquaintance with several of the Indian tribes. The romantic turn of his mind led him not only to delight to associate with those aboriginal inhabitants of America, but also to adopt their manners and customs, and even to acquire their language. He became a great favourite among them; for he sometimes treated them with feasts, and on these occasions they used to fire a *feu de joie* in honour of him as their benefactor. At one time, indeed, he entertained serious intentions of uniting himself to the Indians, marrying a princess, and thereby becoming a chief amongst them; and actually assumed the distinctive badge of the Huron nation. This romantic and foolish design was, however, soon relinquished; but the feasts which he had given to the chiefs led to deficiency in his accounts to the victualling department, and this deficiency was afterwards deducted from his half-pay, and was the means of involving him in pecuniary difficulties, from which he was not altogether relieved till after his return from his first expedition from Africa."

His character is further illustrated by the following account of him in Edinburgh, during one of his "leaves of absence."

"Here, being an entirely idle man, fond of adventures withal, and in a place where they might easily be found, he soon had a hand in some curious scenes. Having little idea of economy, and not being well acquainted with the value of money, and indeed caring nothing for it whatever, provided he got enough to serve his purposes at the time when it was wanted, the quarterly items of his half-pay did not last him long. Indeed, he entertained some singular notions on the subject of borrowing money; and when he had recourse to his friends for a supply, he gave them to understand that he was doing them a favour by becoming their debtor. As an instance of the careless way in which he parted with his money when in Edinburgh, we may mention the following incident. At this time, a young man, the son of a staunch anti-patronist, was figuring away in this town as a popular preacher, in which capacity he became so notorious, that week after week he was puffed in the newspapers, and was attended by vast crowds on Sunday, when he held forth in a well-known chapel of ease. This person happened to meet Clapperton one day just after he had drawn his quarter's pay, and he immediately laid a plan, and forthwith commenced the putting of it in practice, for the purpose of getting possession of a considerable share of it. He said to Clapperton that he had that day met with a great disappointment, in not getting from his friends a remittance of money which he had expected; that now he would not get it before Monday; or would he have cared for the delay of a day

or two, had he not promised to pay his tailor's account, and regretted exceedingly that he should not be able to do it, as he was a lover of punctuality, and was anxious above every thing to keep his word. At the end of this fair speech, Clapperton asked his reverend friend how much money would serve his purpose, and was told that ten pounds would do all he wanted, till he heard from his friends on Monday. Clapperton, believing the man to be honest, gave him the sum specified, when the reverend gentleman asked him to go to Barclay's hotel, and he would treat him to his dinner. Away they went. An excellent dinner was set upon the table and discussed. Madeira, champagne, and other expensive wines, were called for, and the two got cheerful, joyous, happy, glorious. At length the swindler, as he proved to be, made some pretence for going out for a little. He went, but never returned; and Clapperton, in addition to the ten pounds which he had given him, never to see again, had a bill of between two and three pounds more to pay before he could leave the house."

As Lander, Clapperton's faithful servant, is now engaged in pursuing a similar mission to that in which his master perished, we copy the short notice of him at page 98.

"This man had been a wanderer from his youth. When only eleven years of age, he accompanied a mercantile gentleman to the West Indies. He was absent three years; and on his return went to France and other places on the continent, as a gentleman's servant, and continued abroad in that capacity till his nineteenth year. On his return home, he did not stay long in his native country, but went to South Africa with Major Colebrook, and traversed, along with that gentleman, the whole of the Cape colony, from one extremity to the other. The reason why he left Major Colebrook has not been made public; but, on his return to England in 1824, he heard of Captain Clapperton's second expedition to the interior of Africa, and regarding the adventure as something peculiarly suited to his roving disposition, he went to the captain and tendered his services, which were accepted."

With this we conclude, and warmly recommend the little volume to our readers. The author's style is his worst fault, in consequence of many of his periods being unconscionably long; but, nevertheless, the meaning is obvious, and the matter peculiarly interesting.

The Life of the Right Rev. Thomas Fanshawe Middleton, D.D., late Lord Bishop of Calcutta. By the Rev. Charles Webb Le Bas, M.A. &c. &c. 2 vols. 8vo. London, 1831. Rivingtons.

THE great utility of this work would have been more truly felt, and more deservedly appreciated, had it made its appearance some years ago. It is of little positive service to give information of the nature, or draw attention to the existence, of difficulties that once threw their impediments in the way, and became as stumbling blocks in the path we were about to journey, long after these have been mitigated, if not wholly removed. These volumes, had they been laid before the public immediately upon the decease of Bishop Middleton, would, as conveying the experience of a man who first encountered the many obstacles, and was, therefore, the more capable of pointing out the way to surmount them—would have been invaluable to all whose duty called them, or whose desire urged them, to labour in the Christian cause among the myriads of India.

The plain narrative of a predecessor is, in every course of life, productive of benefit, and the best source whence the thirst for useful information may be slaked; but when the region we are about to enter is unknown, and the path in which we are to follow has been trodden but by one, the experience of that one is of the highest practical importance. Such is the case with the life of Bishop Middleton, the first Protestant bishop in India. The life of a successor has supplied that intelligence which was to have been expected from his precursor. The work contains principally the actual business of the Indian church. We quote the following passage as indicative of the hindrances by which the zealous must expect to be partially thwarted.

"In other respects, the scene to which the bishop returned from his travels did not promise similar satisfaction or encouragement. In the first place, it was impossible for him to observe without pain that fresh dangers seemed to be arraying themselves against the cause of genuine Christianity in India, and from a quarter that, of all others, might have been the least suspected. A Brahmin, by the name of Rammohun Roy, had recently renounced the grosser absurdities of his national creed, though without becoming even half a convert to Christianity; and his first considerable exploit in his new character was to publish an 'Appeal' to the Christian world, to extinguish what he was pleased to term the *polytheism* of the Trinity! 'And, certainly,' says the bishop, 'he makes out his case quite as well as Lant Carpenter or Belsham. It was but the other day that Christians were considered as bound to be cautious how they attacked the follies of the Hindoos; nay, indeed the feeling still prevails—and now a Hindoo comes forward to reform Christianity, and to attack the follies and prejudices of the whole Catholic church of Christ, whom he denominates a *sect*.' That the light which had dawned upon himself might not be hidden from his countrymen, Rammohun, it seems, was busy in translating his work into the native languages, for the instruction of his countrymen. And what was the most curious particular of the whole history, it was understood that he had derived material assistance in its composition from a Christian, who had been formerly of the baptist persuasion, but who, in attempting the conversion of the Brahmin to the doctrine of the Trinity, became himself a convert to the deism of his catechumen, and actually set up a Unitarian chapel in Calcutta! 'It is unquestionably my duty,' says the bishop, 'to take up the question, provided I can find time for it. But a slight answer would be worse than nothing: it requires a volume. The writing, however, of a volume is not the whole difficulty; the printing is as difficult; for the expense here is ruinous—three times what it is in England: and, besides, there is no sale. I question whether, according to the prevailing notions here, the bishop could print for sale. If it were not treated as trading, it would be thought mean: he ought to give away all the copies; to which there is this objection—that thus they who will not read a book possess it, while they who want it, go without.' It will easily be conceived that a circumstance like this must have been deeply distressing to a person like Bishop Middleton, whose whole faculties were wrapped up in the one grand purpose of his mission, and whose spirits were kept in a state of perpetual excitement by the multitude of harassing anomalies with which his peculiar situation surrounded him."

We give the contrast of character between Bishop Heber and Bishop Middleton.

"The loss of such a man as Bishop Middleton irresistibly invites us to a momentary contemplation of the distinguished prelate who was selected to supply his place. The imagination can scarcely, perhaps, picture a contrast, in some respects, more striking than that which was exhibited in the characters of Bishop Middleton and his successor. It is, nevertheless, such a contrast as may well exist between two great and good men. Many qualities they had in common with each other. Each was distinguished by rich and various mental accomplishments, by a noble and almost saint-like disregard of mere personal interest, and by an entire dedication of himself to the holy cause which called them forth from their country. But in the general 'form and pressure' of their minds, they were totally dissimilar. The soul of Heber was essentially poetical: he surveyed with the eye of a poet all the regions both of art and nature—the achievements of man, and the works and word of God. The power of poetry descended upon his dreams, and visited him in his private meditations and devotions, and often shed a celestial radiance over his ministrations in the sanctuary. In Bishop Middleton the imaginative faculty was far less predominant: his chief endowments were a profound and penetrating sagacity—a vast strength of purpose—a robust frame of mind, less fitted to pursue the bright creations of fancy than to wrestle with severe truth, or to grapple with the stubborn realities of life. The characters of these two men may, perhaps, be said to have borne towards each other a relation somewhat resembling that which painting bears to sculpture—the canvass delights in the glow and richness of vivid colouring, the intricate vicissitudes of light and shadow, and the endless combination of objects and variety of distances. All these the marble rejects. It may be able, indeed, to bear the impress of every passion which can agitate our nature, or of every excellence which can dignify it; but the effect is always, more or less, accompanied by something of a sober and austere simplicity. It is, perhaps, scarcely too fanciful to surmise that, of those who intimately knew each of these eminent worthies, there might be some who would so far enter into the spirit of this comparison as to desiderate a painting of Heber, while they regarded a statue as the more appropriate representation of his great predecessor. The same contrast which ran through their moral nature prevailed in their intellectual. The souls of both were thoroughly pervaded by a solemn sense of Christian duty; but this principle was displayed according to the different temperaments of the men. In the one, it often took the form of steady and inflexible resolution; in the other, the aspect of facility and mildness. The one seemed incessantly watchful over himself, lest the pleasure of compliance should betray him into the surrender of something which duty commanded him to maintain: the other appeared fearful lest the responsibilities of public life should make him insensible to the feelings and the wishes of men whose worth entitled them to respect. The one was on his guard against the suggestions of easy and mistaken benevolence: the other was fearful lest official integrity and firmness should petrify, at last, into obstinacy and self-will. Different, however, as these individuals were, it would seem to have been providentially appointed that two such men should appear in India, in the order which actually occurred. Without the unbending

constancy of Bishop Middleton, it is very doubtful whether the foundations of the episcopal church could have been solidly and permanently laid. But when that great work was once accomplished, the same degree of stern energy might not, perhaps, be so absolutely essential for carrying on the superstructure, and applying the decorations and executing the details of that mighty and glorious design. When Bishop Heber arrived, the most enlightened portion of the Anglo-Indian public had been taught to regard the episcopal establishment with deep respect. The commanding qualities of the first bishop had secured for it the veneration of the community. It is not, therefore, altogether surprising that his successor should feel himself the more at liberty to follow the native impulse of his temper, and to choose the kindlier office of engaging in its behalf their cordial attachment and fidelity. And never surely was any human being more consummately adapted, than that successor, for the office of winning the affections. The singleness of his heart, the simplicity of his manners, the heavenly sweetness of his temper, the passionate devotion of all his faculties to the work of an evangelist—seemed to bend towards him the hearts of all the people, as the heart of one man. They who were at first surprised at the unostentatious plainness of his demeanour, were soon overpowered by the vast resources and genuine dignity of his mind. The result has been, that in the course of twelve years the labours of these two men have surrounded the Indian church with reverence and affection, and have associated episcopacy in the public mind with every thing that is admirable in learning and genius, or sublime in piety and virtue."

We have only to observe, in conclusion, that the details of Bishop Middleton's labours are rendered interesting to their utmost, by being garbed in the eloquent and perspicuous language of Mr. Webb Le Bas.

The Chancery Suit: a Comedy, in Five Acts. By R. B. Peake. 8vo. pp. 86. London, 1831. E. Bull.

THE publication of a genuine and acted comedy may now-a-days be hailed as a rare occurrence, and we welcome our clever friend, R. B. Peake, to the closet accordingly. The reading of his *Chancery Suit* has confirmed our favourable impression on seeing it performed: it is light, gay, and pleasant, with enough of story to make it interesting, enough of wit to make it amusing, and enough of situation or incident to keep the attention always alive.

The Royal Register, Genealogical and Historic, for 1831. By P. J. Burke. Pp. 226. London. Jennings and Chaplin.

THIS volume is very prettily got up, with another version of the Queen, from Green's miniature, engraved by F. Engleheart, as a frontispiece. The letter-press consists of an adaptation of the *Almanac de Gotha*, with considerable additions, and exhibits lists of the sovereign princes of Europe, with the living members of their families; of princes not invested with sovereign power; of ministers of state and the *corps diplomatique* at the different courts; and the commencement of an historic outline of the sovereign houses of Europe, which is promised to be continued in future volumes. On reference, we find this Register full of useful information on the subjects it embraces, though we observe some slight errors and inaccuracies of the press. In the title-page we should like to

know why "historic" should not terminate with an *al* as well as "genealogical," were it only for uniformity's sake?

The History of Rome, by B. G. Niebuhr. Translated by Julius Charles Hare, M.A. and Connop Thirlwall, M.A. Vol. I. Second edition, revised, with the Additions in the third edition of the original. 8vo. pp. 615. London, 1831, J. Taylor; Cambridge, Deighton; Oxford, Parker.

THE enlightened and indefatigable Niebuhr died at Bonn, on the 2d instant, at the premature age of fifty-three, without having completed this admirable history, the manuscript of nearly the whole of the last volume of which had not long before been accidentally destroyed by fire. The author had returned with energy to repair his severe loss, but death arrested his progress, and the world is deprived of the consummation of his labours.

In noticing this new edition of the first volume, it is unnecessary for us to revive the cavils and disputes which attended the original publication: suffice it to say, that the author, and consequently his translators, have strengthened some of the positions most attacked, and corroborated some of the results which the preceding data did not (it was alleged) sufficiently support. It is now, therefore, a work of still greater merit than before; and before, it was one of the most striking productions of the age.

Familiar Analysis of the Calendar of the Church of England, &c. &c. By the Rev. Hugh Martynale, A.M. London, 1831. Effingham Wilson.

CONSTRUCTED as a perpetual Guide to the Almanac, in the form of question and answer, this publication boasts of much to amuse as well as to instruct the reader. It seems to be carefully and judiciously compiled; and we can fairly recommend it as a fit present for the young.

The Constable's Assistant. Pp. 52. London, 1831. Saunders and Benning; Rivingtons; Hatchard and Son.

THE utility and value of this pamphlet (published by the Society for the Suppression of Vice) can hardly be appreciated from its slight form and humble title. It is, however, a most meritorious work; not only teaching constables their important duties, but the public at large how to judge of them, to aid in them, and to benefit by them. Few persons can have an idea how advantageous this knowledge would be to the best interests of society: we assure them it would be productive of most excellent effects; and we call upon the well-meaning to join with us in recommending and diffusing this Blackstone of its kind.

Maunder's Treasury of Knowledge and Library of Reference. Parts I. and II. 18mo. London, 1831. S. Maunder.

ALTHOUGH nine months only have elapsed since we awarded to Mr. Maunder our honest praise for the ability he had shewn in producing this truly admirable volume, which we then described as the cheapest and best extant—a third edition (and with additions of value, too), as beautifully printed, and at the same low price as before, has just appeared.

We are not surprised that a book so generally useful, and, withal, so amazingly cheap, should have already obtained a most extensive sale; for it is just that kind of article which suits every body, and is worth every body's

money; in fact, there does not appear to be two opinions on the subject, for we find that all our critical brethren fully concurred in the view we took of *Maunder's Treasury of Knowledge*; and many of them expressed themselves in terms far more eulogistic. Surely this ought to be sufficient encouragement to the compiler to proceed with his intended series, for the execution of which no person can be better qualified.

The History and Topography of the United States of North America, from the earliest period to the present time. Edited by John Howard Hinton, A.M. Parts 2, 3, 4, 5, and 6. Hinton; and Simpkin and Marshall, London: Wardle, Philadelphia.

On the appearance of the first part of this work we expressed our favourable opinion of it; an opinion which the five succeeding Parts have confirmed. For the reason we have already stated, namely, the disjointed form of the publication, we are unable, at present, to enter into an examination of the literary portion of the work; but, after its completion, we shall probably take an opportunity of doing so. Some of the plates are eminently beautiful.

Stories from the History of Italy, in a connected Series, from the Invasion of Alaric to the present time. By Anne Manning. 12mo. pp. 359. London, 1831. Baldwin and Craddock.

THIS is a very pleasant little volume, and a very pretty one too, with a sweetly engraved frontispiece. We recommend it to our young readers, as embodying, in a popular form, most of the interesting and romantic events in Italian history. We extract a pathetic observation of Cosmo di Medici, while labouring under the affliction of his second son's decease—"Being carried through the apartments of his palace, he said: 'This is too great a house for so small a family.'"

Dr. Lardner's Cabinet Library, Vol. II. George IV., Vol. I. Longman and Co.

WE have devoted so much space to France in another of Dr. Lardner's "Cabinet" volumes, that we can only afford room to notice this (for the present) as very ably written. We shall examine its other qualities, anon.

Geraldine of Desmond: an Historical Romance. 3 vols. 12mo. Second edition. Colburn and Bentley.

NEARLY a hundred *Gazettes* ago (which is a new way of computing time—see No. 646), we noticed this romance, by Miss Crumpe, who certainly chose an interesting period, and a memorable episode in the history of Ireland, on which to found her romance—for the age of Elizabeth, and the feud between the houses of Desmond and Ormonde, well deserve these characters. Remarkable on the minutiae of the details into which a perhaps too anxious research among the older writers led the fair author, we gave her credit for a good style, and many spirited sketches. To this merit she has now added, by way of illustration, a selection of curious autographs; and some of her notes throw light upon the era. For example, she derives the name of our London street "Piccadilly" from ornaments called "peccadillies," sold there, and worn by Queen Elizabeth in her hair. She explains the word "sugars," applied to a Lord of Desmond, to mean a "lord of straw;" but we are not sure of this,

and are rather inclined to think it meant a brother by what in Germany is styled a left-handed marriage. The individual in question was, we fancy, a half-brother of the great Desmond. But enough of a second edition, to which we refer rather in justice than of custom: since we sometimes mention those which bear out our favourable report, it is due to do as much for a publication, the success of which has exceeded our expectations.

ARTS AND SCIENCES.

SOCIETY OF ARTS.

THE second "evening illustration" of the present session was given on the 25th ult. by the secretary, Mr. Aikin. The subject was the manufacture of silk, being the continuation of a paper by the secretary read last session. In that, after some historical notices respecting the introduction into Europe, first of manufactured silk, and afterwards of the animal that yields the raw material, a general sketch was given of the management of the silk-worm, of the method of winding the silk off the cocoons, and of converting the raw silk obtained into the two kinds of thread employed in the manufacture of this substance, namely, tram and organzine.

There remains to be described, said the secretary, the methods of boiling, bleaching, and dyeing silk, and of manufacturing it by the loom into the various fabrics of use, ornament, and luxury, for which this beautiful material is so eminently adapted. The latter alone of these subjects was discussed on the present occasion.

The secretary began by observing, that the texture of plain woven cloth differs in no essential respect from matting or basket-work; both of them consisting of a number of parallel threads or twigs, united together by others at right angles to the first, and laid in alternately above and below each of the former.

The most ancient looms, or rather weaving frames, were vertical, and probably extremely similar to those at present in use in the Barbary states, and in some parts of India. A model of the latter, from the East India Company's museum, was exhibited, with the several implements required in its use; and a very interesting comparison was then made of these with the descriptions of weaving left us in the works of the Greek and Roman writers. A short statement of the different kinds of fabrics capable of being made in the vertical loom, was then given. The description of the common, or horizontal loom, succeeded, and its advantages over the vertical loom were pointed out. The principle of all the kinds of woven structure was then stated in detail, and illustrated by drawings and diagrams; namely, that in plain cloth the angle of the shed formed by the warp threads, and within which the cross threads, or shoot, is laid, is formed by raising every other thread of the warp, and depressing the alternate ones,—so that the number of threads above and below the shoot shall be equal and alternate. Whereas, in all kinds of figured weaving, the number of warp threads above and below the shoot is not equal, nor is their arrangement simply alternate.

The loom with many treadles was next described, and the contrivance of easing the weaver of the labour of raising them, by the substitution of a *draw-boy*.

The use of harness and lashes in place of treadles was next described, and the structure of the jacquard, or Lyonsese loom, was demonstrated on a very beautiful working model.

Many other interesting models were exhibited, particularly a riband loom, in actual work.

A splendid series of specimens of almost every variety of silk fabric, both French and English, was then shewn, and their essential characters described; and the business of the evening concluded with the exhibition of some splendid gold and other tissues of Malay manufacture, furnished by the liberality of the directors of the East India Company.

The strength of the Society of Arts chiefly lies in the extensive connexions that it possesses with the commercial and manufacturing part of the community; and it is most gratifying to observe the harmonious concurrence of all parties in furnishing information, models, and specimens, to enrich these very interesting and crowded meetings of the Society and its friends.

COLLEGE OF PHYSICIANS.

THE first evening meeting of the season, at the College of Physicians, appeared to be an object of attraction to members of each of the three learned professions. Sir Henry Hallford, Bart. the president, was in the chair; and the meeting was attended by many persons of eminence in church and state, amongst whom were the Archbishop of Canterbury, the Lord Chancellor, Baron Falk, Earl Stanhope, the Bishop of London, Baron Vaughan, Mr. Justice Park, Mr. Justice James Park, the Vice-Chancellor, the Attorney-General, Sir R. Inglis, Mr. C. Wynn, the Dean of Chichester, Dr. Goodenough, Dr. Phillimore, &c. &c. A paper was read by the president, and was listened to by his audience with great interest and satisfaction; for, in addition to the eloquence of its style, and the animation with which it was delivered, the subject of it was happily chosen, being one of universal interest which could not fail to "come home to men's business and bosoms;" and the sentiments which it contained respecting the moral conduct and right behaviour of physicians in situations requiring discretion and good sense, came with propriety and authority from a gentleman of much experience, distinguished for his success in practice, as well as for his station and influence in society. The President commenced by noticing the elegance of Sir George Baker's essay on the effects produced on the body by the passions of the mind, and recommended to the attention of his hearers the converse of that subject; viz. the influence of the body upon the mind; which is so considerable, that an experienced physician can often assign the malady under which a patient labours, from knowing only the condition of his mind. What can be more different, he observed, than the mental state of a person suffering under a fit of indigestion, and that of one affected by a slight inflammation of the brain, when the excited patient is ready to

"Pluck bright honour from the pale-faced moon!"

By apoplexy the mind is altogether confounded; but the effects of palsy on the mind are very remarkable—the passions appear to be let loose (especially when they have been previously ill regulated), and the patient is irritable, and roused into anger, or melted into tears, alike without reason. Such was the unhappy state of Marlborough and of Swift—

"From Marlborough's eyes the tears of dotage flow;
And Swift expires, a driveller and a show."

Of epilepsy it was remarked, that when long continued, and when it originates from disease of the brain itself, it passes into idiocy; not so when it arises only from some passing irritation, as from an oppressed stomach—so far Julius Caesar and Mahomet are said to have

been epileptic. We were particularly struck with the sketch which was given of the cheerfulness of mind often exhibited by the poor victim of pulmonary consumption, contrasted with the dulness and torpor of the female labouring under climacteric disease. Disorders of the heart, too, it was observed, do not constantly oppress the spirits: whether this be owing to a special allotment of Providence, or whether it should be referred to the general principle which Paley has stated with respect to pain—that it has the power of shedding satisfaction over intervals of ease, which few pleasures can surpass, and thus of converting remission of suffering into positive enjoyment. That pain alone does not obscure the intellect may be observed in tic douloureux, and still more amidst the sufferings of a fatal iliac passion, the horrors of which were portrayed in a very forcible manner. Sufferings less than these the Romans thought a sufficient reason for ridding themselves abruptly of life. But the Christian bears his sufferings from higher motives, and with a different spirit. It was mentioned by the president as a remarkable fact, that, of the great numbers whom it had been his painful professional duty to attend at the last period of their lives, very few have exhibited an unwillingness to die; except, indeed, from painful apprehensions respecting the condition of those whom they might leave behind. This feeling of resignation, although it might arise in some from mere bodily exhaustion, appeared in others to be the genuine result of Christian principles. And here some remarks were introduced on the proper conduct of a physician as to warning a patient of his danger. In general, the president stated, he thought it his first duty to prolong his patient's life by every possible means, and not to step out of his province, and endanger the safety of his patient by adding alarm to his mind. To the friends, indeed, of the patient he always imparted the fullest information; and they might, if necessary, awaken his fears, without altogether destroying his hopes, as he would still think there was an appeal from them to his physician. But the physician's word would be received as a condemnation to death, and thus perhaps (what was awful to think of) his very repentance might be rendered less acceptable in the sight of Heaven. Still there were cases which might require from the physician an opposite line of conduct, so that no rule could be laid down which ought not sometimes to be infringed. But if good sense and good feeling were not wanting, the difficulty in each case would not be insurmountable. Yet the difficulty must necessarily be increased when the patient is of so elevated a station that his safety becomes an object of solicitude to the nation. Bulletins, from their public nature, cannot be so explicit as the intimations intrusted to friends in private life. The former ought not to be calculated to deceive; but neither, on the other hand, ought they to contain such full information as may be given to the government and family of the monarch. In the case of our late sovereign, George IV., Sir Henry Hallford informed the government, as early as the 27th of April, that his Majesty laboured under disease of the heart, and that effusion into the chest might soon be expected; but it was not until the latter end of May that his Majesty's inquiries and solicitude concerning himself rendered it practicable to inform him of his danger. The announcement of it induced him to take the sacrament in addition to the daily religious exercise which he had long been in the habit of using;

and this last duty afforded him the greatest consolation. After this it was always possible to cheer his mind by turning it to any favourable change in his symptoms. Thus was practised that happy art of soothing the bed of death, which Lord Bacon has encouraged physicians to use; and the late king was spared from the constant contemplation of death, until a few minutes before his end, when he appeared not so much dying as sinking into a quiet slumber. The paper was illustrated by many classical allusions and apposite quotations, was heard throughout with great attention, and towards its close appeared to excite extreme interest.

It was understood that there would be five more evening meetings at the College of Physicians, to be held on the last Monday of the present and of each of the four following months.

LINNÆAN SOCIETY.

A. B. LAMBERT, Esq. in the chair. Another portion of Mr. Blackwall's paper on the structure and economy of the spider, was read. Professor Ehrenberg of Berlin, Professor Adrian, Dr. Jussieu of Paris, Dr. Ruppell of Frankfurt, and Professor Hornemann of Copenhagen, were severally proposed as foreign members. A number of fellows were elected. At the conversazione after the meeting, amongst other subjects connected with literature and the arts, which were spoken of, it was stated that Professor Buckland, Mr. Charles Bell, Dr. Roget, and others, had nearly completed their works, as competitors for the legacy left by the late eccentric Duke of Bridgewater, for the best essay on the structure of the earth and the human hand. The bare mention of the names of the above gentlemen will be sufficient to point out to most of the readers of the *Lit. Gaz.* the particular branch of science undertaken by each, viz. Professor Buckland, geology; Mr. C. Bell, anatomy; and Dr. Roget, physiology.

HORTICULTURAL SOCIETY.

DR. HENDERSON in the chair. A communication on the culture of the potato, by Mr. Knight, the president of the Society, was read by Mr. Lindley. The author seems to think that a great deal more might be done with this valuable, though, by some economists, much traduced, esculent. He then goes on to shew that by picking the blossoms as soon as they become visible, the tubers will be considerably increased; a fact in horticulture, by the by, which was noticed in a former No. of the *Literary Gazette*. In this mode the author trained a young seedling plant, in a shady situation of the stove-house, till it grew between four and five feet high: he then removed it to the open ground, covering the entire stem with mould: by these means he obtained, within the first year, one peck of potatoes from the single plant. Mr. Knight concludes by observing, that if the potato were more generally used as food for cattle, the quantity of animal food would be materially increased.

The exhibitions on the table at this season of the year are necessarily without much interest.

ROYAL GEOGRAPHICAL SOCIETY.

MONDAY.—Mr. Hamilton, in the chair. Minutes of the preceding meeting were read, and a list of donations to the Society; among which was a new ruler for drawing parallel lines with extreme accuracy, invented and presented by Mr. Jones. The principle of this instrument is the determination of the parallelism by a spirit level,

movable on the ruler by rack-work; and its adaptation was considered most ingenious and perfect when the paper on which the lines are to be drawn can be placed in a vertical or much inclined position; but without this it is inapplicable. Subsequently, several new members were balloted for, others proposed, and a long extract from the Society's Common-place Book was read; being a communication from Dr. Holland, of geographical desiderata in Greece; i. e. points to which that distinguished traveller considers the attention of future labourers in the same field would be advantageously directed: they related severally to Thessaly, Delphi, Dodona, monasteries of Meteora (in some of which the writer thinks valuable MSS. might be yet found), rocks of Meteora, chain of Pindus, Paramithia, ancient theatre near Joannina (which is surrounded by the magnificent remains of a town, to which, as yet, no name is attached on sufficient authority), the Tetrapolis of Doris, Thebes, Corinth, Argos, and Olympia. Nor can we conclude this portion of our notice without observing how extremely advantageous it would be if other travellers would imitate the example thus set them; and, by inviting attention to those deficiencies in their information, of which none can know so much as themselves, acquire the certainty of having these deficiencies more or less speedily supplied.

Two papers were afterwards read, furnished by Mr. Barrow, and prefaced by a notice inviting the attention of the Society to the great resemblance between the forms of coralline and volcanic island-formations, both being nearly always circular; whence great probability is lent to the idea that the former are uniformly based on the latter, and, instead of rising from the depths of the sea, are reared by the extraordinary insects which are their artisans, from the edges of the sub-marine volcanoes shooting up near the surface; and as exemplifications of this similitude, the accompanying papers were interesting. One was an account of the Island of Deception, one of the New Shetland group, situate in lat. 62° 55' south, long. 60° 28' west, which seems to be, in miniature, the Iceland of the southern hemisphere—no fewer than eighty-one jets of steam having been counted at once on it, and hot springs boiling up in many places from under the snow. The other was a description of the Cocos, or Keeling islands, situated about 400 miles south-west of the Straits of Sunda, in lat. 11° south, long. 37° east; in which the volcanic action seems extinguished, and the coralline formation is greatly advanced; but in both, the circular form is exactly preserved. Thanks were voted to the respective contributors of the above papers, and the meeting adjourned.

MEDICO-BOTANICAL SOCIETY.

ON Wednesday evening, Earl Stanhope, the president of this Society, delivered his annual address. It was very long, and took a comprehensive view of the domestic and foreign relations of the Society. It also, in grateful language, acknowledged his Majesty's gracious condescension in becoming the patron of the Society. On the motion of Sir Henry Hallford, thanks were voted to the noble president, and his address was unanimously ordered to be printed. The room was exceedingly crowded.

LONDON PHRENOLOGICAL SOCIETY.

DR. EDWARD WRIGHT, President, in the chair. A critical examination of Dr. Andrew Combe's "Observations on Mental Derangement" were read. Dr. Elliotson related several

ral interesting cases of diseased function of various portions of the brain: amongst others, were that of a woman, the whole of whose perceptive powers appeared to be affected; she had no distinct idea of time, and always imagined that she saw the figure of some person near her; her verbal memory was also defective:—a curious case of morbid excitement of the organs of combativeness and destructiveness in a female:—and one of a hypochondriacal subject, in whom the organ of caution was very large.

LITERARY AND LEARNED. ROYAL SOCIETY.

GEORGE RENNIE, Esq. V.P. in the chair. A paper, by Dr. Lardner, on the Linnæan theory, was read. Dr. Latham, of Winchester, the celebrated ornithologist, and now senior fellow of the Society, presented a General History of Birds, in 11 vols.

At a recent meeting a paper was read, entitled, "on a simple electro-chemical method of ascertaining the presence of different metals, applied to detect minute quantities of metallic poisons," by Edmund Davy, Esq. F.R.S. and professor of chemistry to the Royal Dublin Society; of which the following is an abstract:—

The Voltaic arrangement employed by the author consisted merely of small slips of different metals, generally zinc and platina, placed in contact and forming a galvanic circuit with the interposed fluid suspected to contain the poisonous metal; in which case, as was formerly shewn by Sir H. Davy in his Bakerian lecture, the metal held in solution was deposited in the form of crystals on the negative surface. The zinc was usually employed in the form of foil: the platina was, in some cases, a small crucible, or a spatula; but more frequently platina foil was used. It is generally necessary to mix a few drops of acid with the metallic compounds that are subjected to this test, and that are placed in contact with the platina. On applying the zinc foil, the platina will soon become coated with the reduced metal.

The author then enters into the detail of his experiments on the efficacy of arsenic, mercury, lead, and copper, in their different states of oxidation and saline combinations, and of the precautions necessary to be observed in the case of each metal. He was enabled to detect the presence of arsenic by the exhibition of its characteristic properties, when only the 500th part of a grain of that metal was deposited on the platina; and in some instances could appreciate even the 2,500th part of a grain by the application of appropriate tests.

The author next ascertained that the electro-chemical method is competent to the detection of very minute quantities of the different metals, when their compounds are mixed with various vegetable and animal substances. Thus the presence of arsenic could readily be discovered when mixed with all the ordinary articles of diet, such as wheat flour, bread, rye, rice, potatoes, peas, soup, sugar, vinegar, gruel, tea, milk, eggs, gelatine, and various kinds of wine: also when mixed with the principal secretions of the alimentary canal, as bile and saliva. Arsenious acid, mixed with butter, lard, and oils, or with sheep's blood, or bile, was detected with great ease. Similar results were afforded by corrosive sublimate, the acetate of lead, and sulphate of copper, added in a small quantity to the most complicated mixtures of organic substances. In some instances, where the common tests either do

not act at all, or only act fallaciously, the electro-chemical method acts with the greatest certainty.

SOCIETY OF ANTIQUARIES.

THURSDAY, W. R. Hamilton, Esq. V.P. in the chair.—Sir Thomas Phillips exhibited to the Society a plan of the foundation walls of a very extensive palace of King John, at Clarendon, in Wiltshire. Some letters were read from Henry VI. to the town of St. Edmund's Bury, directing the authorities to exert themselves in the suppression of the Lollards, who are accused of murder, plunder, and rapine. The secretary continued the reading of the Rev. Mr. Skinner's letters to Sir R. C. Hoare, on the site of Camelodunum.

FINE ARTS.

BRITISH INSTITUTION.

[Second Notice.]

BEFORE entering more minutely into the subject of the present exhibition at the Gallery of the British Institution, we beg to correct an error which we committed in our last notice, when we included the president's *Lavinia* among the novelties. There can be no one, however, whom it will not gratify to have a second view of so tasteful and characteristic a work.

No. 2. *Too hot*. Edwin Landseer, A.R.A.—In humour, variety of animal expression, and masterly execution, this cabinet gem has never been surpassed.

No. 3. *A subject from "The Lost Pleiad"* of Miss L. E. L. Henry Howard, R.A.—Mr. Howard has happily translated the poetry of this highly-gifted writer into the poetry of art.

No. 12. *Part of the Corn-market at Caen, formerly the Church of St. Sauveur*. D. Roberts.—Painted with extraordinary skill and facility. Nothing can exceed the beautiful effect of light, and the clearness of the half-tones.

No. 13. *Shipmeadow Lock, on the Waveney, painted for the Scenery of the Rivers of Norfolk*. James Stark.—The talents of Mr. Stark place him high in his department of art. The subject under our notice will make a beautiful feature in the publication for which it has been painted.

No. 23. *Gleaners*. W. T. Witherington, A.R.A.—We take the opportunity of congratulating Mr. Witherington on the well-deserved initials added to his name. The present is a small work, but it is an admirable specimen of his abilities.

No. 25. *Cottage Industry*. Edwin Landseer, A.R.A.—A portrait, *en profile*, of the second daughter of the Duke of Bedford, as she appeared at a private masquerade; and a countenance of more exquisite beauty, delicacy, and sentiment, we never beheld.

No. 29. *A Nutting Party*. W. Collins, R.A.—Old as we are, we should like to make one among this merry group. The secluded and sylvan scenery, and the mellow-toned autumnal tints, come upon us at this inclement season with tenfold attraction.

No. 31. *L'Allegro*. Alfred Chalon, R.A.—Beautiful, but artificial; certainly not *L'Allegro* of Milton.

No. 37. *The Toilet*. G. S. Newton, A.R.A.—It would have been better had the quotation from Pope been omitted in the catalogue, as there will certainly be a difference of opinion as to the "heavenly image." It would be too much to expect of any artist an equality of excellence; and we are constrained to say that this is not one of Mr. Newton's happiest efforts. In drawing, especially, it is sadly deficient.

No. 45. *The Happy Highlander*. W. Kidd.—Full of mirth and matter; and the best production that we have seen from Mr. Kidd's pencil.

No. 54. *Amiens*. C. R. Stanley.—This subject, with its picturesque contrast of irregular habitations to the stately cathedral, belongs to a class of art in which Mr. Stanley's talents have always appeared to advantage, and never more so than in the present instance.

No. 59. *Titania, Puck, and Bottom; Midsummer Night's Dream*. John Partridge.—This picture has been exhibited before; but it was so hung that it could not be seen. It possesses a fine glow of colour. The ideality of Shakespeare's fairies presents no very easy task for the pencil. The naked substantiality of their queen in this composition is scarcely accordant with a being, who

"—the globe can compass soon,
Swifter than the wand'ring moon."

No. 64. *Windmill, Kent*. F. R. Lee.—No doubt a faithful representation of the place, without any attempt at composition, but wrought with such skill, and made up of so many varied, yet harmonious, hues, as to be altogether captivating.

No. 76. *Sketch of a subject for an Altarpiece; Martyrdom of some of the early Christians*. W. Etty, R.A.—A display of composition and colour that may vie with some of the best works of the Venetian or Florentine schools of art. It shews of what English genius is capable in the higher walks of art, if the taste of the times were prepared to encourage its efforts.

No. 80. *Captain Macheath*. H. Liverseege.—The author of the admirable novel of "Paul Clifford" ought to purchase this spirited representation of Gay's hero.

No. 81. *The Young Devotee*. A. G.ickers.—Full of taste, with a delicious tone of colour.

No. 95. *Falstaff's Assignment with Mrs. Ford; Merry Wives of Windsor*. G. Clint, A.R.A.—Falstaff says, "I am not only witty in myself, but the cause that wit is in other men." Of graphic wit the fat knight has undoubtedly been an abundant source; and the present is a very pleasant example of it. Mr. Clint has exhibited the old voluptuary in the supposed triumph of his amorous design; while the quiet, but significant, look of Mrs. Ford is in perfect accordance with the trick which she is about to play him. The interior of the apartment, and the arrangement of the accessories, are excellent; and we have no hesitation in saying, that we consider this as one of the most successful works that have been founded on the prolific subject.

No. 96. *Spaniel Puppies*. Stephen Taylor.—There is great truth and nature in the awkward gambols of these unshaped cubs.

No. 106. *The Culprit*; No. 113. *The Catholic Question*. T. Webster.—Boyish mischief and scrapes continue to be the favourite subjects of this clever artist's pencil; and we have never seen him more successful than in the present pair of whimsical productions.

No. 129. *The Advertisement*. T. Clater.—This is not only a well-painted picture, but a well-told story. A stray dog having been found by a boy, a cobbler and an old Chelsea pensioner are examining a newspaper, in which the marks of the animal are described, with an accuracy which is very apparent in the complacent countenance of the youthful finder, who is anticipating the proposed reward for its restoration. The composition, character, and execution, of this little picture are admir-

able, and the effect is exceedingly concentrated and powerful.

No. 147. *Cavalry attacking a Battery of Guns*; No. 158. *Cavalry attacking and retreating*. T. Barker.—Treated in a style perfectly suitable to the subject; in action and character equal to Borgognone; and in composition and handling to the banditti of Salvator.

No. 151. "*A guest of thoughts, all tenants to the heart.*" Shakespeare. W. Boxall.—Finally expressive of the sentiment. Why hung so low?

No. 155. *Interior of the Painted Hall, now the Picture Gallery, Greenwich Hospital*. John S. Davis.—It is with pride and pleasure we look on this palace-like interior, devoted to the pictorial representation of the achievements of our gallant tars. This picture is also a fine achievement in its way; and, combined with his former productions, has, very deservedly, procured for the artist patronage and employment. He is now on the continent, at the instance of Lord Farnborough, for the purpose of painting the interiors of the Vatican, the Escorial, and other celebrated places.

(To be continued.)

NEW PUBLICATIONS.

Characteristic Sketches of Animals; drawn from the life, and engraved by Thomas Landseer.

Part V. Moon, Boys, and Graves.

THE majestic lion of Barbary, the fierce jaguar of Brazil, the formidable Polar bear, and the shy alpaca of the Southern Andes, are the subjects of Mr. Landseer's present number; and are all executed with the utmost fidelity and spirit. The illustrative vignettes are also admirable; that attached to the description of the Polar bear made us shudder with horror; while that attached to the description of the jaguar convulsed us with laughter.

Select Views of the Lakes of Scotland, from original paintings by John Fleming; engraved by Joseph Swan: with historical and descriptive illustrations by John M. Leighton, Esq. Part II. Moon, Boys, and Graves.

LOCH-KATRINE, to which Sir Walter Scott's fine poem of "The Lady of the Lake" suddenly gave so much celebrity, forms the subject of the three views in the present number. They are all beautiful; especially that of the east end of the lake, with the mountain of Benvenue in the distance.

Library of the Fine Arts; or, Monthly Repertory of Painting, Sculpture, Architecture, and Engraving. No. I. Arnold.

VARIOUS periodical publications, exclusively devoted to the fine arts, have at different times been attempted in this country, but have uniformly failed. We hope the present undertaking may prove an exception to the general rule. The number which has just made its appearance contains much useful and pleasing information; and, if the work be carried on in the same spirit, it ought to receive the support of the professors and lovers of those arts which, in the language of the Preliminary Address, "have formed the secret and deep-cherished delight of the most amiable, the most enlightened and illustrious characters of every civilised age and country."

Sketches in Italy; drawn on stone by W. Linton. No. II. Moon, Boys, and Graves. WE were much pleased with the first number of this truly original work, as giving us the

bona fide drawings of an artist, untrimmed by the finishing, and unshackled by the precision of the burin, and exhibiting the grand and beautiful scenes he depicts with the force of truth, and the freedom of genius; but we are still more so with the second. Not only does Mr. Linton shew considerable improvement in lithographic drawing (the general consequence of practice), but the views themselves are more interesting than any which we have hitherto seen of the land of beauty, wonder, and unparalleled associations. Every view is an especial gem: Amalfi, and its lonely convent, apparently cut out of the solid yet picturesque rocks which surround it; Zagarolo, contrasting this melancholy solitude by the splendour of "a city set upon a hill," bedight with palaces, and pinnacles, and towers; Rocca di Papa, a scene of singular softness and grandeur; and Nesso, on the Lake of Como, the most secluded and romantic glen into which the prying eyes of a painter ever glanced,—by turns delight us. We yet apprehend that the Fall of Terni will be generally considered the most masterly view in the present number. In the execution of his difficult task, the artist has preserved a breadth and magnificence, both in the sweeping torrent, which falls in one continuous mass of snowy waters, and in the surrounding rocks, such as we have seldom witnessed. Should the succeeding numbers of Mr. Linton's publication equal the present, (of which we have no reason to doubt,) he may safely venture to treble his impressions; for it cannot fail to be as attractive as it will be meritorious.

The Tight Shoe; painted by H. Richter, engraved in mezzotint by himself and J. P. Quilley. Ackermann.

A SPECIMEN of Richter's humour in his very best style, and extremely well engraved. The agony of the fellow with the tight shoe appeals in vain to the obdurate shoemaker. He will not believe that his work can hurt any body; in which opinion the Chelsea pensioner, on two wooden pins, evidently agrees. The cobbler's boy, and the barber who is looking in at the window, appear to enjoy the joke of the fit, and complete the spirit of this clever composition.

Macbeth and the Witches; painted by J. H. Nixon, mezzotint by G. H. Phillips. J. Kendrick.

WE have seen nothing approach so entirely to the Martin-like character of composition, imagination, and sublimity, as this little print by an artist with whose name we were previously unacquainted. The vision is particularly fine, and the production altogether one of the highest promise.

Landscape Illustrations of the Waverley Novels.

Part X. Engraved by W. and E. Finden. C. Tilt.

THE "Tower in 1670," for *Peveril of the Peak*, by Roberts; "Linlithgow," for *Waverley*, and "Inch Cuilleach," for *Rob Roy*, by Robson; and "Locheleven Castle," for *The Abbot*, by Gastineau, are the ornaments of this beautiful fasciculus, which does equal honour to the painters and to the engravers. The "Tower" and "Linlithgow" are both fine objects; and the other two beautiful natural landscapes.

Right Hon. Elisabeth Baroness Durham. Engraved by Thomson, from Sir T. Lawrence. THIS is the 74th of the sweet portraits of female nobility which adorn *La Belle Assemblée*; and for simplicity and grace, inferior to none of the number.

ARTISTS' AND AMATEURS' CONVERSAZIONE.

ON Tuesday last there was another meeting at Freemasons' Tavern, but we are prevented from going into particulars.

CITY OF LONDON ARTISTS' AND AMATEURS' CONVERSAZIONE.

WE learn with pleasure that this Society,—a notice of which has already appeared in our columns, held its first, and a very gratifying meeting on Thursday week, at the house of Mr. Fred. Westley, in Stationers' Court, *pro tem.*, and that it has been hailed with much enthusiasm, and several of the most distinguished gentlemen in the city have voluntarily offered themselves as members. This is as it should be.

BIOGRAPHY.

JAMES CHRISTIE, ESQ.

IT is with sincere regret we announce to our readers the death of Mr. Christie. He expired in King Street, St. James's Square, on the 3d inst. after a long and painful illness, in the fifty-ninth year of his age.

It is hardly possible to speak the truth of Mr. Christie without an appearance of exaggeration, which, by those who knew him not, may be attributed to want of judgment or deficiency of taste. His education, of which the foundation had been laid deep at Eton, had ripened by study into scholarship accomplished and profound: of this his published Dissertations afford ample proof. With the polished manners and mental refinements of a gentleman, he brought to his profession a rare union of learning, science, and taste,—habits of the most perfect order, and principles of the most unbending integrity. But it is the highest praise of Mr. Christie, that in his religious life he adorned the purest doctrine by the holiest practice. A more single-hearted Christian, under every religious obligation, in every moral and social duty, never lived. Had his talents been of a more obtrusive kind, he had filled a larger space in the public eye; but on those who knew and loved him well, his unassuming merit, his great mental superiority, felt in the instruction he imparted and his sincere piety, have made an impression never to be effaced; and his death has occasioned a void, for which the rich legacy of his high and virtuous example can at present but feebly compensate.

Mr. Christie was a member of the Society of Dilettanti, a Registrar of the Literary Fund, and, we believe, belonged to other literary institutions.

DRAMA.

DRURY LANE.

MR. KEAN, after having gulled the English public into a belief that he really had taken his final farewell of the London stage, and coolly pocketed upwards of £1000, obtained from it under that pretence, as coolly re-appears, the very next season, without prologue or apology; and the said English public receive him as if nothing of the sort had occurred. Amen. The public is contented to be so gulled, and we, as veracious chroniclers, have nothing to do but to state the mere facts of the case, leaving the comments to be made by those whom it may concern. We have no doubt, however, that his next last benefit will be more fully attended, if possible, than the very last. He played *Richard*, on Monday evening, in much the

same style as he played it last season. Mr. Young deserved, and obtained, marked approbation for his performance of Henry VI. The pit and galleries were crowded from the commencement: the boxes were but poorly attended. On Tuesday, a version of Scribe's *Fra Diavolo* was produced with indifferent success. Its cool reception may be attributed to two causes. The first, its being a faint echo of the *Brigand*, which has been so long popular upon the same boards, with its hero in the same hands: the second—that the musical portion of the audience, attracted by the announcement in the bills that the original music, by Auber, would be sung, arranged by Mr. Lee, was disappointed; two songs out of Mrs. Waylett's four being the entire composition of the latter gentleman; and Mr. Sinclair's and Mr. Harley's songs also were foreign to the opera. This practice will not make perfect now-a-days. Mrs. Waylett's new ballads were exceedingly pretty, and very sweetly sung by that lady; but they were not Auber's, and their merits were therefore disregarded. The original and famous song, "Diavolo! Diavolo!" the air of which forms also the finale to the opera, was so splendidly sung by Madame Vestris, that Mrs. Waylett's comparative failure in it might have been expected. The most effective things in the opera were, the distant bugle march and chorus of the carabineers in the second act, and the choruses, &c. of the peasantry at the *fête* of our Lady of Palma, in the last scene, though the latter had also to encounter a comparison with similar effects in *Masaniello* and the *Brigand*. Wallack acted famously throughout, particularly in the finale, which we thought novel and ingenious. Mr. Latham, Mr. Bedford, and Mr. Webster, deserve honourable mention for the care and spirit with which they executed very subordinate parts. The dress of the latter was admirably characteristic. Mrs. Orger and Mr. Harley did the most they could with their respective characters. Mr. Sinclair obtained the only encore of the evening; but it was given to his delightful voice; for the song was neither good nor in keeping with the situation. The honours of the adaptation are said to be divided between Messrs. Thackeray and Shannon; but which of the twain translated *Fra Diavolo* (Devil's Brother), does not appear to be decided.

COVENT GARDEN.

On Wednesday, after *Fazio*, in which Miss Taylor performed *Aldabella*, for the second time, with great judgment and effect, having taken the part at a day's notice on the previous Monday, a new comic drama was produced, entitled *Married Lovers*. The plot turns upon the mystification and exposure of three married gallants, the Duke of Orleans, the Marquis de Meneville, and the English ambassador Sir John Acet, by their respective ladies, who are assisted, unconsciously, by the blunders of a Colonel O'Dillon, an Irish officer in the French service, pleasantly acted by Mr. Power, to whose pen this amusing composition is attributed. Abbot, Bartley, and Warde, as the gallants, and Mrs. Chatterley, Miss Forde, and Miss Taylor, as the wives, were equally successful. Miss Taylor carried the audience by storm, and was encored in two very pretty ballads (by Barnett), which she gave with the distinctness, archness, and feeling, that render her vocal efforts so remarkably effective. The piece was given out for repetition by Mr. Bartley amidst universal plaudits. Apropos of the dresses, which we have seen criticised in the newspapers as absurd. We may, on the contrary,

remark it is a proof of the attention to costume which is always so observable at this theatre, that a portrait of the Duke of Orleans in existence represents that personage in a dress precisely similar to the singular one worn by Mr. Abbot: the others were also in the true style of the day; and the ladies looked like Charles the Second's beauties reanimated. The effect altogether was very picturesque.

The *Romance of a Day*, from the prolific and ever-popular pen of Mr. Planché, was produced at this theatre on Thursday; and, having been received with all due enthusiasm, is, to the satisfaction of the author, and the gratification of the audience, to be repeated this evening. A romantic count having formed the determination to "settle down for life" with a pastoral petticoat, and, for the purpose of selection, having rang the changes upon all the village belles, arrives at the sober resolve of putting up with his lady cousin. An opportunity is here afforded for some humorous display of the sex's sincere attachment to a coronet, and of this the author has amusingly availed himself. Keeley, as a lover, is altogether irresistible; and his misery, upon finding out that his affections are misplaced and his hopes blighted, renders the scene one of the happiest we ever witnessed. Miss Taylor has but little, too little, to do; but her acting reminds us forcibly of Madame Vestris. On the *début* of this lady, we prophesied that she would rise to the head of her profession, and she is now rapidly doing so, in spite of a rather unfavourable opinion impressed upon the town by some of its critical guides, upon merely witnessing her *début* in a character so melo-dramatic as to afford no criterion for an estimate of her talents. As *Paul Richter*, she sings a song, "Karoline," with exquisite tact and sweetness. A chorus gave the fullest effect to "My fatherland," in the peculiar style of the Tyrolese, and was demanded thrice. The whole operatic strength, with the exception of Miss Inverarity, is brought forward; and we do not doubt but that the *Romance of a Day* will be prolonged to that of a season. Wilson was suffering from a cold, which detracted from his powers; but he acted admirably. The music altogether is worthy of Bishop.

OLYMPIC THEATRE.

OUR readers may remember noticing a case in the police reports sometime back, of a young man being taken into custody on the charge of having stolen a watch, advertised as lost, and the fact turning out that it was his own watch, which having been subsequently found, he had offered to pawn, forgetful of the bills issued by his own order, and distributed amongst the pawnbrokers. This whimsical occurrence Mr. Charles Dance has turned to most pleasant account, in a one-act farce, produced on Monday last at this thriving little theatre, under the title of *Misapprehension*. It is in the style of our old favourite "John Street, Adelphi;" full of smart things and droll situations; and was exceedingly well acted by Mrs. Raymond, Mr. Cooper, Mr. Vining, Miss Pincot, and Miss Stuart. The winding up of the piece is particularly novel and happy, and deserved the double round of applause it received, on the double ground of being capitally written and admirably spoken.

QUEEN'S THEATRE.

WE visited the "private view," if we may so call it, of this theatre, on Tuesday. Mr. Macfarren has used every possible preparatory device and decoration to render this little theatre

attractive since its re-christening. After relinquishing the plebeian designation of "the Tottenham," we trust it will participate in the popularity of its namesake.

FRENCH THEATRES.

THE fecundity of the French theatres is extraordinary. The *Revue Encyclopédique* states, that in the course of the year 1830, there were brought out in the various theatres of Paris (not including the Italian Opera, the German Opera, M. Comte's, and other minor theatres), 169 new pieces; viz. 7 tragedies, 13 dramas, 31 comedies, 16 operas, 28 melo-dramas, 72 vaudevilles, and 2 pantomimes. They were thus distributed:—At the Académie Royale de Musique, 3, (2 operas and 1 ballet); at the Théâtre-Français, 12, (4 tragedies, 6 dramas, 2 comedies); at the Opéra-Comique, 9 (operas); at the Odéon, 24, (3 tragedies, 6 dramas, 14 comedies, and 1 vaudeville); at the Gymnase, 10, (9 vaudevilles and 1 drama); at the Vaudeville, 21, (20 vaudevilles and 1 *parodie sans couplets*); at the Variétés, 24 (vaudevilles); at the Nouveautés, 16, (9 vaudevilles, 5 operas, 1 comedy, and 1 pantomime); at the Gaité, 14, (5 melo-dramas, 5 comedies, and 4 vaudevilles); at the Ambigu-Comique, 18, (10 melo-dramas, 5 comedies, and 3 vaudevilles); at the Porte-Saint-Martin, 9, (4 melo-dramas, 4 comedies, and 1 vaudeville); and at the Cirque-Olympique, 9 (melo-dramas). 114 authors, and 9 composers, among them furnished this mass of works. The most fertile of the authors were, as usual, Messrs. Scribe and Meleville, who produced, the one 13 pieces, the other 11. The most successful of these dramatic compositions were—Hernani, by M. Victor Hugo; Stockholm et Fontainebleau, by M. Alexandre Dumas; Fra Diavolo, by Messrs. Scribe and Auber; La Mère et la Fille, by Messrs. Mazères and Empis; Philippe, by M. Scribe; Le Couvent de Tonington, by M. Victor Ducange; and Napoleon at Schœnbrunn and Saint-Hélène, by Messrs. Dupeuty and Regnier.

LITERARY, OR RATHER THEATRICAL, CHIT-CHAT.

THE cause of Westmacott v. Kemble is set down for the 10th instant, to come on in the Court of King's Bench.—The appeal in the great Covent Garden cause, Harris v. Kemble and others, is expected to be heard in the House of Lords on the 18th instant.—Colman is far advanced in the third volume of his *Random Records*; and the father and founder of broad modern comedy, Frederick Reynolds (whose original play of the *Dramatist* so long preceded those of Morton, Colman, &c.), is about to publish a dramatic work on an entirely novel plan. It will be embellished with numerous highly finished wood-cut engravings, and the story is partly founded, we understand, on the eventful life of that great play-wright and orator, R. B. Sheridan.

VARIETIES.

Important Researches on the Grasses.—M. Raspail, an industrious observer, has been effecting, by his physiological researches, considerable improvements in our knowledge of grasses. The *festuca elatior* is only another form for the *lolium perenne*; and the *festuca loliacea* appears to be the passage by which this metamorphosis is effected. The distinctions of the species of *lolium* are only founded upon incomplete observations; and if we wished to

maintain such species as *lolium tenue*, *multiflorum*, *ramosum*, &c., it would not be more absurd to create a hundred other species. The *lolium temulentum* is only a new modification of the same type.

Ornithology.—From the letter of an esteemed correspondent, announcing a work on the ornithology of the great Himala range of mountains, the north-eastern boundary of our Indian empire—we learn that its principal features will be the brilliancy of plumage in the gallinaceous tribes, the power and size of the accipitres, and the almost infinite variety of the picae. "Amongst the former," he adds, "will be found several pheasants of a very extraordinary kind; and amongst the picae, several new jays of great beauty. The eagles are remarkable for their strength and size; in Heber's Journal an account is given of one which measured thirteen feet between the tips of the wings; and the talons of the bird were eight inches long. We have seen a cock bustard from the Himala, which, when erect, stood five feet one in his stockings."

The Death of Richelieu.—"He died like the hero of the Stoics, though clad in the trappings of a prince of the church. Most of those present were edited by his firmness; but one bishop, calling to mind the life, the arrogance, and the crimes of the minister, observed, that 'the confidence of the dying Richelieu filled him with terror.'"—*Crowe's History of France.*

Travellers' Tastes.—"It is singular how tradition, which is sometimes a sure guide to truth, is, in other cases, prone to mislead us. In the celebrated field of battle at Killiecrankie, the traveller is struck with one of those rugged pillars of rough stone, which indicate the scenes of ancient conflict. A friend of the author, well acquainted with the circumstances of the battle, was standing near this large stone, and looking on the scene around, when a Highland shepherd hurried down from the hill to offer his services as cicero, and proceeded to inform him, that Dundee was slain at that stone, which was raised to his memory. 'Fie, Donald,' answered my friend, 'how can you tell such a story to a stranger? I am sure you know well enough that Dundee was killed at a considerable distance from this place, near the house of Fascal, and that this stone was here long before the battle, in 1688.' 'Oich! oich!' said Donald, no way abashed, 'and your honour's in the right, and I see you ken a' about it. And he wasna killed on the spot neither, but lived till the next morning; but a' the Saxon gentlemen like best to hear he was killed at the great stane.'"—*Note to the Abbot.*

Latest Statistical Account of Prussia.—The new edition of Dr. Voigtel's *Versuch einer Statistik des Preussischen Staats*, composed from the most authentic documents, both printed and unprinted, with the co-operation of a great officer of state, is held up in the foreign journals, especially the *Leipzig Literatur Zeitung*, as a work of the highest merit, indispensable to every German writer on statistical subjects. By an excellent plan and logical method, the professor has been enabled to compress in one octavo volume an abundance of the most interesting state subjects. A few extracts may not prove unacceptable under the present aspect of foreign affairs. The area of the Prussian dominions Professor Voigtel states to be 5040.⁷³ German square miles, exclusively of Neufchatel and Valengin with 14 square miles.

The whole of the population, without Neufchatel, amounts to 12,726,110, of which, according to the difference of religion, 7,732,664 are of the Lutheran and reformed church, 4,816,813 Catholics, 15,655 Mennonites, and 160,978 Jews. Of the nine great cities, Berlin is rated to contain 236,830 inhabitants. The whole stock of cattle amounted in 1828 to 4,377,959 cows and oxen, 12,611,537 sheep, 198,740 goats, 1,667,219 pigs, &c. Of tobacco there were worked up in the year 1827, 269,239 hundred weight (*centner*), part of which (173,045 cwt.) consisted in leaves of home cultivation. The number of paper-mills, though by no means sufficient for the inland consumption, was, in 1827, 392. The *états*, or expenses of the six universities, in the year 1829 were—for Berlin, 87,692 thaler* (without calculating 36,934 thaler for the scientific institutions of that capital); Bonn, 98,876; Breslau, 70,144; Halle, 68,598; Königsberg 60,095; and for Greifswalde 55,486. Of learned or classical schools there are in East Prussia 8, in West Prussia 6, in the province of Brandenburg 18, in Pomerania 6, in Silesia 21, in Posen 3, in Prussian Saxony 22, in Westphalia 19, in Jülich-Cleve-Berg 12, and on the Lower Rhine 17. The chapters on the finances and the army belong to the most important. The expenditure of the state in 1829 amounted to 50,796,000 thaler, of which 22,165,000 were alone applied to the *militärverwaltung* (administration of the army). The army is divided—1. into the *heer*, or standing army of the line, with 122,000 men; 2. the *landwehr*, with 228,000 men; and, 3. the *landsturm*, with 180,000 men; making altogether 530,000 warriors. What is said on the relation of Prussia to the other European states, will also not fail to engage the reader's attention. The works and papers from which the author derived his information are all specified; but the principal value of the book is justly placed on the official documents furnished him by officers of state.

Fossil Plants.—Mr. Witham has demonstrated, by his ingenious plan of cutting transverse sections of fossil plants, that M. A. Brogniart is deceived when he imagines that there are only vascular cryptogamic plants in the coal formation.

Rapidity of Rivers.—By a number of experiments made on the Neva, it appears that the action of the wind on the surface of a great mass of running water, besides the waves on the top, which become insensible at a small depth, produces a much greater change than had been supposed in the rapidity of the subcurrents.

English Botanists abroad.—It is pleasing to hear our countrymen spoken well of abroad. A modern scientific traveller affords the following specimen. Among cryptogamists, the first question asked of me usually was, "Est-ce que vous connaissez Monsieur Greville à Edimbourg?" for this exceedingly accurate botanist stands deservedly at the head of his department. We spoke of Dr. Hooker. "Oui, je le connais bien, mais je ne l'ai jamais vu;" and Hornemann pointed out to me upon his shelves Hooker's *Flora Scotica*, his *Exotic Flora*, and *Jungermannia*; and with these Delwyn's *Conferve*, and Sir J. E. Smith's works. Then, as we went along the garden, he was careful to point out to me a red patentilla from Nipal (*Patentilla formosa*), which he received from Glasgow. "M. Greville," said Hornemann, "vous l'avez vu—il est homme grand, n'est-ce pas?" "Yes, he is above the middle size."

* The Prussian thaler (dollar) is within a trifle of three shillings in English money.

"Ah! je l'ai figuré à moi-même—un homme très grand." "How? so? Is it that you thought him a great botanist?" "Peut-être: il est grand botaniste sans doute, surtout dans les cryptogamiques; dans les cryptogamiques il est à-peu-près parfait." "And Dr. Hooker?" "Je l'imagine être petit." "But he is a tall man." "Ah! le voilà comment on se trompe de ceux qu'ils n'ont jamais vu!" "And how came you to suppose Dr. Hooker a little man?" "Je ne sais pas." "But he is an eminent botanist." "Ah, oui, oui, il est un de vos meilleurs botanistes; mais il ne faut pas être homme grand pour devenir grand homme." "Still, don't you think the chances are in favour of a little man; for the same amount of genius will be more concentrated when it has less space to be diffused over; and don't you see that most clever men are little?" "Oui, oui, c'est une bonne idée; et quel malheur ne serait-il pas pour nous trois, s'il était nécessaire d'être homme grand pour avoir de génie!"

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. VI. Feb. 5.]

Mr. Carne, so advantageously known to the public as an author, has nearly ready, the Lives of celebrated Missionaries; likely, we believe, to form a portion (and a very fitting portion) of the Family Library.—Oxford, a Poem, with Notes, by R. Montgomery. Twelve Illustrations of the same by Skelton.

LIST OF NEW BOOKS.

Lardner's Cabinet Library, Vol. II. (Life and Reign of George IV., Vol. I.), fcp. 5s. bds.—Lardner's Cabinet Cyclopædia, Vol. XV. (Crowe's History of France, Vol. II.), fcp. 6s. bds.—Bishop Van Mildert's Sermons, 2 vols. 8vo. 24s. bds.—Hughes's Divines, Vol. IX., 8vo. 7s. 6d. bds.—Valpy's Family Classical Library, No. XIV., 18mo. 4s. 6d. bds.—Manning's Stories from the History of Italy, 12mo. 7s. 6d. hf.-bd.—National Library, No. VI. Wednesday 2	23. — 35.	

Wind variable, S.W. prevailing.

Except the 28th and 30th, generally cloudy; the average depth of the fall of snow during the night of the 31st ult. and the 1st inst. is 8 inches. Snow and rain fell during the 2d till about 5 P.M., when it became clear, and again froze very sharply, the thermometer having fallen during the night to 10°, being 22° below the freezing point. The rapid thaw which is now (Thursday, 4 P.M.) going on, together with the accompanying rain, will, it is feared, be the cause of very great floods.

Rain fallen, 8 of an inch.

CHARLES H. ADAMS.

Latitude..... 51° 37' 32" N.
Longitude.... 0 3 51 W. of Greenwich.

TO CORRESPONDENTS.

The Reviews of several Medical Works, some time intended for insertion, shall appear next week.

It will be observed by our readers that, in the *sever* of politics, very few Literary Works of standard value have, as yet, been published this season. We have paid due attention to those which have issued from the press; and the lack of more has enabled us (as in this No.) to devote a larger space to other departments of our miscellany.

We got the anecdote of Professor Ross's death from a scientific publication. Our correspondent on this subject inquires if there was any disease of the stomach (which we cannot tell), and adds, that the large speckled garden spider (*Aranea diadema*, Lin.) is given successfully in cases of ague.

G. J. R. will find a note at our Office.

* It is necessary that it should be understood, that the three personages here alluded to are Professor Zelre, Professor Hornemann, and the "scientific traveller," a very nice little man, with an ample forehead, partly shaded by hair which naturally arranges itself in straight parallel lines. His features are slim, with the hectic flush of study and domestic care; but their beauty is enhanced by a constant smile, like a ripe plum ready to burst.

* One German mile makes about 4.6 English miles, since 15 of the former and 69 of the latter are reckoned to an equatorial degree; so that rather more than 21 English square miles are equal to 1 German square mile.

A UNIVERSAL FRENCH GRAMMAR;
being an accurate System of French Accidence and Syntax.
By NICHOLAS HAMEL.
A new edition, 4s. bound.

Grammatical Exercises upon the French Language compared with the English. By N. Hamel. 4s. bound.
A Key to Hamel's French Exercises. 3s. bound.

The World in Miniature; containing an Account of the different Countries in the World, with References to the essential Rules of the French Language prefixed. By N. Hamel. A new edition, 4s. 6d.

A Key to Chambaud's French Exercises. By E. J. Volsin. 18mo. 4s. bound.

An Explanatory Pronouncing Dictionary of the French Language, in French and English; wherein the exact Sound and Articulation of every Syllable are distinctly marked. By F. Abbe Tardif. 8s. bound.
Printed for Longman, Rees, Orme, Brown, and Green; and Whittaker, Treacher, and Co. London.

In 8vo. with Two Engravings, 3s. 6d.
THE EDINBURGH JOURNAL OF NATURAL AND GEOGRAPHICAL SCIENCE. New Series, No. II. for February, contains

I. Original Articles—1. On the Occurrence of the Scales of Vertebrate Animals in the Bones and Sandstone of Fifehire, by the Rev. Dr. Fleming. 2. Observations on the early Departure of some Species of Myiidae, or Warblers, during the late Summer; by P. J. Selby, F.R.S.E. 3. Lectures on the History of the Natural Sciences, by Baron Cuvier—4. Description of *Crotaphaga bicolor*, a new Species among the Mammalia, from Southern Africa; by Sir William Jardine, Bart. F.R.S.
II. Geographical, Zoological, Botanical, and Geological Collections, Notices and Analyses of New Books, Proceedings of Scientific Institutions, Miscellaneous Intelligence, &c.
Whittaker, Treacher, and Co. London; and J. Anderson, Edinburgh.

Dr. Lardner's Cabinet Library.
In small 8vo. price 5s. the First Vol. of the
LIFE AND REIGN OF GEORGE IV.
In 3 vols.
Being Vol. II. of Dr. Lardner's Cabinet Library.

The Volume already published is—
Military Memoirs of Field Marshal the Duke of Wellington,
In 5 vols. Vol. I. By Captain Moyle Sherer.

To be published,
March 1. Annual Retrospect of Public Affairs in 1830. 1 vol.

In 1 vol. 8vo. pp. 487, with numerous Figures, price 15s. boards.
A SYSTEM OF PHRENOLOGY.

By GEORGE COMBE.
Third edition.

Phrenology treats of the elements of moral and intellectual philosophy, and of the influence of the brain on the mental powers—a point of much importance, but hitherto greatly neglected. Its principles were discovered in 1787, and announced by Dr. Gall in 1790. In the introduction to the present work, the harmony of its principles with acknowledged truth is discussed, with a view to obviate the prejudices of those who, erroneously regarding it as at variance with established science, hesitate to inquire into its merits. The work has been written with constant reference and application to the moral and intellectual interests and duties of man, to the affairs of life, to the development of mind and working of individual and national character. It is illustrated by numerous figures of the heads of remarkable individuals, and of skulls from different nations. It is intended to serve, at once, as a system of phrenology, and as a manual of practical philosophy.

The first edition was reprinted in America; the second edition, consisting of a thousand copies, has been sold in face of the general opposition of the periodical press, headed by the *Edinburgh Review*; and the present edition is offered in compliance with public demand. The regular and progressive sale of the former editions affords evidence that the subject possesses attractions for nothing but its inherent interest could have supported it against the opposition which it has encountered.

QUARTERLY MINING REVIEW.

The Fourth Number, completing the First Volume of this interesting Work, is now published, with a Supplement, containing the latest Intelligence from the Mining Districts, and Index to the Volume. With a Plate, illustrative of the Paper on the Electro-Magnetic Properties of Metallic Vases, by R. W. Fox, Esq.
T. and T. Boney, 4, Broad Street, City; and Simpkin and Marshall, Stationers' Court, Paternoster Row.

With Plates and Woodcuts, 8vo. 6s. 6d.
JOURNAL OF THE ROYAL INSTITUTION. No. II.

Electricity	
Gaussen	

These in the course of publication, but not yet complete, are, Chemistry, Vegetable Physiology, Study of Mathematics, Outline of General History, Astronomy, a History of Rome, and a History of the Church.

The Society have also begun a Series of Treatises on the various Subjects of Rural and Domestic Economy, entitled "The Farmer's Series." Of these, Thirteen are published, Eleven of which are "The Horses," and Two Descriptions of Select Farms. The History and Management of the Horse will be completed in Two or Three more numbers, and, it is hoped, will comprise all the information which can be required by the private Gentleman or the Farmer.

A REFUTATION OF MR. PALGRAVE'S REMARKS ON THE "OBSERVATIONS ON THE STATE OF HISTORICAL LITERATURE," together with additional Facts relative to the Record Commission and the Record Office.

By NICHOLAS HARRIS NICOLAS, Esq.

2. Observations on the present State of Historical Literature, on the Society of Antiquaries, and other Institutions for its Advancement in England; with Remarks on Record Office, and on the Proceedings of the Record Commission. Addressed to the Secretary of State for the Home Department. By Nicholas Harris Nicolas, Esq. 8vo. price 7s. 6d.

3. The Privy Purse Expenses of Elizabeth of York, and the Wardrobe Accounts of Edward the Fourth. London, 1821.

The Privy Purse Expenses of Elizabeth, the Consort of Henry the Seventh, in the last year of her life, contain notices of the sum paid for her travelling expenses, her clothes, for the furniture of her palaces, for her jewels, for the support of her staff and ministers, for her losses at cards, dice, and other games, for the attendance of her physicians, for the wages of priests, for grants to persons who brought presents, for her religious duties, and for the support of her sisters and their children, &c. many of which throw much light upon her personal character.

The Wardrobe Accounts of Edward the Fourth are chiefly valuable for elucidating the manners, dresses, and furniture of our monarchs in the fifteenth century, more particularly in relation to the Court, and to the personal habits; and for the composition of historical pictures, and for the stage.

The Memoirs of Elizabeth of York and of her sisters, and the heraldic remarks which are prefixed to the volume, present are facts, and it is presumed, correct many important errors in the history of the Proceedings of the Fourth, Richard the Third, and Henry the Fourth.—*Price 7s. 6d.*

William Pickering, Chancery Lane, London.

Hornsey's Elementary Works.

THE BOOK OF MONOSYLLABLES; or, an Introduction to the Child's Monitor, adapted to the Capacities of Young Children.

Messrs. Underwood, Fleet Street, London; and Messrs. Bacon and Kinnebrook, Norwich.

Maps.

Under the Superintendence of the Society for the Diffusion of Useful Knowledge.

THE unparalleled success which has attended this publication proves that the Society was well aware of the wants and wishes of the Public. This Series of Maps, which will leave nothing to be desired in a Geographical Atlas, either by Families or Schools, and which has no competition either for cheapness or accuracy, will comprise from Forty to Fifty Modern Maps, and as many in Ancient Geography, drawn on the same scale, as are requisite to exhibit the portion of the world known to the Ancients. It will also contain Plans of the most interesting Cities. The Maps are in size about 14 inches by 12; and each Number, containing Two Maps, is sold for 1s. or with the Outlines coloured, 1s. 6d. The Ten Numbers already published contain Two Maps of Greece, Two of Turkey, and Two of Italy, all both Ancient and Modern; Three of England; Two of France, and One of the Netherlands; also a Plan of Ancient Rome and of the Modern City.

No. XI. will contain Egypt, Ancient and Modern.

London: Baldwin and Cradock.

By whom also are recently published, under the

Superintendence of the same Society,

Six Maps of the Stars; laid down according to the Geographic Projection, including all the Stars to the Sixth Magnitude, or such as can be seen with the naked eye.

These Maps of the Stars are printed upon paper of the same size as the Geographical Maps, price 1s.

For the Use of Families and Schools.

Price 5s. 6d. neatly bound.

A FAMILIAR ANALYSIS OF THE CALENDAR OF THE CHURCH OF ENGLAND, and Perpetual Guide to the Almanac, in the Form of Question and Answer; illustrated with a Variety of Anecdotes, and Descriptive Sketches of the Origin of Popular Customs at particular Periods of the Year, and authenticated by References to Scriptural and other Authorities.

By the Rev. HUGH F. MARTYNDALE, A.M.

London: Printed for Edinham Wilson, Royal Exchange.

Mr. Gratton's New Work.

Second and third editions, in 2 vols. post 8vo.

THE HEIRESS OF BRUGES. A Tale.

Author of "Highways and Byways," "Tales of Travel," &c.

"The Heiress of Bruges" cannot fail to extend, in an eminent degree, the reputation of its popular author; nor do we hesitate in recommending the work to the perusal of those who do not commonly indulge in this species of light reading. The tale, like that of "Juventine Edward," conveys much valuable information concerning one of the most interesting epochs of history. The general style is manly, animated, and characteristic, and calculated to attract the attention of the literary readers of the continent, where the author has been long reading, as well as those of his native land.

Henry Colburn and Richard Bentley, New Burlington Street.

Mr. Theodore Hook's New Work.—In 3 vols. post 8vo.

M A X W E L L.

By the Author of "Sayings and Doings."

"One of the writers whose reputation will exist, and even increase in celebrity, is the author of 'Maxwell.' He has inimitable talent at working out the humorous and whimsicalities of character. His portraits are marked by life, truth, and originality. There is not a single name in the book which might have been talked, and which it would not have been amusing to hear. The truth is, that the author is a man who can talk himself, and whose ideas habitually have him in a form to amuse and strike."—*Spectator.*

Henry Colburn and Richard Bentley, New Burlington Street.

In demy 8vo. cloth, price 5s.

THE SIEGE OF CONSTANTINOPLE;

a Poem, in the Canton.

By NICHOLAS MICHELL.

Smith, Elder, and Co. Cornhill.

In a very thick and closely printed volume, 4to. price only 21s.

A COMPLETE CONCORDANCE TO THE HOLY SCRIPTURES OF THE OLD AND NEW TESTAMENT; or, a Dictionary or Alphabetical Index to the Bible, in Two Parts: containing—1. The Appellative or Common Words, in so full and large a manner that any Verse may be readily found by seeking for any material Word in it. In this Part the various Significations of the principal Words are given by which the true Meaning of many Passages of Scripture is shown: an Account of several Jewish Customs and Ceremonies is also added, serving to illustrate many parts of Scripture.—II. The Proper Names in the Scriptures: to this Part is prefixed a Table, containing the Significations of the Words in the Original Languages from which they are derived. To which is added, a Concordance to the Apocrypha. The whole digested in an easy and regular method, and constituting the most useful Book of the kind ever published.

By ALEXANDER CRUDEN, M.A.

A new edition carefully revised and stereotyped; with a Life of the Author.

By ALEXANDER CHALMERS, F.R.S.

POEMS.—The Sisters, a Scottish Legend; Mary, a Tale of the Highlands, &c.

By M. A. ROBERTS.

William Pickering, Publisher, Chancery Lane.

Just published, Vols. 1, 2, 3, and 4.

ILLUMINATED ORNAMENTS, selected from Missals and Manuscripts of the Middle Ages.

By HENRY SHAW, Esq.

To be completed in Twelve monthly Parts, each containing Five Plates, medium 4to.

Carefully coloured from the Originals, 7s. 6d. each Part.

Plain 3s. 6d. ditto.

A very limited number will be printed on imperial 4to. and the Ornaments more highly finished in opaque Colours, heightened with Gold, price 15s. each Part.

"The variety and beauty of those ornaments," it is observed in the Prospectus of this splendid little work, "which decorate the Illuminated Missals of the Middle Ages, are so duly appreciated by all acquainted with them, that it is somewhat surprising no publication has yet appeared, which by a judicious selection and careful imitation of them, might make their excellence more generally known." The talents and taste displayed by Mr. Shaw in his "History and Antiquities of the Chapel at Luton Park," are a sufficient assurance of the ability with which his present undertaking will be executed. It is to be completed in twelve parts, of which that under our immediate notice presents an admirable example."—*Literary Gazette.*

William Pickering, Chancery Lane, London.

Vols. III. and IV. price 15s. each Vol.

BOJARDO ed ARIOSTO, ORLANDO INAMORATO e FURIOSO, with Notes and Illustrations in English.

By ANTONIO PANIZZI.

"To the general reader these pages present much attraction; the analysis of the stories is amusing, the criticisms are excellent, and enlivened by much of shrewd observation and witty remark; but to the Italian student the disquisition is valuable, as the library, where Ariosto, Tasso, &c. are favourites, should be without this, their fitting companion."—*Literary Gazette.*

"It is a work of a highly cultivated mind, replete with liberal and enlightened views, and evincing originality and talent not commonly combined with so much patience of research."—*Athenaeum.*

William Pickering, 57, Chancery Lane.

New edition, in 1 vol. 4to. price 3s. 3d.

REVIEW OF NEW BOOKS.

TRELAWNY'S JOURNAL.

IN the absence of any work of leading interest this week, we give the first place to an Extract from an unpublished Journal, which bears strongly (we would say too strongly) on a topic of great attraction to the literary world. It has been called forth by our review of Mr. Millingen's volume, and is contained in a communication from Mr. Trelawny, at Florence. But, though the nature of the questions at issue, and a sense of justice towards all parties concerned, induces us to print this document, we beg it to be distinctly understood that we are far from subscribing to the writer's violent opinions: we have, on the contrary, marked with asterisks several passages, among others, imputing misconduct to sects and individuals, from which we utterly dissent: and we have struck out epithets which we would not ourselves sanction or apply to the worst of human beings.

EVEN the Quakers, steel-hardened as they are to human suffering, (out of the pale of their own tribe,) detesting villanous salt-petre, and interdicted from aiding and abetting war, could not resist the epidemic which spread like fire throughout Europe in favour of the Greeks. The expiring embers of the days of chivalry appeared rekindled; yet it proved but a bonfire of brushwood, ignited by stock-jobbers, loan-mongers, and contractors; for a moment it blazed, and was extinguished for ever. Still, for that moment, it warmed all hearts, and its intensity may be judged of by the fact of its having moved the gelid hearts and stolid viages of Quakers.* They came forth with a contribution of a thousand pounds to succour a nation of Helots, threatened with extermination, and struggling against measureless odds for existence. Somewhat late, they remembered it was against their narrow and impossible creed to aid and abet, in any shape, either in purse or person, war; and the wise men and elders gathered together to determine how they could extricate themselves from the dilemma into which the younglings of their flock had plunged them. That their feelings, like a hot horse, had run away with their judgments, was an unprecedented instance. Their natural sagacity, however, did not abandon them: they hit on an expedient, by which they served the Greeks in the manner of Macbeth's juggling vishes.

"That keep the word of promise to our ear,
And break it to our hope."

Instead of sending the Greeks the money, or the munitions of war, they assisted in their extermination by sending them nothing but drugs and surgical instruments, and those were stolen without judgment. The Greeks never submit to amputation or salivation; so scalp, saw, tourniquet, and calomel, were presented to them; but not a grain of bark, the only drug a Greek will swallow willingly. The English committee, at their expense, added two surgeons. The one I am to speak of was a handsome, delicate, and unpractised boy, of the name of Millingen. He joined Lord Byron at Cefalonia, during my absence in Greece, and accompanied him to Mesolonghi.

On my arrival at that place from Romily, immediately after the noble poet had yielded up his mortality, in the year 1824, I was ac-

quainted by a Mr. Hodges, an Englishman likewise in the service of the committee, that Dr. Millingen was suddenly and dangerously ill of a fever, always rife in that accursed city of stagnant waters, green mud, and malaria. That Mavrocordato and the Mesolonghiot primates should have done their utmost to detain Lord Byron and his chest of dollars amongst them, was not to be marvelled at: besides, his name was powerful as the mountain of load-stones mentioned in the Arabian tales, drawing all that approached it to their destruction; for, though they were lost, their dollars remained, which was all the Greeks wanted. So exclusively had Mavrocordato appropriated, in imagination, to his own use Byron's dollars, that, not content with constituting himself heir, he had extracted a considerable sum from him while living. Lord Byron had, at Ithaca, undertaken to maintain a family of exiles from Patras. The eldest son he took to Mesolonghi, and made him his chibookgee; when, partly for himself, but chiefly as a provision for his family, he made over to him, on several occasions, between three and four thousand dollars. Mavrocordato was commissioned to send a portion of the money to the family, then residing at Cefalonia, and the remainder he undertook to place in the hands of Lord Byron's agent at Zante, Samuel Barff, Esq. for safe custody. I have only to add, that Mavrocordato retained the entire sum for his own use. The family was left in utter destitution at Byron's death; and the young man died six months after, in want of the necessaries of life. So much for "honest, honest Iago."† I was indignant at the doctors; they must be, I thought, as besotted as ignorance made drunk, to be cajoled by Mavrocordato, which they were, into a belief that any animal but a toad could escape the contagious fever with which all the inhabitants were more or less affected, which no stranger had been ever known to escape, and which few survived. The hordes of barbarians that besieged it from without; reaping with their swords an annual harvest of human heads, were not more destructive than the annual pestilence which raged within.‡ My letters to Byron, urging him to come to Athens, or, at least, to quit Mesolonghi, were, of course, intercepted; but so anxious was I to induce him to leave a place fatal to strangers, that I persuaded two Englishmen, at different periods, to take letters to him, reiterating my entreaties that he would remove into a purer air. I knew the extreme difficulty of moving him, so great was his apathy and indolence. He confessed this to me by once saying,—"I so dislike changing my abode, that if we were driven on the island of St. Helena, with Sir Hudson Lowe, I should

† When I last visited Mesolonghi, in 1827, this devoted city had been destroyed. Groups of Albanians and Arnauts sat smoking their pipes on its ruins, and the Bulgarians had stalled their horses in the halls of its primates' palaces. Lord Byron's house, in which he had lived and died, stood alone erect and unscathed. The Turkish guard at its portal marked it as the abode of the pasha. By some strange chance it had escaped the general ruin, and loomed like a lonely column in the midst of a desert.

stay there; for I cannot make up my mind to move under six calendar months." Mavrocordato himself, Millingen, and, with the exception of Mr. Hodges, every foreigner, was suffering from the fever. Mr. Parry, of the committee, with most of the Europeans, had withdrawn to Zante ill; and all the other philhelenes in the service of the Greeks, solicited Colonel Stanhope and myself to remove them from a place which had been the grave of so many of their comrades. I cursed Millingen and Bruno, as the two men, professing the art of medicine, in attendance on Lord Byron, their victim,* for their ignorance in not having pointed out to him the certain fate which would follow his tarrying in that pestiferous atmosphere; against which, with his shattered and sensitive constitution, he could not hope to contend. When he was attacked, the result proved how totally inadequate was their knowledge; and he, as may be gathered from his last words, discovered, when too late, that he had fallen into the hands of boyish charlatans. "If I get better," he exclaimed, "I'll leave this place. I'll go to the Ionian Islands; for these doctors don't know my complaint." Bruno and Millingen, who were then in the room, he ordered abruptly to leave it; and on the doctors remonstrating at quitting him in such a state, he said in passion,—"I order you fellows to leave me! What! is it come to this? Can I not change my shirt without a set of black-guard doctors in the room?"—glancing fiercely at Bruno and Millingen, who slunk off. He then said to Fletcher, his valet,—"These doctors know nothing of my complaint. I want to know what is my disease. I know these fellows know nothing about the matter."† In fact, he did send to Zante for Dr. Thomas. I say these reflections made me curse Millingen; yet my feelings of humanity impelled me to visit him. I accompanied Mr. Hodges to his lodgings. We found him in bed, suffering under an attack of the malaria fever. He had been described to me as a tall, delicately-complexioned, rosy-cheeked, dandy boy, of simpering and affected manners, such as Captain Whiffle's surgeon, Simper, is described in *Roderick Random*. Mavrocordato, too, in my presence, had spoken of him as "*mio caro ragazzino, Millingen*;" which let me into the secret of how he had cajoled him. When I saw the doctor on his sick couch, he fulfilled the idea I had entertained of him. He seemed under twenty years of age; Bruno, also, the Genoese doctor, whom we brought from Italy, was a student under twenty. When I remonstrated with Byron against engaging an unpractised boy, his answer was,—"If he knows little, I pay little. I have got the fellow for twenty pounds a-year;—is it not a good bargain?" Millingen whined and cried like a sick girl; talked of his mother, who had taken the veil, and was shut up in some Italian convent; declared

† This is an extract from an account, gathered from his household, of the death of Lord Byron, written on his coffin by me, at the house of the primat Apostoli Areotoli, in which he died, Mesolonghi, April 29, 1824.

he could not survive the night; thanked me for visiting him; asked Hodges to sit up with him, as he was afraid of being left alone; expressed his dread of being robbed, for he had money in the house; and wished to make his will, and appoint his executors. Hodges, and those in charge of the committee stores, had informed me that Millingen had been in the habit of disposing of the Quakers' drugs, and that he had opened practice on his own account, not gratuitously, as he was bound to do by his engagement, besides which, Mavrocordato had consigned over to him the surgical instruments. By these means he had extracted money from the poor Greeks. I was astonished that one so young, embarked in such a cause, and being, as he believed, on his death-bed, should express such deep anxiety about a few hundred dollars; for he repeatedly solicited me, in the most earnest manner, to see that he was not robbed, and to witness his will. My experience in malaria fevers was greater than his; and to me he did not appear in immediate danger. I have remarked, that no persons are so complaining and querulous as doctors and priests when they are ill; one having as little faith in the medicine he prescribes, as the other in the doctrine he preaches.* I staid with Millingen as long as the urgency of my own multifarious duties would permit; and, pitying his condition, did all I could to serve and console him, for which he expressed the greatest gratitude—it was as short-lived as his malady. The ensuing morning I saw him, and he was better; which he mainly attributed to having followed my advice. He shortly after, I think, removed from the town, and my time was so entirely occupied that I never saw any thing more of him.

I will here briefly mention, that my first personal dissension with Mavrocordato arose from a circumstance at this period. He had made some private arrangements with Count Gamba, by which he was to be permitted to take possession of the money left by Lord Byron, amounting to six or seven thousand dollars. I protested against this injustice. Mavrocordato essayed, by every means, to persuade me to consent to it: I remained inflexible. He was too pusillanimous to be open, and threaten force; but he slyly told me, the Mesolonghiots would not permit the dollars to be taken from the town; that he had not an efficient force to control the populace, and could not be accountable for the outrages which might ensue if I attempted to embark the money. My answer was, that I had a force sufficient for the purpose, and that I would protect the property of my deceased friend. Several notes and messages passed between us, of a hostile nature. Finding myself threatened, and that Mavrocordato was secretly exasperating the town's-people against me, I sent my emissaries to concert with the Zuliots, encamped at Annatolica, about four miles from the town, in a high state of exasperation at Mavrocordato and the town's-people. Not being permitted to enter the town, these Zuliots openly threatened, if their arrears of pay were not liquidated, to enter by storm, and pay themselves. My promise with their chiefs was that, in the event of my being attacked while defending my friend's property, I would immediately, with the troops of Romiliot I commanded, force open the gates, and give entrance to the refractory Zuliots. Mavrocordato got an inkling of this business, which so thoroughly intimidated him, and spread such a panic amongst the primates, that they hastened in a body to assure me no opposition should be offered. In fact, from that time I was not molested, and had only to take precaution

against secret treachery; for Mavrocordato, I knew, had ground down the sword of justice to an assassin's dagger,* which eventually did reach both Odysseus and myself. The men with me, old Romiliot Klefti, were dreaded, and an efficient guard. Besides these, Lord Byron's brigade of artillery, knowing their paymaster was no more, and that the town's-people would not even afford them rations, volunteered in a body to enter into the service of Odysseus. I divided the brigade and took half of them, with five mountain guns and munition, for which I had the order of Colonel Stanhope, then in charge of the committee stores at Zante. For the truth of this statement I refer to Colonel Stanhope, Mr. Hodges, and Fletcher, all residing in London. Others concerned are dead; and I do not, like Dr. Millingen, cite the unsupported authority of the dead, by forging lies to suit my purpose.*

On Mavrocordato's being appointed to a situation in the government, he embarked thither with Millingen. Had they gone by land, their fate would have been different. Navarino, in its fortress and position, was considered impregnable; and Mavrocordato, with others, threw himself into that fortress, at the commencement of the campaign in 1825. Hadjee Cristi, a gallant, renegade, Bulgarian Turk, who had been taken prisoner by Nichetus, entered into the service of the Greeks. He was entrusted with the command of the fortress, with a large body of troops—three thousand; and Mavrocordato (for Hadjee was unlettered) enacted the civil duties. Millingen was with him. This fortress was taken by the Egyptian tactics, under the command of Ibrahim, nephew of Ali; for the pasha of Egypt has no son, though Ibrahim has been called his son. Hadjee made a gallant defence; for, in truth, he is a noble soldier, but more practised in charging with his wild cavalry on the field, than in defending fortresses; for which he was, indeed, as unfitted as a South Sea Islander. Mavrocordato had selected a little island, situated at the entrance of the magnificent bay of Navarino, as affording the only means of escape to the Greek shipping which was in the offing, in case the Turks should be successful on shore. The fortress was taken, and so was Hadjee and his garrison; but the wily Mavrocordato escaped, leaving his minion, Millingen, to his fate, with the rest of his trusty followers.

Ibrahim, commander-in-chief of the Egyptian tactics, introducing, for the first time, a disciplined army into Greece, evidently commenced his career by endeavouring to accompany it with other usages of what is fancifully termed civilised warfare. With the malignancy, unmitigable ferocity, and individual detestation, existing between the European Turks and the Greeks, he did not, and would not participate: he is neither a fanatic nor bloody. The French general, Suliman Bey, who had embraced Mahometism, and was allied by marriage to Ibrahim, had great influence over him: as far as I know, he used it properly. On Ibrahim's first signal advantage over the Greeks, in the capture of the important fortress of Navarino, he certainly acted with a forbearance and magnanimity which is not common even in European kingdoms most vaunting themselves in the march of civilisation. Not a musket nor bayonet was used after the cessation of hostilities, nor a drop of blood unnecessarily shed: the prisoners were neither plundered nor insulted. Ibrahim harangued the Greek leaders, and commanded them to tell the prisoners to appear individually before him, after having delivered up their arms. When before him,

he briefly questioned them, and then ordered them to deliver up what money or treasure they had secreted about their persons, signifying that if they hesitated in so doing, or attempted concealment, he should order them to be instantly executed. However, he gave them all the option of entering into his service, and retaining their property: he made no distinction unfavourable to the persons of foreigners serving the Greeks, whom the Turks had always sacrificed with cunning cruelty. Millingen and an American surgeon were of the number brought before him: in reply to their plea of being strangers and medical men, taking no part in the war, merely practising in their profession, Ibrahim said—"If that is the case, it will signify little whether you serve Greeks or Turks; and I will pay you better than the Greeks." The starchy republican indignantly refused, and, unhesitatingly throwing what money he had on the floor, withdrew; but the Englishman (if he is one, which I doubt), Millingen demurred; and the pasha, seeing he was a pretty boy, smiled on him, and made an offer to retain him in his personal service. Millingen only demurred to get the most advantageous terms, and then accepted them. Thenceforth he continued in Ibrahim's service till I left Greece, or rather the Ionian Islands, in 1828. On various occasions his countrymen remonstrated with him on his apostasy; his only and constant reply was—the Turks are better, and pay better, than the Greeks. Captain York, or Stewart, of the navy, and a lieutenant of the Cambrian, saw him at different periods, urged him to abandon the Turkish service, and proffered him the use of their ships; but the Turks gave him money, and he continued with them. Now, the Greeks love money—they love women, too; but gold is their idol—gold is dearer to them than the bright eyes of their mistresses; but out of three thousand adventurers, of all sorts and conditions, all serving for pay and plunder, one man alone was mercenary and base enough to abandon the cause in which he was engaged, and for which he received pay, even to be a deserter to the enemy,—and that was Millingen, a self-styled Englishman, a professor of a science considered the most liberal. His name, and deservedly, was never mentioned in Greece, after his treachery, without being accompanied by universal execrations. Yet this comments, criticises, and runs a-muck with his scalpel, stabbing at honourable men. Let him disprove this, or remain with the stigma of a branded liar. If he can prove a single syllable he has asserted against me, I am content to suffer the same fate. The medicines and instruments given by the Quakers, and the stores given by the English committee, excepting the portion consigned to Odysseus, all fell into the hands of the enemy Ottoman.

I have only to add, that it is probable I should not have thus troubled you, by replying to Mr. Millingen with my pen, had it been possible to reach him with my hand; but the renegade Dr. Millingen is settled at Constantinople, protected by the firman of the Porte.

Florence,
Jan. 20, 1831.

J. EDWARD TRELAWNY.

The Death-Wake, or Lunacy; a Necromant, in three Chimeras. By Thomas T. Stoddart. 12mo. pp. 144. Edinburgh, 1831, H. Constable; London, Hurst, Chance, and Co. ALL know the pretty Arabian fable of the rain-drop that fell into the ocean and there hardened into a diamond; but what a difficult

ask it would be, amid the many drops that mingle with the deep, to foretell which was destined to be the future gem! The works of poets, now-a-days, are almost as numerous as the drops in April showers; and, amid the many, we would scarce take upon ourselves to predict which bears the charmed life, hereafter to become a pearl for the crown of fame. We have seen such fair promise belie itself, and come to nought; and no less have we witnessed beginnings the most sterile yet turn to fair account. Were we, however, to lay down a rule, as tolerably correct as observation can form from experience, we should say, our best expectations are of the young poet whose imagination runs a little wild,—who has great faults, but still touches of originality and beauty. Of cold imitative correctness—the “line and level” school of poetry—we despair; but from a youthful writer, whose extravagance speaks of riches he knows not how to use, and who wants taste rather than material, of the futurity of such a one we have at least hope. Mr. Stoddart belongs to this latter class. The volume is full of faults, affectations, and absurdities, bad rhymes, and worse imagery; but all these are redeemed by touches of extreme beauty and true poetry. He has too many memories of fairy tales clinging about his verse,—the Aladdin imagery of diamonds, amethysts, silver, and gold. Again, when he wants to be terrible, he is only loathsome in his delineations, if not ludicrous. What can be said of lines like the following?

“The worm hath ‘gan to crawl upon her brow—
The living worm! and with a ripple now,
Like that upon the sea, are heard below,
The slinky swarms all ravening as they go
Amid the stagnate vitals, with a rush.”

“A yellow group
Was creeping on her bosom, like a troop
Of stars, far up amid the galaxy,
Pale, pale, as snowy showers; and two or three
Were mocking the cold finger, round and round,
With likeness of a ring; and, as they wound
About its honey girth—

We know not whether these similes are most dissimilar or most revolting. The worms are first like “a troop of stars;” then like “snowy showers.” Mr. Stoddart is very varied, and very original in similes; but he often applies them with singular impropriety: for example, where he compares “death, cradled upon beauty;” to

“A bee
Upon a flower that looketh lovingly;”

or where he says that Julio was

“Mad as the fall of leaves upon the tide
Of a great tempest, that hath fought and died
Along the forest ramparts.”

This imagery of an autumn storm is as good as its application is bad. Never was a heroine’s name so useful—it rhymes to every thing—
—Agathe, “be,”—“Agathe,” “away,”—
—Agathe, “inquiringly.” The songs introduced are some of the worst specimens. Poetry such as this is like Tarpeia, buried under ornaments—the golden bracelet becomes a weight of iron to crush her. Mr. Stoddart is the very name of song—he luxuriates in “shells of silver,” “citadels of amethyst,” “wings of diamond,” “pouring diamond,” “amber weed.” But enough of this: faults are more likely to be amended by being simply pointed out, than by being dwelt upon. We turn to the far more pleasant office of pointing out beauties. The poem opens well—

—An anthem of a sister choristry!
And like a windward murmur of the sea
O’er silver shelle, so solemnly it falls!
A dying music shrouded in deep walls,
That hush the wild breathings!

“The arcades,
Tenth after torch, into the moonlight fades;
And there is heard the music, a brief while,

Over the roofings of the imaged ale,
From the deep organ panting out its last,
Like the slow dying of an autumn leaf.”

The story is “the very wildness of romance;” it is founded on the madness of the hero, a monk who robs the grave of “the dead Agathe,” a nun whom he had loved—embarks with the body in a boat—is driven, by wind and wave, to an island, where he is buried with his mistress. Parts are fine; but, as a whole, the tale rather shocks than enlists our sympathies. There are some images of great beauty.

“A wild bird that floated far and fair
Betwixt the sun and sea:”

Sketch of the heroine:—

“A most lovely one
As ever to the warm light of the sun
Threw back her tresses,—a fair sister girl,
With a brow changing between snow and pearl,
And the blue eyes of sadness, fill’d with dew
Of tears.”

“She wept for her lost parent. It was sad
To see her infant sorrow; how she bade
The flow of her wild spirits fall away
To grief, like bright clouds in a summer day
Melting into a shower.”

The ensuing image is misapplied as a simile, but is fine in itself—“stars unseen for paleness.” Julio’s bending over the body is thus described—

“Taking a foretaste of the awful trance
That was to pass on his own countenance!”

Fanciful description of the winds:—

“The night-winds, in their lonely way—
Some whistling and some moaning, some asleep,
And dreaming dismal dreams, and sighing deep
Over their couches of green moss and flowers,
And solitary fern, and heather bowers.”

The next passage blends both the faults and merits of our young author.

“The beautiful pale wing
Of a sea-bird was worn with wandering,
And, on a sunny rock beside the shore,
It stood, the golden waters gazing o’er;
And they were heaving a brown amber flow
Of weeds, that glittered gloriously below.”

It was the sunset, and the gorgeous hall
Of heaven rose up on pillars magical
Of living silver, shafting the fair sky
Between dark time and great eternity.
They rose upon their pedestal of sun,
A line of snowy columns! and anon
Were lost in the rich tracery of cloud
That hung along, magnificently proud,
Predicting the pure star-light, that beyond
The east was armouring in diamond
About the camp of twilight, and was soon
To march under the fair champion moon,
That call’d her chariot of unearthly mist,
Toward her citadel of amethyst.”

The next are good:—

“The snowy sail
Is hoisted to the gladly gushing gale,
That bosom’d its fair canvases with a breast
Of silver.”

“Night, with her starry tiar, floateth in—
A dark and dazzling beauty, that doth draw
Over the light of love a shade of awe!”

“Famine, empty as a breeze!”

“There stood a wild and solitary grove
Of aged pines, all leafless but their brows,
Where a green group of tempest-stricken boughs
Was waving now and then, and to and fro,
And the pale moss was clustering below.”

“A faded flower! with all the vernal dews
From its bright blossom shaken, and the hues
Become as colourless as twilight air!”

“The gloomy gorge
Of waters, sounding like a Titan forge!”

We have before expressed our conviction, that poetical prophecies are half like vows “made in pain”—if not “violent,” they are at least “void.” We will simply express our present opinion of Mr. Stoddart: he has original imagery, a vein of poetical fancy and feeling, which if it were less gorgeous would be more truly rich. The old anecdote of Apelles is the best parting advice we can give him:—seeing a picture of Helen, by one of his pupils, overlaid with “barbaric pomp of pearl and gold,”—“So,” said he, with the true and good taste of

a great painter, “not being able to make her beautiful, you have made her fine.” To this we only add, that Mr. Stoddart does not appear to want power; but rather to exaggerate, in the fulness of youthful imagination.

The Incognito; or, Sins and Peccadilloes. By Don T. de Trueba, author of “Romance of History—Spain,” “the Castilian,” &c. &c. 3 vols. 12mo. London, 1831. Whittaker and Co.

THESE volumes come before the public with two great advantages—first, they take perfectly untrodden ground; as the preface justly remarks, “*The Incognito* is the first Spanish novel of its class which has appeared in England.” Secondly, Spain being the author’s native land, he must be at home in the scenes he depicts. The story is quite a romance—this will, perhaps, be a recommendation to our younger readers—and many of the scenes are written with great liveliness. We do not, however, think our author’s forte lies in “drawing from life.” His characters are rather caricatures; and he sometimes forgets that the absurd is not always the entertaining. We select, as a national picture, the evening walk on the Prado.

“The evening was peculiarly fine, and consequently the flow of people was very great. The gorgeous equipages of the grandees rattled pompously along, whilst the great salon was crowded with pedestrians of various ranks. The beautiful marble fountains which adorn the place threw the limpid water aloft, and contributed to impart to the air that refreshing influence so necessary in southern climates. The elegant madrilenas carried themselves very stately along, handling their fans most efficiently, and drilling their pretty feet in all the precision of a graceful march. On one side fell partially the costly mantilla, whilst through the fine lace that bordered the silken veil, the expressive black eyes shot those electric glances which cause such execution on the daring beholders. The taste for foreign dresses was yet comparatively unknown to the ladies of Madrid, and consequently the national costume predominated in the Prado. Indeed, in the Spanish ladies it cannot be susceptible of improvement, for the basquina and mantilla are precisely the attire necessary to set off to advantage the kind of beauty with which nature had endowed them. Amidst the ranks of beautiful females were to be seen many youngsters blazing in regimentals, and a tolerable portion of ecclesiastics and monks, all of whom tended to throw a pleasing variety over the scene. How different, too, were the various individuals that contributed to increase the number of the multitude! An experienced eye might detect the travelled Spaniard looking superciliously on some of his bigoted countrymen, whilst the old prejudiced one looked with a sort of horror on those whose favourite word of civilisation seemed synonymous with irreligion. Many an old Hidalgo of the ancient school was still to be seen creeping slowly along, with haughty yet downward looks, listening attentively to some attendant friar; and many pious beatas twaddled along, carrying the rosary in a very conspicuous manner. There were even some, who, as they moved along, did not scruple to keep their thoughts occupied in prayer, and the fingers busily employed in counting beads. A little behind a beata a young niece or daughter was seen listening to the passing whispers of admirers, who, no doubt, ejaculated prayers of a different stamp from those of the religious matron. The prospect of the Prado was beau-

tiful; a soft calm evening was gently ushering in a clear night—a night peculiarly adapted for the amorous cadences of the guitar, and the melodious and plaintive voices of lovers. Suddenly the immense concourse seemed as if by magic to have been arrested in their progress, and in their animated conversation. Every one was rooted to the ground, the men with their heads completely uncovered, holding their hats in their hands, and the women modestly a little bent forwards, some covering their faces with the abanicos (fan), and most of them with their mantillas down. The enigma was soon explained. A hundred bells, in a monotonous variety of tones, had chimed the oracion, or Ave Maria, and every individual was now really or apparently engaged in the pious occupation. Many groups had been instantaneously formed, at which some ecclesiastic, or the eldest person, presided, and said the prayer. A thousand drowsy, solemn deprecatory tones encumbered the air, with a sort of prolonged and gloomy murmurs, until the bells finished the signal. Then a prodigious quantity of 'Amen's' in various keys and tones, basso, soprano, &c., flew around, when every one unbended from the impromptu position of religious constraint, and the promenade was resumed at the salutation of buenas noches."

The turkeys entering Madrid for Christmas is a very national sketch.

"Nor is it less amusing to behold the arrival of the paveros (turkey-sellers), who conduct, in martial array, a numerous army of well-fed pavos, or turkeys, with wonderful precision and discipline. Indeed, it seems strange to see a single man armed with a single long and slender vara (rod), marshal along some hundreds of the noisy pedestrian birds, which fill the air with aqueous sounds and shrill clamours, whilst the beggarly urchins, assembled along the street to behold the noisy and magnificent entrance, augment, with their cries of joy, the din which already prevails. But the most interesting part of the ceremony is to perceive the extreme anxiety of the general when his army has entered the streets; for there the evolutions are rendered particularly difficult, on account of the coaches and other vehicles, as well as the multitudes which already encumber them. Besides, experience has repeatedly told the paveros that many an enemy is narrowly watching his movements, and ready to take advantage of a moment's negligence. Every body at Madrid makes a point of eating a pavo at this time; and every body at Madrid has not, unluckily, money to purchase the commodity. A serious inconvenience would hence result; but kind nature has judiciously provided for the difficulty, by bestowing an uncommon share of tact and wonderful proficiency in sleight-of-hand tricks on those individuals who are destitute of the legitimate means of getting possession of a pavo. Now, as the paveros know perfectly well that a mighty host of these amateurs are anxiously expecting their arrival, their care increases tenfold as they wind their way along the streets. There they see the terrible enemy deeply meditating some plan of attack. It is not difficult to read their fearful intentions, it is seen in their hungry eyes—there they lounge, at the entrance of a taverna, (public-house) wrapt in their old dingy cloaks, the dimensions of which are exceedingly favourable for their practices. Their very gestures tell how keen an appetite they have for the delicious morsel; and the unfortunate turkey-merchant perceives, with sorrow, how the traitor's eye glimmers at the prospect of the approaching capture. He re-

doubles his vigilance, but to no purpose; for by the time he arrives at the Plazuela de la Cebada, the indiscriminate encampment of these armies, and proceeds to a muster, to ascertain the number of his troops, he finds, with no little vexation, that at least two or three dozen have deserted during the march."

We would advise Don T. de Trueba to devote his attention to the new path he has chosen; we think he will do a great deal better: he is an animated writer, but he strains too much to be amusing—and let him bear in mind our own old proverb, that a man should be very wise to play the fool—very "nice distinctions," indeed, "do the bounds divide" between nonsense and persiflage. One question we would ask him—are not his Spanish "ladies and gentlemen" very English? Ver-de-for, with his quizzing glass, seems to have stepped out of Regent Street. But, perhaps, our author will tell us that human nature is human nature all the world over.

Divines of the Church of England; with a Life of each Author, a Summary of each Discourse, Notes, &c. Vols. VI., VII., VIII., IX. The Works of Dr. Isaac Barrow, Vols. I., II., III., IV. By the Rev. T. S. Hughes, B.D. 12mo. London, 1830. Valpy.

No uniform edition of the *Divines of the Church of England* has hitherto made its appearance. This deficiency has, in all cases, naturally led to a very irregular, in most to a very partial, collection of these valuable works. We fear, also, the motives for neglecting a course of reading alike incumbent and improving to the student of divinity, have, from the same cause, been additionally strengthened. Thus, from a desideratum in the library, results a vacuum in requisite information. To fill up this hiatus clerically *defendus*, by means of monthly volumes, commodious in size and economical in price, is the praiseworthy object of Mr. Valpy's edition. The execution of this undertaking fully equals the design. Each author is accompanied by a memoir, and each sermon preceded by an admirable analysis. The Rev. T. S. Hughes combines in writing the lives a fair portion of entertainment, while conveying the necessary information, and supplies a clear-sighted synopsis of what each discourse contains. We quote from the memoir of Isaac Barrow.

"Barrow's tutor during his undergraduate-ship had been the celebrated Dr. Duport, Greek professor, and afterwards Dean of Peterborough; who, as one of his learned successors in both these pieces of preferment, has well observed, appears to have been the main instrument by which literature was upheld in the seventeenth century; and who, though seldom named and little known at present, enjoyed an almost transcendent reputation for a great length of time amongst his contemporaries, as well as in the generation which immediately succeeded. This eminent scholar, though ejected from his prebendal stall at Lincoln, and his archdeaconry of Stowe, for refusing the covenant, was yet suffered to retain his professorship, the duties of which he continued to discharge before a large audience during all the troubles and commotions of the civil war: but even this piece of well-merited preferment was taken from him in 1654 by the commissioners of University reform, who rejected from all offices, at discretion, such members as refused subscription to the engagement. According to Mr. A. Hill's account, Duport resigned the professorial chair, and recommended his favourite pupil, Barrow, for his successor, who justified his tutor's good

opinion of him by a very able probationary exercise, though he failed of success, through an opinion among the electors that he was inclined to Arminianism. It is stated, however, on better authority, that the commissioners themselves conferred the office on Ralph Widdrington, fellow of Christ's College, whose literary merits would probably not have had so much weight with those worthies, as his relationship to Sir Thomas Widdrington, commissioner of the Great Seal, and speaker of Cromwell's Parliament. Disappointed in this object of honourable ambition, and wishing to escape from the fanaticism which reigned in his own country, Barrow projected a scheme of foreign travel; nor can we wonder that a person with so cultivated a mind should be anxious to improve his knowledge of books by experience of the world; or that he should pant to survey the triumphs of modern art, and to traverse those delightful scenes where the spirit of antiquity still seems to linger. Accordingly, in the month of June 1655, after having sold his books to provide means for his voyage, he left England, and proceeded in the first instance to Paris: there he found his father, at the court of his exiled sovereign, and made him a seasonable present out of his slender *viam*. Soon after his arrival, he despatched a long letter to his college, in which he gives an amusing and instructive account of his journey, as well as of those objects which particularly interested him in the French capital. After a poetical, though somewhat confused exordium, he prays that the Goddess of Health may wing her flight to his beloved Alma Mater, in some flowing lines, which contain a curious compliment to the sedgy Cam, as well as to the regal Seine. The vessel in which he left his native shores seems to have been scarcely sea-worthy; a wretched bark, more like a witch's sieve than an English packet.

Thesea puppis rugosior, Argos
Que numerare annos, Argive foramina posset;
Ignibus expositi quam sævis dignior undis.

Accordingly, old Nereus, in pity or contempt, indulges the crew with a calm, which operates with terrible effect on the stomach of our fresh-water sailor; though he revives at sight of the lofty cliffs of Normandy, in which fine province he first sets foot on a foreign soil. The vessel enters that port, into which, as Barrow observes, the great Henry IV. ran his bark when almost shipwrecked in the waves of political commotion; alluding to that great monarch's flight to Dieppe, as a last place of refuge, in 1589, when he won the hearts of its citizens by his frank and manly address to them:—"Mes amis, point de cérémonie; je ne demande que vos vœux, bon pain, bon vin, et bon visage d'hôtes." Nor was it long before he who came a suppliant returned a conqueror, having gloriously defeated the army of the League, in the plain of Arques, when its commander, the Duke de Mayenne, retreated from forces ten times less than his own in numerical strength. Henry then rebuilt the castle of Dieppe, and conferred honourable titles on the city—*parvam titulis Diepam regalibus auri*. When our traveller lands, he is astonished at the crowd of women in the streets, and supposes that Henry, who was a great lover of the sex, was not unwilling to trust his fortune to such partisans: he notices, however, their general want of beauty, as well as their very irascible disposition; which is not at all surprising, since the fish-market of Dieppe rivals our Billingsgate, and the nymphs of such districts claim a right, from time immemorial, to

the free exercise of temper and tongue. The French ladies, however, seem to have been at this time desirous of extending their privileges; for he is witness of a desperate attack which they made on the hotel of the unfortunate collector of customs, after having loaded their aprons on the beach with weapons such as those which Telamonian Ajax hurled at his antagonist Hector. Dieppe does not present now the same features which Barrow saw and admired; for it was utterly destroyed by the English in the memorable bombardment of 1694, with the exception of the fine church of St. Jacques, that of St. Remi, and the castle, which stands on an eminence at the western extremity of the town. The adjacent country, however, does not seem to have changed its appearance, since our traveller described its broad roads and fertile fields, with rows of apple-trees for lines of demarcation, the ruddy colour of whose pendulous fruit inflames the bosom and invites the hand of the passenger. *He sata præcingunt, hæ compita cuncta coronæ.* After curiously describing the turning-lathe, he adverts to that exquisite manufacture in ivory, for which the place is still celebrated, and which owes its origin to the first Christian settlement on the coast of Senegal, which was made by the mariners of Dieppe. *Numidicum certant ebur in miracula rerum.* Thence he digresses to the numerous monastic orders, whom he lashes with great severity of sarcasm. Going to St. Jacques, he finds all his bile moved by the absurdities of the popish mass, by the decorations of the altars, by the vestments of the priests, and by the frauds of superstition practised in the nineteen little chapels, which stand round the body of that church, 'as chickens surround the mother hen.' He is horrified at the degrading mummeries and pageants exhibited in the religious festivals; but his fiercest anger is poured out against the idolatrous act of transubstantiation."

In which ceremony Barrow remarks of the priest,

"Se jactat fecisse Deum, factumque vorasse."

The following is somewhat amusing:

"We have seen that Barrow, after having introduced, and stimulated the academic world to pursue, an improved system of philosophical study, yielded his professorial chair to that friend whose occupation of it has rendered it one of the highest honours that science can bestow on her most favoured sons. With respect to himself, he devoted his powerful mind and vast acquisitions to the service of religion, whilst he adorned its doctrines by the purity and holiness of his life. He soon acquired the reputation of an admirable preacher; though Dr. Pope relates some curious scenes which occurred, as well by reason of his strange attire and attenuated aspect, (for he was not only worn down by study, but slovenly in his dress,) as by the detention of his congregation, and his discourses of an unconscionable length. In one instance, when he preached for Dr. Wilkins at St. Lawrence-Jewry, so uncouth and unpromising was his appearance, that the congregation scampered out of church before he could begin his sermon: the good doctor, however, taking no notice of this disturbance, proceeded, named his text, and preached away to the two or three that were gathered, or rather left together; of which number it happened that Mr. Baxter, the eminent non-conformist, was one, who afterwards declared to Dr. Wilkins that he never listened to a better discourse: amongst those also that remained was a young man who appeared like an apprentice, or the

foreman of a shop, and who pleased Barrow greatly by accosting him with these words of encouragement as he came down from the pulpit: *Sir, be not dismayed, for I assure you 'twas a good sermon.* When several parishioners came to expostulate with Dr. Wilkins on his suffering such an ignorant scandalous person to have the use of his pulpit, he referred them to Mr. Baxter, who candidly praised the sermon as it deserved, declaring *that he could willingly have been an auditor all the day long.* Confounded and put to shame by this judgment from a person whom they acknowledged as their superior, they soon confessed that they had not heard a word of the discourse which they thus abused, and began earnestly to entreat their rector that he would procure Dr. Barrow's services again, promising to make him amends by bringing their whole families to his sermon. All persons, however, had not the patience of the worthy non-conformist, as was evident when Barrow was preaching on a certain holyday at Westminster Abbey; for the servants of that church, who were then accustomed to shew the waxen effigies of the kings and queens, between services on holydays, to crowds of the lower orders, perceiving the doctor in the pulpit long after the hour was past, and fearing to lose that time in hearing which they thought could be so much more profitably employed in receiving, became so impatient, that they caused the organ to be struck up against him, and would not cease till they had blown him down. Can Dr. Pope, however, be credited, when he assures us that his *spittle-sermon* before the lord mayor and aldermen occupied three hours and a half? One is almost tempted to suppose that the customary invitation to dinner had been forgotten, and that the preacher took this ingenious method of revenging himself for the neglect. Being asked on that occasion, when he came down from the pulpit, whether he was not tired, his reply is said to have been—'Yes, indeed, I began to be weary with *standing* so long.'

We noticed this important publication whilst its editor was engaged with the works of Bishop Sherlock, for the collection of which, in their first complete edition, the literary world must ever feel indebted to him.

We conceive, however, that he has now conferred a still greater obligation, not only on the literary portion of society, but on the world at large, by the addition which he has made to the sermons of Dr. Barrow, from a MS. in the public library of Cambridge. We have here four sermons (with a large fragment of another) on some of the most important topics that can engage the human mind; and these composed with a copiousness of diction, a profundity of thought, a seriousness of feeling, and a glow of eloquence, that derogates not from those immortal discourses of the same author, which have long been before the public.

If the discovery of some fragments of a heathen philosopher, though relics of the eloquent Tully himself, created a sensation amongst the learned of all nations, shall these noble and perfect pieces of Christian philosophy, left by the greatest of British theologians, fail to excite an interest among his admiring countrymen? We hope not, for the credit of that nation which is capable of producing such men.

The Aeropterion; or Steam-Carriage: a Poem.

By J. Hardaker. 12mo. pp. 24. Keighley. We have long expected Poetry, as well as heavier, yea, and lighter materials, to be moved

by steam; and having the first instance now before us, we beg, rail-ing apart, to introduce Mr. Hardaker, of Haworth or Keighley, to the public, as the laureate of a steam, and worthy of his subject, i. e. of esteem. The high pressure upon his imagination, despising safety-valves, has been poured forth with a ten-bard power; so that, along the whole line of his way, he has been impeded by no obstacles, but run smooth and free from the beginning to the end.

The compound title is of Greek construction—*—æne air, and æripes a wing;* which seems to imply that vapour is winged air; and with "all ready" (the starting words of steam-carriages, as "all right" are of coachmen), off the author bursts in the full tide of song.

"I sing of scenes which science in its pride,
Inspired with genius, to the world reveals—
The iron-pave, where *Aeroptera* glide,
Like Phaeton's chariot with its flaming wheels;"

and, truth to say, no kettle we ever heard sing could sing like a steamer.

"The *Aeropterion*, on its iron-pave,
Outruns the river and outstrips the wind;
Fleeter than skiff upon the curled wave,
Leaving the eagle on her way behind:
Laden with hundreds of both gay and grave,
And all that men from earth and ocean reap,
All that is worthy of the great and brave,
Sweeping o'er mountain tops and valleys deep,
Calm as a dream that flits o'er gentlest sleep."

We like the idea of leaving the eagle behind, that, we presume, being the name of an inferior engine or car, and certainly not of the bird of Jove. With regard to the "calm," we are not so sure, seeing that on all the occasions with which we have been conversant, by sea or land, instead of calm, there has always been a most infernal clatter. Indeed, we once heard a housemaid of fine sensibilities, excited, too, by a voyage from London to Richmond, on a lovely summer day, with her sweetheart no doubt, express her sympathies for the steam-boat in very simple yet pathetic terms—"I pity her, poor thing (said she), she throbs so!" Where was Mr. Hardaker's "calm" here, we wonder? how can he reconcile such a phrase with the truth of poetry? The following is far better in praise of steam.

"The world sees
Those latent powers called forth from darkness vast,
Waking the slumbering intellect of the earth,
Another Neptune smokes across the seas,
Another Hercules in his works of worth,
Whilst genius wonders at her latest birth!"

And truly, though we are not going to examine this trifle minutely, we may state that the writer manifests a warmth very nearly allied to talents in the treatment of his theme; and, with much to provoke mirth, is frequently guilty of striking expressions: for example, where he styles the ancient and silent statues of Greece her "sculptured page;" but his extreme admiration of the big tea-kettles of modern science betrays him into extravagance. What will be thought of a rail-road to super-seede the equator? we have it in verse.

"This lengthened pave may belt the rounded earth,
The living girdle of a peopled souse,
Round which, like some bright meteor rolling forth,
Genius herself may guide her gliding throne:
It may be they who own a better birth,
That in yon spheres harmoniously sing,
This earth of ours may deem of better worth,
When thus now belted on its airy wing—
Another Saturn with another ring."

And now, his mind inflamed with the fancy of this iron circle round the earth, he conjures up creatures very different from Ariel to travel the distance in forty minutes—no other, in fact, than the sultanas, Georgians, and other "fine women," from Turkish harems, &c.

"With charms untold,
The gorgeous pomp of oriental sheen,
Falling their robes in many a luscious fold,
Curdee and cafton, wove in gold and green,

More fit for beings such as ne'er grow old,
But for this frail mortality, oh dear!
The very thought thereof makes one grow cold;
Yet why not flourish when transplanted there,
Th' expanding intellect that blossoms here?

Yes, we may see them, when this iron zone
Connects the German with the Caspian Sea,
Linking the Rhine, the Danube, and the Rhone,
And stretching onwards to the rich Crimea."

Hang up philosophy, unless philosophy can make a Juliet: hang up science, steam, and rail-roads, unless they can bring us an importation of sultanas. Long luck to the merchandise from the Crimea, though our ladies at home may think it a-crime. Unshackled trade is and shall be the order of the day. In the piping times of peace nothing shall be deemed contraband of war; there shall be no duties—free bottoms shall make free goods; and so success to Mr. Hardaker, to steam, and to a rail-road round the universe.

The Court and Camp of Buonaparte. A new edition. *Family Library, No. VIII.* 12mo. London, 1831. Murray.

WE are glad to see that great pains have been taken to make the new edition of this well-fancied book more worthy than it at first was of the Life of Napoleon, for which it was meant to be a sort of Appendix. We suspect another and a different hand has been employed; at all events, the volume is very much improved in every respect. We may quote, from the preface, a sort of review of Bourrienne's Memoirs, which have of late made so much noise.*

"With respect to the Memoirs of Napoleon's private secretary, M. de Bourrienne, the loud panegyrics with which their opening chapters were ushered into the world have not, most certainly, been justified by the main body of the book. The public were told, that having been six and twenty years about the person of his hero, this author would narrate 'nothing but what had taken place under his own eye,' and that his 'moral qualifications,' taken along with his opportunities, entitled him to claim rank as not only the best, but the only faithful portrayer of the private life and political principles of his deceased master. He was held up as having been towards Napoleon what Boswell was with regard to Dr. Johnson; and we were assured that his work would rank, in point of fidelity and integrity of intention, with one of the most fascinating as well as trustworthy pieces of biography in this or in any language. A few facts, drawn from the Memoirs themselves, will enable the reader to judge of the accuracy of these representations. Bourrienne was appointed private secretary to Buonaparte in April 1796, and retained the situation till October 1802; 'when,' says Savary, 'he was dismissed for peculation, the first consul abhorring nothing so much as illegal means of acquiring gold.' For nearly three years he lived in obscurity; but, in May 1805, at the intercession of Josephine, he was appointed French minister at Hamburg, and an agent of Fouché's police. He remained there till December 1809, when he was suddenly dismissed; and, on his return to Paris, the emperor refused him an audience. Upon Napoleon's overthrow, in March 1814, he instantly went over to the Bourbons, was made postmaster-general, and thanked, he says, by Louis XVIII., 'for the services he had rendered him at Hamburg;' that is, while he was the agent of Buonaparte. He held his new office only three

weeks. On going one morning to the Tuileries, to present his portfolio, it was unceremoniously taken from him, and access to the sovereign denied him. 'Not an intimation!' he exclaims; 'not a single line! no decree! no ordinance!' However, in March 1815, on the escape of the ex-emperor from Elba, the king, thinking fit to restore the odious ministry of police, Bourrienne, 'for his services to the royal cause,' was placed at the head of it. On the very day that Louis appointed him to the office, Buonaparte, at Lyons, denounced him as a traitor. It thus appears, from his own shewing, that, instead of being 'for six and twenty years about the person of this hero,' Bourrienne, during a part of the consulship and the whole of the empire, was not even permitted to approach him, and resided, for a great portion of that period, at the distance of a hundred leagues from Paris. Instead of narrating 'nothing but what took place under his own eye,' all his revelations, from 1803 to 1815, as far as Napoleon is concerned, are at second hand. It would be easy to trace the sources whence he has borrowed, without the slightest acknowledgment, his statement of every leading event. Thus, the long account of the revolution of the 18th Brumaire, is taken from certain valuable Historical Notes, supplied to Sir Walter Scott, which appear in the Appendix to the ninth volume of that illustrious writer's Life of Buonaparte;—his narrative of the conspiracy of Georges, Moreau, and Pichegru, is from Fauche Borel and Las Cases;—and the conversations which he pretends to have held with Rapp are all copied from that veteran's own Memoirs. Of the same stamp are his 'long and interesting interviews' with Bernadotte at Hamburg. The friends of the King of Sweden have notified, in the French papers, that the alleged interviews never took place; and a second reference to Sir Walter Scott's work will shew, that the details of the circumstances which led to Bernadotte's appointment to the throne of Sweden are all filched from the 'Reflections on the conduct of Napoleon towards the Prince Royal of Sweden,' drawn up for, and first published in, its pages. It was not to be expected that the private secretary would be long left by the friends and relatives of Buonaparte to tell his own story uncontradicted. Accordingly, in France, Generals Belliard and Gourgaud, Baron Meneval, Count d'Aure, Baron Massias, the present Prince of Eckmühl, the Duke de Cambacérès, Baron de Stein, and Count Boulay de la Meurthe, have stepped forward to expose the fallacy of many of Bourrienne's statements, and to deny that his 'moral qualifications' render him the only faithful portrayer of the private life and political principles of his deceased master. Count Boulay de la Meurthe states it to be the opinion among well-informed persons at Paris, that Bourrienne did not prepare the Memoirs for the press, but only supplied certain documents, notes, and recollections; and he adds, that the name of the real editor is no secret. 'I have gone over the work,' says this ex-minister of state, 'with a disgust which I cannot find words to express. Not that its contents have surprised me—I expected as much, from the extravagant way in which it was puffed on its first announcement; but what really does astonish me is, that this Bourrienne, who has so many grave reasons for keeping himself in the background, should have dared to stand forth before the public as the reviler of Napoleon and his whole family. From many causes, he is the last man on earth to be credited in matters re-

lating to them—a more disgraceful instrument could not have been employed. Where is the reader who will not shrug up his shoulders at seeing the discarded secretary affecting, in every page, the man of importance, and, what is still worse, setting up for a moralist? He shelters himself under the mask of impartiality, by here and there bedaubing Napoleon with panegyric: but who does not at once see, that this is only thrown in to give greater effect to his detestable calumnies?' Joseph Buonaparte, too, ever active in vindicating the object of Bourrienne's detraction, has, from his retreat on the banks of the Delaware, just sent into the world a collection of Notes, exposing many of the secretary's ungenerous and malignant misrepresentations. The cause of his restless hostility to Joseph is to be found in the ex-king's having denounced to the first consul a scheme of the confidential secretary to take advantage of his superior means of information for speculating in the funds, which led to his being discharged, and succeeded by Baron Meneval, at that time Joseph's private secretary. The following is the Count de Survillier's account of the transaction:—'Arriving one day from the country, Joseph was waiting for the first consul in his cabinet, where Bourrienne was sitting, surrounded by papers which required Napoleon's signature. After alluding to the great confidence placed in him by the consul, Bourrienne so far forgot himself as to make overtures to Joseph, which astonished as much as they distressed him. Joseph did not conceal what had occurred from his brother, who also, after breakfast, told Josephine of it. 'If Bourrienne,' said he to her, 'indulges in such insinuations with Joseph, who is almost a stranger to him, what must be the case with you, whom he sees every day?' Josephine replied, 'Who does not know Bourrienne?' It is only the first consul who will not know him.' Being from that moment narrowly watched, Bourrienne was soon known to the first consul, who was contented with dismissing from his service, instead of destroying, as he might have done, a man with whom he had been long connected. Joseph makes no scruple to assert that certain documents, which Bourrienne boasts of having in his possession—such as the narrative of the revolution of the 13th Vendémiaire, and the originals of the negotiations between Louis XVIII. and Bonaparte—were purloined from Napoleon's cabinet by the man to whose charge they were confided. 'Is M. de Bourrienne,' he exclaims, 'so blind as not to see, that this avowal of his breach of trust must astonish his readers? What a state would society be in, if people were suffered to boast that they possessed articles intrusted to their keeping! Can these autographs be the legitimate property of the private secretary? and if not, what are they but stolen goods?' It has excited surprise, that the schoolfellow at Brienne, the friend of early youth, the confidential secretary, should, throughout his ten volumes, have laboured to render the dark shades of his hero's character still darker. Joseph Buonaparte's note on his attempt to implicate the first consul in the death of Pichegru, will be found at page 403. With regard to the affair of the Duke d'Enghien, though Bourrienne contributes nothing to the history of this tragical catastrophe, he makes no scruple of loading his benefactor with the entire atrocity of the project. The following important statement, by Joseph Buonaparte, reached the present editor too late to be incorporated in the outline of the life of the ex-king of Naples and Spain:—'The idea of the

* While we insert this interesting extract, we at the same time beg to refer our readers to our own sentiments respecting Bourrienne—sentiments formed on no light authority. The fact is, that Bourrienne's early information is correct—the latter parts, mere book-making.

death of the Duke d'Enghien never crossed the first consul's mind, till he was astonished and confounded by the tidings communicated to him by Savary of his execution. The question was not whether he should be put to death, but whether he should be put on his trial. Joseph, Josephine, Cambacérès, Berthier, earnestly expostulated with the chief magistrate against it. Joseph, who was living at Mortfontaine, and transiently in town, on the 20th of March, the day the Duke d'Enghien was taken a prisoner to Paris, spoke to his brother in his behalf, warmly urging the defence of the grandson of the Prince of Condé, who, he reminded his brother, had seven times crowned him for as many distinctions gained at the Royal School: to which expostulation the first consul's reply affords a curious proof of the state of his mind at the moment. His answer was given by declaiming the following passage from a speech of Cæsar, in Corneille's tragedy of *La Mort de Pompée*:—

« Votre zèle est faux, si seul il redoutait
 Ce que le monde entier à pleins vœux souhaitait;
 Et si vous a donné ces craintes trop subtiles,
 Qui m'ôtent tout le fruit de nos guerres civiles,
 Ou l'honneur seul m'engage, et que pour terminer
 Je ne veuille que celui de vaincre et pardonner;
 Ou mes plus dangereux et plus grands adversaires,
 Mais qu'ils sont vaineurs, ne sont plus que mes frères;
 Et mon ambition ne va qu'à les forcer,
 Avant d'en combler leur haine, à vivre et m'embrasser.
 Oh! combien d'aise et de joie en si triste guerre
 Aurait-elle laissée de nous toute la terre,
 Si l'on voyait marcher dessous un même char,
 Vainqueurs de leur discorde, et Pompée et Cæsar! »

A full-length portrait of Talleyrand, engraved in his first-rate style by Wm. Finden, forms a novel feature in this edition. The head of the prince in the former edition was well, but this is better. The other decorations are as before.

The Turf. 2 vols. 12mo. London, 1831. Colburn and Bentley.

THE title-page tells us this is a satirical novel; and who would doubt the veracity of a title-page? Not we: for all we know of the work is, that it is a stupid account of swindlers and demireps, which has no claim whatever to publication.

Old Sketches. By the Author of "Poetical Aspirations." 12mo. pp. 172. Edinburgh, 1831. Skeaf.

WE regret to speak of this book as a failure; for it is unpretending, which is about its only merit. The best we can do for it is to quote two epigrams—the prose tales being quite mediocre, and the poetry of the same caste.

“ *The Parting.*
 It is your will that we should part—
 Good by, then, girl, with all my heart!
 And I am thankful that I may
 Carry the whole of it away.”

“ *No Change.*
 They bid me seek on Ganges' strand
 A wealthy man to be;
 But, were I in a foreign land,
 They find no change on me.”

Bussola per lo Studio pratica della Lingua Italiana, per ordine di Difficoltà, &c.—A Guide for the practical Study of the Italian Language. By F. C. Albites, of Rome. 12mo. pp. 302. London, Treuttel, Würtz, and Co.

THE author, persuaded of the general distaste for *præfæces*, commences his work by the system he has adopted of teaching the language, which affords a facility of acquiring its know-

ledge, without a useless loss of time, combining the *utile dulci*. He gives an alphabetical list of idioms, extracted from the best writers, with a French translation; then twenty-five new dialogues upon interesting subjects, with a few national anecdotes. He proceeds to mention some account of his late father; and, although it has no connexion with his system, we recommend his present volume to the attention of those amateurs of the Italian language who are desirous to become acquainted with the style of the best prose writers and poets, as well as to acquire the means of forming an elegant manner of correspondence, a subject also particularly treated on by Signor Albites.

The Romance of History. (England.) By H. Neele. 3 vols. 12mo. London, 1831. E. Bull.

WE are glad to see this useful and entertaining publication in a fourth edition: it is a good sign of the taste of the times when works of its class become so popular.

The Works of William Robertson, D.D. To which is prefixed an Account of his Life and Writings. By Dugald Stewart; and a Portrait, engraved after Reynolds. Large 8vo. pp. 1214. London, J. Ogle Robinson: Liverpool, Baynes.

FOR a capital historical library in one volume we are again indebted to the publisher's cheap, comprehensive, and admirable plan. The whole of Dr. Robertson's works, in double columns, with a clear and large type, for 24s. is really an extraordinary production. The justly celebrated histories of Scotland, of Charles V. and of America, with, also, the disquisition on Ancient India, notes, well-arranged indexes, and a Memoir by Dugald Stewart, need only to be enumerated as the contents of this volume, to recommend it most generally to the public.

Orlando Innamorato di Bojardo, &c. &c. By Antonio Panizzi. Vol. IV. pp. 379. London, 1831. Pickering.

HAVING so recently spoken of Vol. III. of this very accurate and handsome edition of Italian poets, we need only say that, by his careful collation of all preceding authorities, and by the exercise of his own fine taste and judgment, Signor Panizzi is producing an admirable work. The Notes to the present volume are just and critical: worthy of a classic.

The American Almanac and Repository of Useful Knowledge for 1831. Boston, Gray and Bowen; London, O. Rich.

CONTAINS a great deal of local and general intelligence respecting America, which must be useful for reference in Europe. We believe it is the second volume; and the whole design promises to be of permanent utility.

The Scientific Gazette, &c. 8vo. Weekly Numbers. London. Griffiths.

THIS little *Scientific Gazette* has now reached its seventh No., and promises well. We do not see why there should not be a weekly Gazette devoted to the various branches of natural and physical sciences as well as to literature; but if the Journal before us would wish to prosper, it should take a much higher tone. There is something requisite for the success of a scientific periodical more than the mere reprint of scraps from other journals, bad descriptions of animals which are well described in most elementary works, and essays on the state of science in Great Britain—a state

of which the Journal before us would afford but a sorrowful notion. There are, however, some good articles: such as the essay on spontaneous combustion, a valuable compilation; the views of the progress of science on the continent; and the remarks on the French school of philosophy, which are written in a sound tone of moral feeling, though somewhat abstruse from a want of development. The reviews have hitherto been extremely unpretending; and we sincerely advise the editors to avoid typographical errors, which are the bane of scientific publications.

Practical Instructions for the Formation and Culture of the Tree-Rose, &c. 18mo. pp. 144. London, 1831. Hatchard and Son.

THE author says the rose has long borne the “*belle*” from other ornamental shrubs; but in spite of this slip at his outset, we find his Instructions very minute and practical, so as to afford ample information to those who love to cultivate the innocent and interesting amusement to which they relate. The tree-rose is a beautiful plant; and we know not whether these lessons might enable us to rear it in perfection near London, which is at present rarely, if ever, accomplished.

The Genders of the French Nouns, according to their Terminations, rendered easy to Children by familiar Rhymes. Pp. 16.

Spelling made Pastime; in a moral Story. Pp. 15. London, J. Hearne.

THESE are two slight efforts to recommend the early rudiments of education to children; the first being the most useful. Any device which is calculated to attract the attention and fix the memory of infancy is worthy of the regard of mammas; to whom these tiny vols. may therefore be recommended.

ARTS AND SCIENCES.

ROYAL INSTITUTION.

THE second weekly evening meeting took place on Friday; Mr. George Moore in the chair. The lecture was by Mr. Ainsworth, “on the determination of the age of rocks of supposed igneous origin.” After remarking the difficulty which presented itself in at once understanding the details of a subject which required much illustration, and embraced the fundamental principle of the history of the earth, he proceeded to make some observations on the language of geology and its classifications, which were founded on the relative age of mountain-rocks, on their succession or superposition, or on their supposed mode of formation; but if founded on their composition, structure, and position, would present a series of stratified and unstratified masses of igneous and of Neptunian origin, to which granite would be a point of reunion, passing, on the one hand, into the stratified, and, on the other, into the unstratified masses. There existed, as yet, few facts to determine the exact age of the latter; they presented to the geologist a series which had rocks composed of felspar, quartz, and mica, at one extremity, of felspar and quartz in the centre, and, at the other extremity, rocks of felspar and augite. This series also exhibited a continuation, not interrupted, of continually increasing differences and decreasing resemblances, which (of importance to science) had also always struck geologists, who, according as they gave most importance to the one or to the other, ascribed to them a similar or dissimilar origin. The distribution of granites of igneous origin was much greater than had been sup-

“ In contradiction of Bourrienne's assertion, that *Hampe* was totally insensible to the charms of elegant poetry, Joseph states, that his brother knew by heart, and often recited, the most brilliant passages in the tragedies of Corneille, Racine, and Voltaire.”

posed, and extended as far as the *lias* (*Pro-dazzo*) and the middle oolites (ord of *Caithness*), and, when elevated by subjacent masses of *aegitic porphyries*, even to the latest tertiary rocks. The limits of the ophiolitic rocks were not well known. Mr. Ainsworth dwelt upon the distribution of the porphyritic rocks, more especially the transition formations, pointing out the difficulty of drawing deductions either from position or from their mineralogical characters. The porphyries of Saxony reposed on transition slates, but, in the absence of that formation, on older rocks. It was difficult to study, step by step, an edifice of which we can scarcely comprehend the order amidst a confusion of parts. In granite the terms were simple, in the porphyries they were complex. The transition rocks with metalliferous veins in *Dumfries-shire*, were more ancient than the porphyries with greywacke and domes of *trachyte* and *obsidian* on their limits. The same relations existed in the equinoctial regions of the new continent, in Hungary, and in *Auvergne*, in the Greek islands, at *Unalaska*, and in the *Kasbec* (*Caucasus*). Porphyries became granular, passing into *sienite*; porphyroidal, passing into true porphyries, and, from the predominance of vitreous *felspar*, passing into *trachytes*: such were the porphyries which ranged like fortified castles along the ridge of the *Andes*, the porphyries of the table-land of *Quito*, of the *Drachenfels*, and of many parts of Europe. The situation of these porphyries was beneath the old red sandstone: the trap-rocks were above that formation. Mr. A. pointed out their real situation by references to the geological structure of the environs of *Edinburgh*, of *Dumfries-shire*, and of *Derbyshire*. The same formations exhibited a constancy of direction though not stratified, and supported by their situation the theory of anciently elevated masses. *Auvergne*, to which he next directed the attention of those present, was a country of the greatest interest to geologists: it was like walking among the ruins of *Pompeii*, compared with the perusal of hieroglyphic inscriptions on some monument. He rapidly sketched the history of discoveries made in that district by different geologists, and pointed out the order of succession between the different phenomena of the eruption of volcanoes; the formation of lakes whose banks were covered with an extinct vegetation, and trod by strange animals which are no longer met with on the surface of the earth; the deposition of lacustrine rocks, and the excavation of valleys; the elevation of the *trachytic domes*, and disruption of the strata; the re-appearance of lava-currents, and the destruction of antediluvian animals. Greece was the next field of his illustrations: it presented three distinct epochs—that of *trachytes*, *porphyries*, and *leucositines*; that of *trachytic conglomerates*; and the eruptions which occurred within the period of history. The last period led to the consideration of active volcanoes. It was an error to look upon all craters as craters of eruption. He had not time to enter into the details of the nature and characters of the craters of elevation; but he referred to the appearances of many islands in the Greek archipelago and the *Azores*, as favouring such views of volcanic action; views which were further supported by the position as well as composition of tufa, and by analogous facts. After noticing the distribution of igneous rocks with regard to mountain-chains, and *Elie Beaumont's* views, which, when admitted, would require an entire remodelling of geological science, in a rapid summary he alluded to the periods

of quiescence and interruption which were marked in the characters of the sedimentary deposits, and the appearance or disappearance of organic remains; views which had been glanced at by Professor Buckland, in his researches on the distribution of *coprolites*, and by De Humboldt in his considerations on the independence of formations. Volcanic action, he remarked, could no longer be reasoned upon without embracing the theory of the earth. The researches of the illustrious and lamented Davy had paved the way to researches on the nature of this action; and, amid the daily increasing perplexities of geological science, the effects of heat had been more and more acknowledged as of the greatest importance—both on account of their influence and extent, and because they established a comparison between ancient results and modern action.

After the lecture, Mr. Faraday called the attention of those present to two very large masses of silver, which during their fusion had, from the development of a gaseous fluid (oxygen), exhibited a kind of volcanic action. He was not visionary in saying that there were some distant prospects of gaining some knowledge of the basis of metals, and they kept a keen eye upon phenomena of that kind.

There was placed in the library a very fine head of *Voltaire*, said to have been modelled from life; but, because of the exceeding beauty of form exhibited about the temples and elsewhere, it was considered by several of the eminent artists present rather as a cast from life. Also specimens of rare minerals from South America; collected and presented by Mr. Bollaert, formerly chemical assistant in the Institution. Samples of very improved *Wedgwood* ware, intended for the laboratory. This manufacture is able to resist the action of the acid, and other agents usually employed in the laboratory, and also to stand, to a superior degree, the application of heat. We noticed, likewise, a variety of iron ores; fossil wood from *Nassau*; cakes of English silver, with peculiar configurations; models of various kinds,—amongst them, one of Mr. Curtis's ingenious contrivance of the acoustic chair, described in the *Lit. Gaz.* of the 29th ult.; together with presents of books, both English and foreign.

Friday, Feb. 4th, Mr. Brande "on the relation of the *vegeto-alkalies* to common alkalies, and to certain proximate principles of vegetables." The lecturer first took a brief view of the beautiful investigations of Sir H. Davy into the nature of the alkaline bodies *potassa* and *soda*, which our lamented philosopher considered in his early days as elementary substances, but which he afterwards decomposed and proved to be metals and oxygen. Mr. Brande then traced Sir H. Davy's views through his investigation of the third acknowledged alkali, *ammonia*, known to be composed of hydrogen and nitrogen, but so analogous in many of its relations to the other, or fixed alkalies, as to excite great hopes that the problem of the nature and constitution of the metals might, through its means, be partly or even wholly solved. Mr. Brande dwelt in an impressive manner upon the value of analogy, when bounded, as it always ought to be, by the results of experiments; and he shewed how far Sir H. Davy followed the clue which analogy gave to him, and where he stopped short, when opposed by the facts resulting from his inquiries. Mr. Brande then referred to the numerous alkalies discovered during late years to exist in vegetable bodies, capable, like the others, of neutralising acids and of forming salts; but, unlike them, being com-

posed of three or four well-known elements, oxygen, hydrogen, carbon, and nitrogen. The analogies which before led from *potassa* and *soda* to *ammonia*, now conducted the experimentalist to these bodies. The endeavours made to obtain any simple or compound substance, from their resembling a metallic base, was next described. As to the accordance of the salts of these substances with ordinary salts, the results of their decomposition by the *Voltaic poles* was perfect; the *morphia*, *cinchonia*, or *quinia*, separating at the negative pole. Mr. Brande made numerous chemically-interesting references to the separation of these bodies, the tests for detecting their presence, their peculiar medical qualities, sources, &c. He also shewed the new proximate principle of the *willow bark saliani*, and referred to its analogy with *cinchonia* and *quinia*; likewise a new *vegeto-alkali*, obtained by Mr. Hennel, of *Apothecaries' Hall*, from *elaterium*, (wild cucumber,) which was perfectly crystallised, salifiable, intensely bitter, and probably very poisonous. This substance will, we understand, shortly be described in detail.

A magnificent collection of volcanic specimens from *Vesuvius* was laid upon the library-table; they were presented by Mr. Poli. Amongst them we observed the organic fossils of the limestone of the *Apennines*, ejected, as we understood, from the crater. Mr. Daniell also exhibited his new *pyrometer*.

ZOOLOGICAL SOCIETY.

J. E. BICHENO, Esq. in the chair. Mr. Vigors read the monthly report: it stated that in the month of January last, 940 persons had visited the museum, the receipts for which amounted to 24*l.* 17*s.* At the gardens, during the same period, there had been 2282 visitors; amount received, 85*l.* 10*s.* The balance declared on the month's account, in favour of the Society, was 57*l.* The report further stated, that the works in progress at the gardens and farm were complete, and that no further works were in contemplation at either establishment. A very pleasing announcement was made, viz. that the interesting meetings of the Committee of Science and Correspondence were in future to be open to all the fellows; an arrangement which must give entire satisfaction. Further, that the members should be admitted, free, to Mr. Vigors' approaching course of lectures on ornithology at the Royal Institution. General Thornton's motion relative to the disposal of so much of the farm as was rented of Mr. Palmer, was withdrawn till the anniversary meeting; and Mr. Cox's resolution for the building of a suitable museum was carried. A great variety of donations connected with the science of natural history were exhibited. Lord Suffolk presented a female pheasant which had assumed the plumage of a male! it was a very beautiful specimen. Mr. Gould presented the second part of his splendid illustrations of the birds of the Himalaya mountains, which excited great admiration. A conspicuous object in the meeting-room was the Society's noble lion, which recently died from inflammation of the stomach. The skin has been stuffed by Mr. Gould: the attitude is so natural, and the configuration of the head preserved so perfectly, that it was remarked, had he been placed in his den, the bystander could scarcely discover him to be a stuffed specimen. Sixteen fellows were elected, and Capt. Beechey, Harris, and Glasspoole, as corresponding members.

ASTRONOMICAL SOCIETY: ANNIVERSARY.

YESTERDAY the anniversary meeting of this Society took place.—Sir James South, the president, in the chair. The gold medal of the Institution was awarded to M. Damoiseau, of Paris, for his memoir upon the Theory of the Moon, and for his Lunar Tables. Another gold medal was awarded to Capt. Kater for his Vertical Floating Collimator. The President, in delivering these prizes, animadverted on the benefits which astronomy would derive from the respective works of these distinguished men of science. The medal is struck by Mills, and bears on the obverse a fine profile of Newton, and on the reverse the Herschel telescope. Officers for the ensuing season were elected.

LITERARY AND LEARNED.

ROYAL SOCIETY.

DAVIES GILBERT, Esq., V.P., in the chair:—A paper "on a new combination of chlorine and nitrous gas," by Edmund Davy, Esq., F.R.S., was read. Sir Philip Egerton, Bart., was elected. Capt. Manby was proposed. The following, amongst other donations, were announced:—Six volumes of the Memoirs of the Brussels (late Royal) Academy of Science and Belles Lettres; a Compendious Grammar of the Egyptian Language, as contained in the Coptic and Sahidic Dialects, by the Rev. Henry Tattam; and the 87th Part of the Flora Batava, presented by the King of the Netherlands.

SOCIETY OF ANTIQUARIES.

THURSDAY, Lord Aberdeen, the president, in the chair. Several members were elected. A communication was read from the Rev. Guy Bryan, accompanied by two beautiful drawings, descriptive of Hurstmonceaux castle, near Hastings. The staircases, composed of brick, without any timber, are stated by Grose to have been so extensive and intricate, that a man might easily lose himself in them; and the oven is fourteen feet in diameter. The paper contained an account of the family of Farnes, the former owners of Hurstmonceaux, one of whom, in the 1st Hen. VI., obtained a license to fortify and castellate his residence there, and to add 600 acres to the park. A communication was also read from Lord Mahon, relative to the discovery of the holy cross, and the travels and vicissitudes of that valued relic for about twelve centuries. In the time of Constantine the Great, the Empress Helena made a pilgrimage in search of the holy cross; three were found, and that of our Saviour, distinguished by the miracles and cures performed by it, was brought to Constantinople, and exhibited to the wonder and veneration of the Christian world; and so many pieces were obtained, that if all the relics of the holy cross were got together, they would build a line-of-battle ship. Still, the principal part remained at Constantinople: it was afterwards taken by the Persians, who possessed it for fourteen years. Being again recovered from them, Heraclius, after a dreadful massacre of the Jews, saved it with great ceremony on Mount Calvary. The Mahomedan Arabs, however, having succeeded against the Christian forces, Heraclius, tired and dispirited, removed the relic again to Constantinople, where great honours were paid to it, and being laid on the altar, it is said that a fragrant perfume was spread through the church, and oil was seen to ooze from the knots of the wood. It was subsequently carried to Palestine in the crusades, and in one of the battles with Saladin it got severed, and half

of it was taken by the Saracens, and probably destroyed by them: the remainder was at last bought, at an enormous price, by the French, and rested at Paris for about 300 years; when at length it was missing, and all endeavours to discover it were fruitless. The loss of the precious relic affected the people to such a degree, that an insurrection was dreaded, and the king, to appease them, had an entire new cross made and presented to them, which he assured them possessed equal virtues, and was as worthy of their respect and veneration as the lost one; and the good folks of France, finding that they could not recover their old idol, at last put up with a new one.

ROYAL ASIATIC SOCIETY.

SIR GEORGE STAUNTON, Bart. in the chair. The Earl of Mount Norris was proposed, and being a member of the Bombay branch Society, was immediately balloted for and elected. This nobleman, it will be recollected, when Lord Valentia, travelled through India into Abyssinia, Egypt, &c. The chairman made another splendid donation to the Society, viz. the Memoirs of the French Academy of Sciences (now the Institute) from its commencement in 1786, in 43 vols.; together with D'Anville's Notices sur Gaule; a series which contains many valuable papers on Oriental literature, by D'Anville the elder, De Guignes, and others. Mr. Baber presented a curious box, neatly carved, with hinges, out of a block of hornblende, having on the outside of the lid three sculptured figures, and, in the inside, one of a celebrated Jain king. The box is made of the same kind of stone as that which forms the pillars of Hyder's mausoleum. Two papers were read; the first by Mr. Huttman, comprising two anecdotes of violation of caste by a native prince, which testified that the difficulties of this barrier, though great, are not altogether insurmountable. The other paper gave an account of the week days of the Hindus, their gods, and the religious ceremonies peculiar to each day: it was communicated by Colonel Tod.

ROYAL SOCIETY OF LITERATURE.

FEB. 2.—The Secretary read a letter from Mr. J. Cullimore, detailing the principles upon which the writer has proceeded in his attempt to restore the lost fragment of the hieroglyphic tablet of Abydos. A letter was likewise read from Sir Thomas Phillips, containing a catalogue of Pictish and Scottish kings, taken from a manuscript of the thirteenth century, in Sir Thomas's possession. This catalogue is different from that given by Innes, and, in some particulars, more correct. A further portion was then read of Professor Lee's memoir on the heathen idolatries. Adverting to the Mohammedan faith, the professor shews that the corruptions of that system, which began to take place in the time of El Mamun, the seventh calif of the house of Abbas, were derived from the same sources, and were identical in character with those which the early philosophical heretics introduced into the Christian church. A specimen of Egyptian writing, on papyrus, of extraordinary beauty, and in the highest state of preservation, was submitted to the inspection of the meeting by Sir William Ouseley. This document is the property of—Kirkman, Esq. A fac-simile of the inscription will probably be published by the Society. Various presents of books were announced; among others, Professor Revens's Letters to M. Letronne on the Græco-Egyptian monuments in the University of Leyden, and some

of the publications of the Baron de Reiffenberg. Two manuscript letters from Dr. Burney, author of the History of Music, and from Mr. J. C. Walker, the historian of the Irish bards—addressed to J. Balfour, Esq.—were likewise presented by that gentleman.

FINE ARTS.

BRITISH INSTITUTION.

[Third notice.]

No. 148. *A Servant Girl at Antwerp*. H. Howard, R.A.—It may be an ungallant remark, but from what we have seen of Flemish features in the works of Flemish art, we cannot help suspecting that Flemish beauty is much indebted to Mr. Howard for this flattering view of it.

No. 171. *The Signal*. H. P. Parker.—We have seldom met with a more animated and spirited production.

No. 183. *The Widow*. C. Hancock.—This truly pathetic scene, in which the widow is caressing and pouring out her sorrows on the favourite dogs of her departed husband, is, as far as our recollection serves us, entirely original; and the conception of it does as much credit to the mind and feelings of the artist, as its execution does to the powers of his pencil.

No. 184. *The Sleeper*. Andrew Morton.—Of the minstrels of Savoy the English public have, of late years, had a sufficient visitation; and no one has more skillfully and more frequently depicted their costume and character than Mr. Morton. He may now be said to have set the subject at rest, and we trust that he will henceforth allow it to

"Sleep the sleep that knows no waking."

No. 185. *View in the Back-Court of a Dutch Habitation*. Albert Brondgeest.—A tolerably successful imitation of Peter de Hooe.

These, with No. 56. *Claudia in Rienzi*, Miss E. Drummond; No. 60. *Taken by Surprise*, R. Farrier; No. 91. *A Study*, Mrs. Pearson; and No. 161. *Walnuts*, No. 164. *Filberts*, A. Oliver, A.R.A. (which made us long for a little salt, a bottle of port, and a pleasant old friend, like the artist himself), are some of the principal attractions of the North Room.

MIDDLE ROOM.

No. 215. *The Pedlar*. J. P. Knight.—Next to visiting a fair, the appearance of a pedlar in a country village is the most exciting circumstance that can occur. It is then that gew-gaws and finery become, in the rustic female vocabulary, absolute wants and necessities; and not a lad or lass but will soon dive to the bottom of a shallow pocket, to purchase the tempting bait. Perhaps Mr. Knight may have made this modern Autolycus too respectable in appearance; otherwise, the characters are well discriminated. The execution is excellent.

No. 220. *Teniers painting the Temptation of St. Anthony*. A. Fraser.—Here are two temptations—the temptation of St. Anthony, and a temptation to every lover of art, who may visit the British Gallery, to become the possessor of so fine a picture. If we were disposed to be hypercritical, we would say that the composition is rather too scattered; but in truth and richness of tone, facility of handling, and identity of style with that of the great Flemish painter, nothing can surpass this admirable performance.

No. 237. *Umbreleigh Mill, River Taw, Devon*. F. R. Lee.—Another example, and a still more striking one than that which we have already noticed, of Mr. Lee's powers. Without

the depth, or, rather, the blackness, by which Ruysdael and Hobbins frequently aid their effects, the clearness and the action of the water in this picture are in no way inferior to similar representations by those celebrated masters.

No. 247. *The East Window of Netley Abbey*. W. Shayer.—A beautiful specimen of the picturesque, with a skill in the execution that does Mr. Shayer great credit.

No. 248. *Low Life and High Life*. E. Landseer, A.R.A.—Like Burns, in his "Two Dogs," although in a somewhat different manner, Mr. Landseer has here produced an admirable pair of canine representatives of democracy and aristocracy:—the one a sturdy bull-dog, maimed and disfigured by a hundred contests in the ring, but presenting a bold and erect front, with an expression that would induce any prudent person to keep at a respectful distance from him; the other, a superb dog of the chase, with a graceful turn of the head, and with all the *nonchalance* of Grovenor Square in his countenance. The accessories are in perfect accordance with the principals: in the one, a butcher's block, a pewter porter-pot, a pipe, and a pair of top-boots; in the other, the sword, belt, and cuirass of a butcher of another kind—an officer of the life-guards, and the various decorations of a fashionable drawing-room. Of the effect, colouring, and execution, it is enough to say, that they are in Mr. Landseer's best style.

No. 249. *Milking*. J. Linnell.—A perfect gem of art, in which the cattle and the effect would do credit to the pencils of Paul Potter and Cuyp.

No. 250. *The Wine Cooler executed by Rundell and Bridge, by command of his late Majesty, George IV.* George Lance.—Reflections of a melancholy and painful nature must arise in the mind of every one who views this superb article of royal magnificence. As a painting, we think there is hardly enough of weight, or contrast, in the accessories, to balance the gorgeous and obtrusive quality of the gold, occupying, as it does, so large a space. Why has it been thought more advisable to insert in the catalogue the names of the mere tradesmen (respectable as they are) who furnished the metal for this Cellini-like work of art, rather than those of the tasteful and able designer, modeller, and chaser, by whose united talents it was actually produced?

No. 268. *The Book*. H. P. Bone.—In the happily improved state of female education and acquirements, subjects of this description are as frequent as they are pleasing. Mr. Bone has treated the present one with great simplicity, and the expression is perfectly natural and unaffected.

(To be continued.)

NEW PUBLICATIONS.

Rural Amusement. Engraved by John Bromley, after a Painting by Sir T. Lawrence. Colnaghi, Son, and Co.

THIS beautiful production is a companion to the very popular print of young Lambton; and having more of subject, is likely to be no less a public favourite. Two fine youths, with countenances of great expression, have got the head of a favourite ass between them; and the group is admirably composed. There is a lovely touch of landscape on the foreground and on each side: the whole a charming relic of departed genius. With regard to the mezzotint of Bromley, nothing can be more spirited. The lights are thrown on almost daringly; but the effect cannot be surpassed in this style of art.

King William IV. From a Drawing by Sir T. Lawrence; engraved by F. C. Lewis, Engraver of Drawings to the King. Colnaghi, Son, and Co.

THIS work reminds us forcibly of the way in which the late president used to prepare his canvases in chalks previous to painting his portraits in oil. It is the very transcript of such a sketch, executed with great freedom, and a very strong likeness of the king, of the life size. We have sometimes regretted that Sir Thomas should paint upon these preparations, and we now rejoice to have a fac-simile of one so interesting.

The Fish Market. Painted by Bonington; engraved by G. P. Quelley. London, Carpenter and Son.

EVERY lover of art remembers this admirable picture of Bonington, in which the grouping and composition might vie with the best masters of the Flemish school, on the principles of which it is evidently painted. The engraver has made a faithful copy of it, and proves himself a very rising artist. Not to speak of the shipping and figures, the haze on the right is finely represented, and the lights put in with a masterly hand.

Engravings of Ancient Cathedrals, Hotels de Ville, and other Public Buildings of Celebrity, in France, Holland, Germany, and Italy. Drawn on the spot and engraved by John Coney; with Illustrative Descriptions by Charles Heathcote Tatham, Esq., and able Assistants. Parts I. to VI. Moon, Boys, and Graves.

THIS is a truly laborious and magnificent, and, of its kind, an unrivalled work. It is to be completed in twelve parts; and the subscribers to it will, when the remaining parts shall appear, have a much more ample and satisfactory idea of the richness and variety of continental architecture, than they can obtain in any other manner than by actual inspection. The plates are of a large folio size, and although engraved only in outline, prove of what the most simple means are capable, when under the direction of knowledge and taste. Mr. Coney has shewn a perfect understanding of his subjects; and in the execution of them has mingled delicacy and boldness, to an extent which we have never seen surpassed, and which has been productive of the most beautiful effects. The absence of shadow is, in one respect, exceedingly advantageous, as the real forms are thereby rendered much more distinct than they would otherwise be. Nor, although a minor merit, must we omit to notice the spirited and masterly groups of figures, the introduction of which imparts great animation to the various scenes. Every number contains, and is to contain, four plates. Of those which have already been published, our favourites are, the "Cathedral at Antwerp;" the "Cathedral at Brussels;" the "Hotel de Ville," at Ghent; the "Cathedral at Beauvais;" the "Cathedral at Rouen;" the "Hotel de Ville, at Brussels;" but we find our admiration is betraying us into giving the whole list, instead of a selection. The descriptions are brief but perspicuous; they are in the English, French, Italian, and German languages.

Designs for Farm Buildings. By P. F. Robinson, Architect, F.A.S. Nos. VII. to XII. Carpenter and Son.

THIS exceedingly clever and picturesque publication is now completed—or rather, the two distinct works of which it consists are completed; for Mr. Robinson states, that as the

latter part of his publication relates more particularly to village architecture, he has determined, for the convenience of purchasers, to bind it up in two parts, and to designate the first seven Numbers "Designs for Farm Buildings," and the last five, "Village Architecture." Mr. Robinson has, in our opinion, completely succeeded in his object, which has been to shew that convenience and comfort in rustic buildings are perfectly compatible with agreeable and attractive forms; and that, in the words of Sir Uvedale Price, quoted as his motto, "the most painter-like effects may be produced, even by a mixture of the simplest things, when properly placed and combined with others." The various illustrative drawings have been executed on stone with great freedom and taste by Messrs. J. Scarlett Davis, J. D. Harding, T. Allom, &c.

ARTISTS, &c.—In our last we were compelled to confine ourselves to very brief notices of two (of three) artist and amateur conversations already established in London; in truth, as such meetings increase in number and spirit, the press, busy with so many matters, must fall short in details of their proceedings.

The "Artists' Conversazione," A. Cooper, R.A. chairman, another society similar to these, and the first of the kind ever established in this country, met, we believe, on Saturday. It is, however, confined to artists; and artists alone will never, in our opinion, do any thing to promote the interests of the arts.

BIOGRAPHY.

THOMAS HOPE, ESQ.

IT is our painful duty to record the decease of this gentleman, who died at his house in Duchess Street, London, on the 3d instant. Of an individual whose name and influence have been so extensively and intimately connected with the fine arts and literature of the country and the age, it would at once gratify our own feelings, and be interesting to a large portion of our readers, could we enter into a lengthened memoir; but the varied character of our weekly sheet is incompatible with such an essay. It is hoped, however, that some competent person will prepare and lay before the public an ample account of the life, travels, and writings of Mr. Hope, convinced, as we are, that it would be peculiarly interesting to the literary, scientific, and higher circles of society. In noticing the death of this gentleman, and reflecting on his many qualifications and varied talents, we cannot but deeply regret his loss, and sympathise with those surviving relations and friends who have been immediately in association with him, and also with a numerous class of persons who have for a long time participated in his patronage and kindnesses. By his demise, art has lost a liberal, discriminating patron,—literature a generous, ardent friend. He was not, however, merely a patron and friend to both, but was a proficient in the elements and principles of art, and an author of high and varied qualifications.

Some of the ancestors of Mr. Hope were baronets of Scotland; and one of them settled in Holland, where he amassed a large fortune in mercantile concerns. The Hopes of Amsterdam were proverbial for wealth, for the splendour of their mansion, and its valuable cabinet of pictures. One of the late Mr. Hope's brothers still lives in Holland, another in Norfolk Street, London. Early in life, Mr. Thomas Hope travelled over various

parts of Asia, Africa, and Europe; and, having acquired a facility of drawing, brought home a large collection of sketches, principally of the architecture and sculpture of the different scenes through which he had passed. Soon after his return to and settlement in London, he wrote and printed "A Letter, addressed to F. Anzeley, Esq., on a series of Designs for Downing College, Cambridge," in which he notices some of the countries he visited, and the architectural objects he examined, as a justification of his motives for criticising the series of plans, elevations, &c., then submitted to him. These criticisms were so poignant and condemnatory of Mr. Wyatt's designs, that they were rejected, and Mr. Wilkins was afterwards employed to commence the college. That gentleman's building has never been completed, and the part erected has been very generally disapproved. Purchasing a large mansion in Duchesse Street, Mr. Hope devoted much time and study, not only in finishing and fitting up the interior, from his own drawings, and partly in imitation of the best specimens of ancient and modern buildings in Italy, but made designs for the whole, and for the furniture of the house. Consisting of a picture-gallery, a statue-gallery, drawing-rooms, dining-rooms, cabinets for vases, &c. which he had collected in his travels, this house became an object of popular and fashionable attraction. The drawings which he had made for his furniture, &c., he afterwards published in a folio volume, which led the way to a complete revolution in the upholstery and interior decoration of houses, and also called forth the splenetic comments of the *Edinburgh Review*. Whatever ridicule a literary critic might attempt to cast on the work, and on the pursuits of a private gentleman thus engaged, it may be said to have proved truly innocuous; whilst the effects of Mr. Hope's publication and example have been extensively beneficial. They gave occupation, at the time, to many young and aspiring artists; they roused the young to emulation, and employed and remunerated the skill of others advanced in life. The genius of young Chantrey was called into action and excitement, whilst the more mature talents of Flaxman were honourably employed. Many artists, as well as artists, were awakened to exertion, and were also brought out from the gloom of obscurity and comparative wretchedness, and placed in the daylight of patronage and respectability. The writer of this brief imperfect sketch has heard Mr. Hope declare, that he frequently traversed obscure alleys, lanes, and courts, to find out and employ men of skill and talent in their respective pursuits. "To Mr. Hope," says Mr. Britton, in his work entitled "The Union of Painting, Sculpture, and Architecture," "we are indebted, in an eminent degree, for the classical and appropriate style which now generally characterises our furniture and ornamental details. Like most other innovations, his was described as whimsical and puerile by some persons, as if it were unbecoming a man of fortune to indulge in the elegant refinements which wealth placed at his command; whilst when caricatured the system, by cramming their apartments with mythological figures and scenes, jumbled together without propriety or meaning." Those who are familiar with the town and country houses of the late Mr. Hope, in Duchesse Street, London,* and at the Rectory, near Dorking, must admit that the

eye and feelings of the accomplished artist pervade the whole of their interiors; and that, whilst every sort of domestic comfort has been attended to and studied, beauty in forms and colours, and luxurious display, have been equally consulted. The drawing and dining-rooms, the galleries and boudoirs, as well as the bed-rooms and private apartments, in both houses, will amply justify and verify these remarks:—"In forming my collection, and in fitting up my houses," says Mr. Hope, in a manuscript catalogue now before us, "my object has neither been an idle parade of *virtu* nor an ostentatious display of finery. I have observed, with regret, that most persons employed in our manufactures, or in furnishing our habitations, are rarely initiated even in the simplest rudiments of design, whence it has happened that immense expense has been employed in producing furniture without character, beauty, or appropriate meaning."

In "The Costume of the Ancients," 2 vols. 4to, consisting of 130 engravings in outline, mostly from Mr. Hope's own drawings, is displayed a deep research into the arts of antiquity, and a familiarity with all that is graceful and elegant. This work tended greatly to improve the costume of the ladies. The historical and geographical romance of "Anastasius," in 3 vols., of which a third edition has been printed, evinced at once the general knowledge, the fancy, and powers of the author. It gives such a faithful picture of the customs, manners, and countries of the Turks and Greeks, that when a gentleman of high diplomatic station and abilities was advised to publish an account of his travels among those people, he replied that Mr. Hope had already given such an accurate and graphic description of them in "Anastasius," that there would be nothing new for him to relate. Besides these works, Mr. Hope contributed several papers to different periodical publications; and, at the time of his decease, was engaged in passing through the press a publication "On the Origin and Prospects of Man." He has also left a large collection of drawings and engravings, illustrative of buildings and scenery in Greece, Turkey, Italy, France, Germany, &c., and several plates of his antique sculpture and vases. It is earnestly hoped that his eldest son will so far follow the example, and emulate the noble spirit, of his father, as to lay some, if not all, of these works, before the public.

Mr. Hope has left an amiable and highly-accomplished widow, and three sons, to lament his loss; and that they must deeply feel and grieve over their bereavement, will be inferred, when it is known that he was a most affectionate husband, a fond and watchful parent, a kind and humane man to all his domestics and dependants. His knowledge was extensive, varied, and solid; and his humility and unostentatious habits and manners surprised every one who only knew a little of him, but rendered him an object of admiration to those who were honoured and delighted with his friendship.

DRAMA.

KING'S THEATRE.

THE opera season commenced on Saturday with *Il Barbiere di Siviglia*, in which Madame Sigl Vespermann made her *début* as *Rosina*. Previous to her appearance, two bad omens occurred: the first an apology for hoarseness, occasioned by our climate, so inimical to vocalists; and the second, a bit of a row, in conse-

quence of an attempt to omit the fine duet between *Almaviva* and the Barber. This the audience would not tolerate, and the scenery was awkwardly replaced, and the duet sung before the new prima donna was allowed to appear. She then came forward with the cavatina "*Una voce puoco fa*," which she gave with considerable execution and inconsiderable effect. Her voice is of the compass of about two octaves, but thin and deficient in melody. In person she is also thin; and a thin face was rendered unpleasing by ultra painting, especially of red under the eyes, by the constant use of the eyes expressively, and by the laborious management of the mouth, or lower jaw, in producing the difficult passages of the music. Some of her highest notes, as we perceived more distinctly afterwards in the music lesson, (a Spanish air,) are more curious than delightful; and altogether, from the want of quality, and the superabundance of ornament, we must say that Mad. Vespermann failed to excite either our enthusiasm or our admiration as a first-rate singer. De Begnis (whose return to these boards was warmly applauded), in *Don Bartolo*, was excellent; and Lablache gave more talent even than weight to the part of the Barber. Curioni, as the *Count*, was just in that (*quere*) happy mean which offers nothing to blame or to praise; and the other characters were sustained much as usual by Mad. Castelli, Signor de Angeli, and Signor Deville. In the diversissement and ballet of *La Sonnambule*, Mons. Paul, and his sister Mad. Montessu, made their bow and courtesy. The former revived all our recollections of his extraordinary powers as a dancer; and the latter, a petite and agile creature, seemed hardly, if at all, his inferior in rapidity and precision. As the *Sleep Walker*, of which she was the Parisian original, she played in a very superior style—her only want being youth.

DRURY LANE.

Il Fra Diavolo, translated into a novelty, as the *Devil's Brother*, does not improve. So popular is the name of this gentleman on the stage, that after having personally made his *début*, some years back, we are not now to be delighted with his brother, nor be induced to look forward, ere long, to his dam and the rest of his family. Mrs. Waylett being fairly put to bed is the best part of the piece: by way of lullaby, she sings very sweetly "Daylight, love, is past away," which she also introduced as *Jessica* in the *Merchant of Venice*, and doubtless will upon all other convenient or inconvenient opportunities. The plot is simply thief-taking; and were it not for a pretty closing scene, and a song or two of Sinclair's, the piece must, long ago, have slept with the Capulets. But, apropos of great and little theatres, the *Devil's Brother*, or *Catching a Thief*, as exhibited in this house. The plagiarism of passages from the Olympic production is notorious: for example, where *Zerlina*, while the brigands are concealed in the closet, stands admiring herself in the glass, and exclaims, "I'm not to be sneezed at!" which had a laughable effect from Vestris's piquant utterance, and which is not in Scribe's French. Ergo, Mr. Shannon used paste and scissors, even in this exclamation, upon which much of the plot turns: we subjoin Scribe's lines:—

"Où, voilà pour une servante
Une taille qui n'est pas mal;
Vraiment! vraiment! ce n'est pas mal;
Je crois qu'on en voit de plus mal!"

Act II. Scene 5.

* A full account of this house, with two plates, will be found in Vol. I. of "Illustrations of the Public Buildings of London," by J. Britton.

OLYMPIC THEATRE.

ON Thursday the very pretty and very French Miss Sidney appeared, for the first time, as *Leontine*, in Mr. Ainsworth's pleasant burletta, *The Lost Son*, the part previously sustained by Miss Foote. Miss Sidney was charmingly dressed, acted with great naïveté, and sung the sprightly little song, "Just like you," with infinite archness and effect, and, if we may be invidious enough to say so, better than her fair precursor. The piece is likely, we think, to have a run.

FRENCH DRAMA.—A meeting of seventy dramatic authors lately took place at Paris, for the purpose of appointing a special committee, consisting of nine persons, viz. six literary men, and three theatrical managers,—to offer their remarks to the Committee of Deputies charged with the consideration of the proposed law respecting the theatres.

VARIETIES.

Swan River.—Professor Jameson has communicated to the Wernerian Natural History Society a letter of recent date, from a settler at the Swan River, which (if not written by a disappointed man) confirms the worst forebodings as to the disastrous state of the colony. The gentleman by whom this letter was written was already on the point of leaving the colony; and many others, who have the means, are gradually withdrawing from the settlement to Hobart Town or New South Wales.

Improvements in Ships.—We observe, from the *Hampshire Telegraph*, that the *Acteon*, of 26 guns, just launched at Portsmouth, is not only built on a beautiful model, but fitted up with Captain Libou's rudder (of which we spoke so highly in a former *Gazette*); Mr. Harris's effective lightning conductors, of copper laminae; and a new windlass, invented by Mr. Pearce, master of the *Ganges*. We rejoice to see that, in this instance at least, the obstacles too often thrown in the way of ingenious projections have been surmounted.

Altar-Piece at Sheffield.—The *Sheffield Mercury* contains an interesting account of a sacred painting, from the gospel of St. Mark, "Suffer little children to come unto me,"—the work of Mr. Parris, and presented to the church of St. George in that town. It now adorns the altar, and is described as a magnificent picture: what else, though in a style with which we are not familiar from his easel, could be expected from the genius which revelled over all the extent of the Colosseum, or confined its exercise to the lovely imagination of the Bride-maid at the British Institution? From the opening of his career we have anticipated nothing but fame to Mr. Parris, and he is indeed rapidly gathering the laurels we foresaw.

An important Letter.—The city of Arras, while in the hands of the Austrians, was considered so strong, that an inscription was, it is said, placed over one of the gates, in these words: "Quand les Français prendront Arras, les souris mangeront les chats." The French, however, laid siege to it in 1640; and after having retaken it, they only obliterated the letter *p*; so that the inscription stood, "Quand les Français rendront Arras, les souris mangeront les chats;" and, in fact, they have retained possession of it ever since.—*Coney's Ancient Cathedrals, &c.*

Development of the Vegetable Germ.—M. Mirbel has offered to the Academy, in a new memoir, the results of his observations on the vegetable egg. It is, he conceives, the

history of the organisation and of the development of the ovules. He distinguishes five periods. In the first, the vegetable egg is in a nascent state. It is a pulposo conical excrescence, without any opening. In the second, the exostome and the endostome open and dilate until they have acquired the maximum of their amplitude. In the third, the *primine* and the *secondine*, soldered together, take an extraordinary growth, and hide the *tercine*, which often becomes a membranous substance. In the fourth, the quartine originates from the whole surface of the internal walls of the ovulum. It lengthens, and we discover, under the form of a globule, suspended by a very slack thread, the first outline of the embryo. In the fifth period, the embryo develops its cotyledons, as well as its radicle, and attains its natural size.

Shells on the Himma-leh Mountains.—Mr. Gerard has read a paper to the Physical Society of Calcutta, on the geology of part of the Himma-leh range. Among other interesting facts contained in this memoir, is the discovery of fossil shells, in very great abundance, at an elevation of above 16,000 feet, or a mile perpendicular, above the level. His astonishment was similar to that of Baron Ramond, when he found the *Manchots de Neptune* (Neptune's bracelets) on the summit of Mount Perdu. Since those days we have, however, not only learned to contemplate these remains as elevated to those lofty regions, but, by their species, and the nature of the rock, to estimate the period of their elevation and that of the mountain, the loftiest of which, both in Europe, in Asia, and in the New World, appear to be among the latest which have risen through the earth's crust.

Francis Moore, Physician, revived.—About the time of the eclipses of the two great luminaries of heaven last year, two kings died; one was obliged to fly before his rebellious subjects, and a fourth was hurled from his throne, and compelled to take refuge in a foreign country: the whole of Europe was in commotion. Shortly after these celestial tokens, the aurora borealis nightly hung forth its streaming banners over the northern regions of the globe,—a welcome signal to the oppressed Poles to throw off the shackles of slavery, and a gloomy portent to the autocrat of Russia, that a kingdom would be torn from his rapacious grasp. Scarcely had these coruscations ceased to glow, when a distinguished stranger (Mr. Herapath's comet) swung forth its ominous tresses over the southern hemisphere; which was followed by fires that reddened the sky, kindled by an infuriated peasantry. The pope died about this time. Let the politician consider well the two eclipses of the present month; one of the sun, *this day*, (12th inst.) occurring most singularly between two adverse signs, Capricornus and Aquarius; the other eclipse, of the moon, this day fortnight, in the martial sign Leo. Lord John Russell should look to this, and beware of the ideas of March. A month or two sooner or later between the omen and its direful accomplishment is no great matter; *the influences of the heavenly bodies are quic as unerring before as after any of their notable configurations.*

Madame Niebuhr.—The widow of the celebrated Niebuhr fell ill immediately after her husband's death, and died on the 11th of January last, the victim of her grief.

New British Moss.—Dr. Greville has added the *weissia elongata* of Hornschuck to our British plants. It was found among the rocks at the head of Loch Callader.

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. VII. Feb. 12.]

The tide of politics must run high; for we are told that, in consequence of the approaching discussion in parliament of the present government's plan of reform, the Quarterly Reviewers mean to put forth another No. of that Journal (though not due until the end of March) in the course of this month.

We have received the prospectus of another hebdomadal contemporary, to be called the *Christian's Magazine*, or *Weekly Miscellany of Religious Essays, Anecdotes, Literature, Biography, Intelligence, and Poetry*. We wish it all success, for the promises it holds out are of a very valuable kind.

A proposal has been issued for publishing a large Bronze Medalion of our veteran and celebrated painter, Mr. Stothard, from the bust by Bailey, and to be engraved by Mr. A. J. Stothard.

LIST OF NEW BOOKS.

METEOROLOGICAL JOURNAL, 1831.

February.	Thermometer.	Barometer.
Thursday.. 3	From 10. to 37.	29.36 to 29.14
Friday.... 4	— 39. — 34.	29.00 — 29.33
Saturday.. 5	— 31. — 39.	29.53 — 29.83
Sunday.... 6	— 21. — 38.	29.84 — 29.60
Monday... 7	— 30. — 51.	29.46 — 29.66
Tuesday... 8	— 45. — 54.	29.82 — 29.86
Wednesday 9	— 50. — 62.	29.89 — 30.05

Wind variable, S.W. prevailing.

Generally overcast; rain and snow frequently falling. Rain fallen, 1 inch and 15 of an inch.

The rapid thaw, which we anticipated in our last No., was checked, as may be seen in the above table, by the succeeding frosts till the 7th inst., when the warmth of the day caused the snow suddenly to disappear, and a consequent flood, though not of so serious a nature as was expected. On the 9th the thermometer rose to a height which has not been equalled in the month of February since the year 1806, when, on the 1st day of the same month, it was 64°.

A meteorological inquirer very properly asks, if it be not particularly mild for the season? His request shall be attended to in a future No.

CHARLES H. ADAMS.

Latitude..... 51° 37' 39" N.

Longitude..... 0 3 51 W. of Greenwich.

TO CORRESPONDENTS.

Our promised notice of several medical works is again unavoidably postponed. Account of Fisher's National Portrait Gallery is intended for our next: the Part just published has likenesses and memoirs of Mr. Huskisson, the late Lord Ellenborough, and Sir Edward Codrington.

We purposed to insert the pretty songs from the *Romance of a Day*, with some remarks on the poetry and music; but must also defer this to our next.

T's lines cannot be inserted: their faults, too numerous to be pointed out, forbid it.

S. X's Lines on Death are also declined.

Philo-Natura may differ in opinion from us; but we do think a great poet superior to a man of considerable science.

E. H. will find a packet at our Office.

M. M. the same, after putting us to the trouble of sending a servant to hunt through Kensington on a wrong address. We do not undertake to return MSS., the annoyance and interruption respecting which are insufferable. Every concealed trifler and idle person seem to think that the Editors of a public Journal have nothing to do but to attend to their unreasonable expectations; whereas if they preserved copies of their own performances, there would be no fuss about the dreadful loss. We are certainly obliged to our correspondents; but one may pay too dear even for valued communications.

ERRATA.—In the first page of our last No., col. 2, line 10, for "smile," read "smile."—Drama, p. 91, col. 1, line 3, for "Young," read "Younger," as the actor who performed Henry VI. so well.—Dr. Lardner's paper read at the Royal Society last week was on the *Lunar*, not the *Linnæan* theory.

ADVERTISEMENTS,

Connected with Literature and the Arts.

BRITISH INSTITUTION, Pall Mall.

The Gallery for the Exhibition and Sale of the Works of British Artists is Open Daily, from Ten in the Morning till Five in the Evening.

Admission, 1s.—Catalogue, 1s.

WILLIAM BARNARD, Keeper.

WANTED, by a Young Man who for some

Years has had the Management of a Bookselling and Printing Business, a similar Situation. The most satisfactory References and Security (if required) can be given. Letters (post-paid) addressed C. D. 9, Craig's Court, Charing Cross, London, will be immediately attended to.

ARABIC MANUSCRIPTS.—A Collection

of rare and valuable Arabic Manuscripts, collected by a Gentleman during a residence of many years in Northern Africa, has just been received, and is offered for sale by O. Rich, 12, Red Lion Square, Holborn.

SKETCHES IN ITALY.—Just published,

dedicated, by permission, to his Most Gracious Majesty William the Fourth, the Second Number of a Work which will contain a complete Series of Views in Italy. To be drawn on stone, in the Line or Chalk Manner, by W. Linton, an Engraver of the original Pencil Sketches, drawn from Nature during the Year, in the years 1880 and 1889. He will accompany each view with concise descriptive Observations, and add an Index of References, on verso.

To be completed in Twelve Numbers, each to contain Eight Drawings, 10 inches by 14 inches. The whole work will be printed on the best Imperial drawing paper, 16 folio. Price of each Number, plain, 12s. 12s.; Proofs, on India paper, interleaved, &c. 12s. 12s. 6d.

"This superb and interesting work, from its style and character, is in every respect worthy of the patronage it has obtained. It is facile and efficient, and the artist, we wonder, if any, may be said to enjoy with him the pleasures of his work. It is a publication justly deserving general encouragement and patronage."—*Literary Gazette*, Dec. 1880.

London: Published by W. Linton, 19, Blenheim Street, Great Marlborough Street, to whom Subscribers' Names are to be addressed; by Messrs. Boyd, and Graves, Pall Mall; Colnaghi, Son, and Co. Pall Mall East; and Rodwell, New Bond Street.

Patron, His Majesty.

FLAXMAN'S DESIGNS OF "THE ACTS OF MERCY;" Eight Fac-simile Engravings, by P. C. Lewis.

Price on half-price royal paper, 12s. 12s.; India paper, 12s.; half double elephant, 22s. 2s.; India paper, 12s. 12s. 6d.; extra large Proofs, before the letters, 42s. 42s.; India paper, 52s. 52s. Will be published in a few days, 74, Upper Norton Street, Finsbury Square, by Miss Flaxman and Miss Maria Denman.

Of whom may be had,

All the published Compositions of Mr. Flaxman.

A new edition of the Designs from *Æschylus* in hand, with several additional Plates from Drawings never before engraved.

Jennings's Paris.

Four Views, price 1s. to be completed in Fifty-one Numbers, containing upwards of 800 Views; India Proofs, 2s.

PARIS and its ENVIRONS DISPLAYED,

in a Series of Picturesque Views from original Drawings, then expressly for this Work, under the direction of A. Pugin, Esq. These Engravings executed under the superintendence of St. Charles Henry, with descriptive Letter-press, in English and French.

These are Forty-five Numbers already published, and the whole will be completed within Three Months. The Publishers, with a view to make the work as complete as possible, engaged Mr. Pugin to take views of the recent events in that capital, which will augment the Subscribers for the short delay in publishing the last Number.

Jennings and Chaplin, 63, Chesapeake.

Just completed,

WILD'S ENGLISH CATHEDRALS.

Twelve Select Examples of the Architecture of the Middle Ages in England; comprising Two Views of York Cathedral, interior and exterior (the interior view exhibits the whole of the Choir as it appeared before the Plague); Choir of the Cathedral of Winchester; West Front of Peterborough Cathedral; West Front of Wells Cathedral; the Choir of Norwich Cathedral; Choir of St. George's Chapel, Windsor; Henry the Third's Chapel, Westminster; General View of Salisbury Cathedral; Choir of Gloucester Cathedral.

Carefully etched, aquatinted, and coloured, in imitation of the original Drawings made on the spot, by Charles Wild, Esq. Size of each Plate, delivered in a Portfolio, 10s. 10s.; separate Views, 2s.

Jennings and Chaplin, 63, Chesapeake.

The Landscape Annual for 1880 and 1881.

THE TOURIST IN SWITZERLAND and ITALY, from Drawings by Samuel Prout, Esq. Painter in Vase Colours to His Majesty; and the Literary Department by T. ROSCOE, Esq.

Small is bound in Morocco, each volume containing Twenty-
four Views. A few Copies are left for sale in royal 8vo. India Proof
edition of the Plates, price 12s. 12s. 6d. Price of each Number,
plain, 12s. 12s.; Proofs, on India paper, interleaved, &c. 12s. 12s. 6d.

Small, India paper, without letters..... 4 4
Small, India paper, with letters..... 3 3
Small, Proofs, on India paper, interleaved, &c. 5 5

Jennings and Chaplin, 63, Chesapeake.

The next Volume, being a continuation of the Tour of the Alps, will be from the Drawings of Mr. J. D. Harding, who went to Italy expressly for that purpose.

Sir William Gell's New Work on Pompeii.

THE SUBSCRIBERS TO SIR WILLIAM GELL'S POMPEIANA are respectfully informed, that Part VI. was this day published, containing a beautifully engraved Fac-simile of the Head of Achilles—Venus fishing—View of the Street of the Mercuries—Pedestals in the Forum—Section of the Calidarium—and Two Vignettes, with Thirty-two pages of Letter-press, royal 8vo. proof, 12s. 12s.; imperial 8vo. 12s. 12s.; royal 4to. Proofs, 18s.; India Proofs, with Bindings, limited to Twenty-five Copies, price 12s. 12s. 6d.

Part VII. will be published on the 1st of March; and completed in Twelve Parts.

Jennings and Chaplin, 63, Chesapeake.

Under the Patronage of the King.

MR. HUSKISSON, LORD ELLENBOROUGH (late), and **SIR E. CODRINGTON**—Portraits and Memoirs of these distinguished individuals form the contents of No. XXII. of the National Portrait Gallery. Imperial 8vo. 2s.; ditto, India paper proofs, 5s.; royal 4to. King's edition, India Proof, 7s. 7s. 6d.

As only a few Copies of the King's edition remain unsold, early application is necessary to secure it.

London: Fisher, Son, and Co.; Whittaker and Co.;

and C. Tilt.

ANDREW'S PUBLIC LIBRARY, 167,

New Bond Street.—The chief object with the Proprietor of this Establishment is to insure to his Subscribers an immediate and liberal supply of the New Publications in every Department of English and Foreign Literature. He is aware, from long experience, that an early perusal of the New Works constitutes the great inducement to subscribe to a Public Library; and he feels assured that to his attention to this particular is to be attributed the distinguished patronage he enjoys. A new and enlarged Catalogue is just ready, and will be found replete with all the standard Works in English, French, and Italian, which, with Terms of Subscription, may be had on application at the Library.

BOOKS PUBLISHED THIS DAY.

Natural History.

Just published, with Eighteen Engravings, in demy 8vo. 12s., in royal 8vo. 18s., in royal 8vo. with the Plates accurately coloured, 24s. and in demy 4to. with Proofs on India paper, 42s.; Part XXVII. completing the *Class Reptiles*, &c.

THE ANIMAL KINGDOM, described and arranged in conformity with its Organization, by the Baron Cuvier; translated, with large additional Descriptions of all the Species hitherto named, and of many not before noticed, and with other Original Matter.

By E. GRIFFITH, F.L.S., and others.

The *Class Mammals*, complete in Twelve Parts, with upwards of Two Hundred Engravings, forming Five Volumes, in extra cloth boards, demy 8vo. 72s.; royal 8vo. 102s.; ditto, coloured, 142s.; demy 4to. India Proofs, 142s. A Supplementary Volume, just published, contains an Account of the Fossil Remains. Demy 8vo. 12s. 12s.; royal 8vo. 14s.; demy 4to. 22s. 12s.

The *Class of Birds*, complete in Nine Parts, forming three volumes, in extra cloth boards, demy 8vo. 52s.; royal 8vo. 82s.; ditto, coloured, 102s.; demy 4to. India Proofs, 102s. The *Class of Reptiles*, complete in Three Parts, 1 vol. Demy 8vo. 36s.; royal 8vo. 52s.; ditto, coloured, 82s. 12s.; demy 4to. India Proofs, 82s. 12s.

The *Insects, Fishes, &c.* will follow, the whole comprising about Forty Parts.

It will be so arranged, for the convenience of those who may confine their Zoological Studies to either of the Classes, that each Class will make a distinct work, as well as one of the series of the "Animal Kingdom." The conclusion will contain a tabular view of the system, a copious index, and a general terminology of the science.

The engraved illustrations of this work are in a superior style of execution, by distinguished artists of distinguished eminence. Most of them are from original drawings, made from nature; and several represent species altogether new, or never figured before. Printed for Whittaker, Treacher, and Co. Ave Maria Lane.

Also,

Cuvier's Discourse on the Revolutions of the Surface of the Earth. Translated, with Additions and Illustrations. 8vo. 7s. 6d.

Ostell's General Atlas, with an Index of upwards of Fourteen Thousand Names. In royal 4to. with coloured Outlines, price 18s. half-bound, or with the Maps full coloured, price 22s.

OSTELL'S NEW GENERAL ATLAS;

Including Maps of Canaan or Judea, Ancient Greece, and the Roman Empire. A new edition, on an entirely new Set of Plates, engraved on an enlarged scale, and corrected from the latest and best authorities, containing Thirty Maps.

"To this edition has been added, without any additional charge, a Consulting Index, containing References to every Place laid down in the Maps, with the Latitude and Longitude. The Index, complete upwards of Fourteen Thousand Names, which, in teaching, (besides other obvious uses) must answer almost every purpose of a Gazetteer.

London: Printed for Baldwin and Cradock.

N.B. The same Work on Imperial drawing paper, full coloured, and handsomely half-bound, for Libraries, price 12s. 12s.

On the 1st of February was published, (to be completed in Twelve monthly Parts), price 3s. 6d. No. II. of

MEDICAL ZOOLOGY and MINERALOGY; or, Illustrations and Descriptions of the Animals and Minerals employed in Medicine, and of the Preparations derived from them, &c.

By JOHN STEPHENSON, M.D. F.L.S.

"The plan is to give engraved representations and letter-press descriptions of the various animals and minerals employed for medical purposes; and we have in the first Number plates of the musk, the civet cat, the stag, the sheep, and the beaver. These are the best of the zoographic plates, and the corresponding descriptions are full without being prolix. The work is calculated to encourage a taste for natural history, and we trust it will meet with the support it deserves."—*Medical Gazette*, Jan. 23.

Published by John Wilson, 16, Prince's Street, Bobo.

Where may be had, No. 1.

With Plates and Woodcuts, 8vo. 6s. 6d.

JOURNAL OF THE ROYAL INSTITUTION.

No. II.

Contents.—On a peculiar Class of Optical Deceptions, by Michael Faraday, Esq. F.R.S. &c. &c.—On the Decomposition of the Vegetable Alkaline Salts, by W. T. Brande, Esq. F.R.S. &c. &c.—On the Mode of Ascertaining the Commercial Value of Manganese, by Edward Turner, M.D. F.R.S. &c. &c.—Professor of Chemistry in the London University.—On the Magnetic Curve, by Mark Roget, M.D. Secretary of the Royal Society, &c. &c.—On the Construction of Arches, by M. Lassaulx, Architect to the King of Prussia, communicated by Professor Whewell.—On Volcanism, by Marshall Hall, M.D. &c. &c.—On Stuttering, by the same.—On the Aurora Borealis of the 7th January, 1881, by S. H. Christie, Esq. F.R.S. &c. &c.—On the Permanence of the Magnetism in Steel Bars, by the same.—On the Invention of the Telescope, by Professor Moll, of Utrecht.—On the Rainbow, by Alfred Ainger, Esq.—On the last Eruption of Mount Vesuvius, by Dr. Donati.—On a New Comet, by Professor Dabadie.—On Induced Phosphorescence, by Mr. Thomas Pearsall.—Description of a new Hydraulic Syphon, by Mr. Almond.—With the usual Miscellaneous Scientific Intelligence, &c. &c.

John Murray, Albemarle Street.

THE FOREIGN QUARTERLY

REVIEW, No. XIII. is this day published.

Contents.

Published by Treuttel, Wurtz, and Co., 30, Soho Square; and Black, Young, and Young, 1, Tavistock Street.

Just published, by Henry Colburn and Richard Bentley, New Burlington Street.

THE OFFICIAL KALENDAR for 1881,

In 1 vol. 8vo. neatly bound, price 5s. 6d. With a Supplement comprising all the very important Changes which have recently occurred in the Court of St. James's—in the Army and Navy—in the Imperial Parliament—in the Government of France, &c. A List of the newly elected Sheriffs is likewise given.

By JOHN BURKE, Esq.

II.

The National Library, No. VI. comprising the Second and concluding Volume of the History of the Bible. By the Rev. G. R. Gleig, M.A. &c. In small 8vo. neatly bound and embellished, price 6s.

III.

Life of Sir Humphry Davy, Bart. late President of the Royal Society, &c. &c. By A. J. Paris, M.D. F.R.S. Fellow of the Royal College of Physicians, &c. &c. In 1 vol. with a beautiful Portrait.

IV.

Mothers and Daughters; or, a Tale of the Year 1820. In 3 vols. post 8vo.

V.

The Siamese Twins, a Satirical Tale of the Times. By the Author of "Pelham," "Paul Clifford," &c. In 8vo. with humorous Illustrations.

VI.

The Book of the Seasons; or, the Calendar of Nature. By William Howitt. In small 8vo. with numerous Vignettes, price 10s. 6d.

VII.

The Turf, a Satirical Novel, in 2 vols. small 8vo.

VIII.

Maxwell. By the Author of "Sayings and Doings." In 3 vols. post 8vo.

A new edition, 3 vols. small 8vo. 10s. 6d. half-bound, **BERTHA'S JOURNAL;** comprising a Variety of interesting Information for Young Persons. Arranged for every Day in the Year.

"We have seldom had occasion to notice a work more replete with amusing and diversified information, conveyed in an agreeable style and adapted to juvenile minds. We are much mistaken if many are not allowed to the acquisition of knowledge by a perusal of these volumes. We can recommend the work most earnestly to those who wish to place an interesting book in the hands of youth."—*Astorian*.

"It is with sincere pleasure that we have perused these volumes, which, with all the clearness and accuracy of Mrs. Marcet's justly celebrated conversations, have a familiarity and elementary simplicity about them, that at once qualify them for, we had almost said, the exclusive perusal of more advanced children. No head of a family, we presume, will think of dispensing with this work, at least no one that is anxious to invigorate the minds of his children by communicating to them an early taste for the more valuable and profitable pursuits of the human understanding."—*Monthly Review*.

"Pour les enfants dont l'esprit actif réclame de nouveaux aliments, la Visite de Bertha sera une mine précieuse, où leur curiosité trouvera sans cesse de quoi se satisfaire—on annonce comme devant paraître incessamment une traduction de ce livre."—*Revue Encyclopédique*.

"Of all the little works contrived of late years for the purpose of conveying information to young folks in an attractive manner, this, we think, will prove by far the most successful."—*Monthly Magazine*.

"An admirable production of its class."—*Court Journal*.

"An interesting treatise for young people. The book is extremely cheap, only half-a-guinea for three volumes."—*Spectator*.

"A great variety of information is here pleasantly collected."—*Literary Gazette*.

John Murray, Albemarle Street.

Crown 8vo. 10s. 6d. to match with *Kirk's White's Remains*.
THE LIVES OF UNEDUCATED POETS.
 By ROBERT SOUTHEY, Esq. Poet Laureate.
 To which is added, *Attempts in Verse*, by JOHN JONES, an Old Servant.

Lately published, 8vo. with Illustrations, 31s.
The Pilgrim's Progress, with a Life of John Bunyan, by Robert Southey, Esq.
 John Murray, Albemarle Street.

Containing 5000 Receipts.
 In 1 vol. neatly and closely printed in double columns, comprising upwards of 500 pages, price only 9s. 6d. bound.
THE COOK'S DICTIONARY. A
 New Family Manual of Cookery and Confectionery, on a Plan of ready Reference never hitherto attempted.
 By RICHARD DOLBY,

Of the Thatched House Tavern, St. James's Street.
 "The dictionary plan is novel; you pounce at once, ladies, on the article you want, and settle in half a glance how to have it cooked. Poor Dr. Kitchiner would have run wild, and summoned a new committee of taste, had he thought it possible to present such an improvement in the culinary art."—*Lady's Magazine*.
 Henry Colburn and Richard Bentley, New Burlington Street.

In 2 vols. 8vo. price 11s. 6d. boards, with a Portrait by Dean and a Map.

THE LIFE OF THE RIGHT REV. T. FANSHAU MIDDLETON, D.D. late Lord Bishop of Calcutta.

By the Rev. CHARLES WEBB LE BAS, M.A.
 Professor in the East India College, Hertfordshire, and late Fellow of Trinity College, Cambridge.
 Printed for C., J., G., and P. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

Beautifully printed, and embellished with Frontispiece,

A FIFTH AND SIXTH VOLUME of LORD BYRON'S WORKS, containing Poems not included in any previous Edition, many of them published for the first time,—English Bards, Hints from Horace, Heaven and Earth, Werner, Deformed Transformed, the Island, &c. &c. to match with the Edition of Lord Byron's Works in 4 vols. 18mo. rendering it the first and only complete edition ever printed. (Don Juan alone being published in 2 vols. 8vo.)
 John Murray, Albemarle Street.

In 1 thick vol. third edition, much enlarged and improved, 15s.
MODERN DOMESTIC MEDICINE; or,
 A Popular Treatise, exhibiting the Nature, Symptoms, Causes, and most efficacious Treatment of all Diseases, Containing also a copious Collection of approved Prescriptions, Medical Management of Children, Rules of Diet, Virtues and Doses of all Medicines, &c. The whole forming a clear and comprehensive Medical Guide for the Use of the Family, and Invalids.
 By T. J. GRAHAM, M.D. &c.

"We conscientiously recommend it. It is very far above the celebrated Buchanan's; and we shall preserve the volume as the advice of an invaluable friend, to which we can refer in the hour of need, without any doubt of being benefited by its wisdom."—*Literary Chronicle*.

"In the opinion of a respectable physician, well known in our connexion, it is enriched with much of all that modern practice has ascertained to be valuable, and is not only incomparably superior to Buchanan's, but also to every similar work in our language."—*Wholesale Review*.

"It is one of the very best and most useful books published in modern times."—*Monthly Observer*.

Published by Simpkin and Marshall, London; and sold by all Booksellers.

Also, by the same Author, 8d. edition, revised and enlarged, price 8s. 6d.

2. A Treatise on Indigestion; illustrating the Symptoms, Varieties, Causes, and correct Treatment of the prevailing Disorders of the Stomach and Liver; with Practical Observations on some Painful Complaints originating in those disorders, as Tic Douloureux, Gout, Fulness of Blood in the Head, &c.
 "We sincerely recommend it, and have long been convinced that such a work was imperatively called for."—*London Medical Journal*.

"It is very evidently the result of close attention to, and deep experience in the subject. Mr. Abernethy speaks of it in terms of high praise."—*British Magazine*, Jan. 1820.

In 2 vols. 8vo.
THE ILIAD OF HOMER, translated into English Verse.

By WILLIAM SOUTHEY, Esq.
 "It is evident, from what we have said and quoted, that Mr. Southey has united with a classical closeness of translation, considerable harmony of numbers."—*Edinburgh Review*, July 1830.
 "We must pause here, satisfied that we have submitted enough to justify the anticipations which Mr. Southey is the man to supply a suitable version of Homer to the literature of this country."—*Monthly Review*, No. 58, June 1820.
 John Murray, Albemarle Street.

A cheap edition, being the 3d. small 8vo. 6s.
FINANCIAL REFORM.
 By Sir HENRY PARNELL, Bart.

"The whole of this work has been carefully revised, and several important additions have been introduced, comprising, among others, the following Subjects—the Duties on Coal, Beer, and Sugar—the Corn Laws, Government Manufactures, Collection of the Revenue, French System of Public Accounts, the Civil List, Colonies.

To which are added, Tables of the Civil List Pensions, and of Salaries above 1000l. per annum, complete Index.

"Sir Henry Parnell's admirable work, to which we have more than once directed the attention of our readers."—*Times*.

"It is a rapid survey, clear, ingenious, and diversified."—*Quarterly Review*.

"No book ever appeared on financial topics bearing with it a greater claim to attention than this."—*Westminster Review*.
 John Murray, Albemarle Street.

In 8vo. 12s. cloth boards,
AN INTRODUCTION TO THE NATURAL SYSTEM OF BOTANY; or, a Systematic View of the Organisation, Natural Affinities, and Geographical Distribution of the whole Vegetable Kingdom; together with the Uses of the most important Species in Medicine, the Arts, and Rural or Domestic Economy.

In 3 vols. 8vo.
A SELECTION from the PAPERS of the EARLS of MARCHMONT, illustrative of Events from 1688 to 1750; in the possession of the Right Hon. Sir G. H. Rose.

These volumes contain many original Letters from some of the most celebrated characters of the time; among others, from Lord Bolingbroke, Mr. Pope, Sarah Duchess of Marlborough, Sir William Wyndham, Lord Stair, the great Lord Chesterfield, John Duke of Argyll, Lord Cobham, the Duke of Montrose, &c. &c.

The work throws much light on the following interesting events:—the ill-fated Expedition of the Earl of Argyll; the Landing of William III.;—Battle of the Boyne—Union with Scotland—Rebellion of 1745.—Battle of Falkirk.

REVIEW OF NEW BOOKS.

The Marchmont Papers. By the Right Hon. Sir George Rose, Bart., M.P. 3 vols. 8vo. London, 1831. Murray.

Of all the numerous collections of papers drawn from the archives of great families within our time, we can have little hesitation in saying, that few, if any, deserve to be spoken of more highly than this. From the period of Charles the Second's death, down to the accession of George the Third, the four successive heads of the house of Marchmont occupied a large space in the public eye, not only in Scotland, but in England. Rarely do we find in one individual such virtues, talents, and accomplishments, as distinguished the first of them—the honoured associate and fellow-exile of the heroic Jerviswood. But where else can we point out, in one noble family, a succession of four persons continuing during more than a century the uniform display of high patriotism, high talent, extensive learning, unwearied activity, and unspotted virtue? The extinction of such a house is, indeed, a subject of mournful contemplation.

We are not exactly aware in what the strict intimacy between the last of these earls and the late Mr. George Rose had its origin; but in consequence of that friendship, the papers of the family were inherited by the present Sir George Rose; and this is not the first occasion on which the public has had reason to rejoice in their having fallen into such hands. The very valuable edition of the *real Melville's Memoirs*, lately printed by a club in Edinburgh—a work of the highest interest, hitherto known only by an incomplete and unfaithful translation from good Scotch into bad English—is due entirely to Sir George Rose, who detected and deciphered an original autograph copy among the mass of Marchmont MSS. He has now discharged his duty to the family and the public, by publishing a series of letters and diaries, carrying the history of the earls of Marchmont, and consequently of the general course of public affairs, through the whole of the long period to which we have above alluded. The correspondence includes many most curious letters, never before printed, of the most eminent persons of the last century—for example, of Bolingbroke, Carteret, Swift, Pope (whose friendship to Earl Hugh has been so beautifully immortalised by the poet), of Lord Cobham, Lord Stair, Sir William Wyndham, the great Duke of Marlborough, old Sarah his vixen, and so on; indeed, of all the most remarkable persons who figured in the political world during the times of William, Anne, and the first two Georges, with diaries containing fresh and vivid narratives of the course of parliamentary debates in both houses, and of all the insurrections made on behalf of the Stuart princes in Scotland, the last and greatest included. It is needless for us to attempt doing justice to such a mass of documents: they demand more space and sabler hands.

We have only opportunity to quote a letter or two—opening these volumes almost at ran-

dom, but finding every where most characteristic views connected with *history* and persons well known to *history*.

Sarah Duchess of Marlborough to Hugh Earl of Marchmont.

"March 3d, 1742.

"My lord,—I give you many thanks for the favour of your letter; and it is a pleasure to me to find that you approve of my inclination in choosing a quiet life in the country rather than being at London. As I am of the simpler sex, and fourscore, I am sure I have nothing that can tempt me to change my inclination, since I can be of no use to any body; and though I know some that are very agreeable to converse with, the uncertainty of seeing them, from their own natural calls and my ill health, makes me choose to live as I do, till something unavoidable forces me to Marlborough House, where I cannot avoid many troubles, which very much overbalances the very few that I can hope to converse with. I am glad you had any success in the House of Lords; and as you are a very young man, it may naturally make you hope that things may happen to grow better; but if they do not, it is certainly right to do all in one's power that can contribute to it; but, for my own part, I think if we could get the better of the tyrants and fools that have so near brought this country to ruin, as history gives an account of the thirty tyrants, those that are honest would not be the better for it;—at least it appears so to me by all that has been done by the changes in the last scheme, when the patriots joined with the court. Much the greatest part of England are ignorant and poor; and it must be equal to them who governs. Those that have fortunes worth preserving are such knaves and fools, that to get more they have shewn they will hazard the losing of all; however, I think every man that struggles to oppose what is against both reason and the laws, deserves to be esteemed and praised as highly as even Mr. Pope could do it. I think myself much obliged both to your lordship and to him for having the least thought of coming to see me; but at this time, as the gout, when people are old, does not fix in any one part, which, though very painful, it ends in giving you ease, mine is almost always upon me in some part or other, and gives me a great deal of uneasiness—so much, that I cannot have any pleasure in conversation; and, besides, my family is now in a good deal of disorder by having sick servants; but I think I am in no present danger of death; and when it does come, I hope I shall bear it patiently, though I own I am not arrived at so much philosophy as not to think torturing pain an evil; that is the only thing that I now dread—for death is unavoidable; and I cannot find that any body has yet demonstrated whether it is a good thing or a bad one. Pray do not think me wicked in saying this; and if you talk to Mr. Pope of me, endeavour to keep him my friend; for I do firmly believe the immortality of the soul as much as he does, though I

am not learned enough to have found out what it is; but as I am sure there must be some Great Power that formed this world, that Power will distinguish with rewards and punishments, otherwise the wicked would be happier than the good, the first of which generally gratify all their passions; and those that are most worthy are generally ill treated, and most unhappy. I have tired you a great while with writing upon things that, you know, I cannot possibly understand; but this truth I can assure you, that since I can remember, though I can give no account how it came to be so, I never feared any thing so much as to do the least thing that I imagined could possibly bring any shame upon me; and therefore I hope that for small omissions my punishment will not be severe when I go out of this world; and I think there cannot possibly be a worse place of any long continuance than this is at present. I am, with the greatest esteem and truth imaginable, your lordship's most faithful and obliged humble servant, S. MARLBOROUGH."

We do not remember to have read a more extraordinary epistle than this: but again—from the same to the same:—

"March 15th, 1742.

"My lord,—I have this day had the pleasure of receiving your letter and Mr. Pope's, which gave me a great deal of pleasure, notwithstanding all your jokes upon me. You are pleased to call me the head of the school of philosophy, and very obligingly press me to give you opportunities of improving yourselves. I think you may very well give me that title, since I immediately found out that what you desired of me was reasonable to think would fix me stronger in my opinion, that there was nothing so good for me as retirement; and if I could receive letters from you and Mr. Pope, as you had leisure, I would never come to town as long as I live. In that way of conversing, I should have all the pleasure that I can possibly propose, without the disappointment when Mr. Pope falls asleep,* nor the dread of your taking leave, because you were weary. In this way of conversing I can make the visits as long as I please, by reading them over and over again, and by staying here avoid all that is disagreeable to my temper at London, where I must go in a very little while; and when I am there, I shall see you sometimes, uncertainly, which is not a delightful thing, for I cannot be of the opinion, that expectation makes a blessing dear; I think it seldom or ever pays one for the trouble of it; but I shall always be pleased to see your lordship and Mr. Pope, when you will be so bountiful as to give me any part of your time. In answer to the honour you do me in calling me an oracle, I cannot value myself at all upon thinking, as I did, of some that you

* "The duchess herself at her evening conversations occasionally covered her head with her handkerchief, and was then supposed to be asleep. She was in that state one evening, at a time at which she was much displeased with her grandson, then Mr. John Spencer, for acting, as she conceived, under the influence of Mr. Fox, whose name being mentioned, she exclaimed, 'Is that the fox that stole my goose?'"

were disappointed in, because for a long time I was so well acquainted with them as to know it would end as it did; for when any of my acquaintance has to my own knowledge done a very base thing, or a very foolish one, I never imagine such people are to be relied upon. As for my dear friend Socrates, I believe we have no such men in this country; and yet I am not perfectly satisfied even with him; for I think, being unconcerned at dying was more reasonable at a great age, and being quite weary of the world, which could give him no pleasure, no more than it can me, than for the reasons he gives for not complying with his friends in going out of prison, because he died according to the law. That is just as if I, if I cared to live, should choose to submit to death, when I could escape, because the sentence was given by a majority of robbers, who had broke the laws to condemn me; but, notwithstanding this, I like him better than any of the other philosophers. As for his shewing such spirits as he did in the conversation, after he had taken the poison, I imagine that it was an easy death, that came by degrees; and he could talk, and died much easier than our physicians treat us, when they blister us, and put frying pans upon our heads, after it is demonstration we cannot live. I find you are as ignorant what the soul is as I am. But though none of my philosophers demonstrate plainly that, I do think, there must be rewards and punishments after this life; and I have read lately some of my dear friends the philosophers, that there was an opinion that the soul never died; that it went into some other man or beast. And that seems, in my way of thinking, to be on the side of the argument for the immortality of the soul; and though the philosophers prove nothing to my understanding certain, yet I have a great mind to believe, that kings and first ministers' souls, when they die, go into chimney-sweepers. And their punishment is, that they remember they were great monarchs, were complimented by the parliament upon their great abilities, and thanked for the great honour they did nations in accepting of the crown, at the same time that they endeavoured to starve them, and were not capable of doing them the least service, though they gave him all the money in the nation. This, I think, would be some punishment, though not so much as they deserve, supposing the great persons they had been, and the condition they were reduced to. What gave me this thought of a chimney-sweeper was an accident. My servants, that are very careful of me, were fearful that, having a fire night and day four months together in my chamber, thought* I might be frightened, when I could not rise out of my bed, if the chimney was on fire, and persuaded me to have it swept, which I consented to; and one of the chimney-sweepers was a little boy, a most miserable creature, without shoes, stockings, breeches, or shirt. When it was over, I sent a servant of mine to Windsor with him, to equip this poor creature with what he wanted, which cost very little, not being so well dressed as the last privy seal.† And as I could not be sure the souls of these chimney-sweepers had come from great men, I could not repent of their being so much overpaid as they were. This letter will be as long as a chancery bill; for I have a mind now to tell you, I had a new affront from our great and wise governors. Being quite weary of stewards and bailiffs, and likewise of mortgages, where one must be in

the power of lawyers, which I reckon a very bad thing, I had a mind to lend some money upon the land-tax, thinking that would be easy and safe, at least for a year or two; and as it is free to every body to offer, when a loan is opened in the common way, I applied to lend. Mr. Sandys* refused it, and said, they would not take my money, if he could hinder it; and the reason, I heard from a person of consequence, he gave, was, that I had spoke ill of him. This diverted me; for it is of very little consequence the loss of so much interest, for so short a time as in all probability I could have it. As soon as I have fixed the day for going to Marlborough House, I will give my two scholars notice of it, whom I had rather see than any body there; and am, with the greatest truth, your most obliged and most humble servant,
S. MARLBOROUGH.

We must now vary; though even in Pope we have nothing so striking as these letters of the old duchess.

Mr. Pope to Hugh Earl of Marchmont.

"Sunday Night, Twickenham, Jan. 1746.

"My dear lords,—Yes, I would see you as long as I can see you, and then shut my eyes upon the world, as a thing worth seeing no longer. If your charity would take up a small bird, that is half dead of the frost, and set it a-chirping for half an hour, I will jump into my cage, and put myself into your hands to-morrow, at any hour you send. Two horses will be enough to draw me (and so would two dogs, if you had them); but even the fly upon the chariot-wheel required some bigger animal than itself to set it a-going.

Quadrigit petimus bene vivere

is literally true, when one cannot get into good company without horses; and such is my case. I am faithfully, to you both, a most cordial, entire servant,
A. POPE.†

Mr. Pope to Hugh Earl of Marchmont.

"So it is, and so it always is with me, that I write last to those I love most; and now by this rule you are the man I love the very best: the truth is, I have nothing to tell them, but what they (I flatter myself) know beyond all others, my real sensibility towards them, and my knowledge of their amiable qualities. One must necessarily tell them the same things, if one continues the same affection and esteem; therefore I turn from that honest tautology to some foreign subject; and what more foreign from you than a worthless man of quality, whose death has filled me with philosophy, and contempt of riches? Three hundred thousand pounds the sum total of his life! without one worthy deed, public or private! He had just sense enough to see the bad measures we were engaged in, without the heart to feel for his country, or spirit to oppose what he condemned, as long as a title, or a riband, or a little lucrative employment, could be got by his tame submission and concurrence. He loved nobody, for (they say) he has not left a legacy, not even to his flatterers; he had no ambition, with a vast deal of pride, and no dignity, with great stateliness. His titles only must be his epitaph; and there can be nothing on his monument remarkable, except his nose, which I hope the statutory will do justice to. I should doubly congratulate our victory over the French, if the war would occasion you and me the recovery of our friend to England for ever. Pray how will that matter stand in his regard?

I should be glad, either that your lordship was but half master of Battersea, or I of Twickenham. I was upon the point of writing to him; but will there be a free passage for letters at present? He is a great man, but will never be worth three hundred thousand pounds; yet I would rather regain him, and live with him, three hundred thousand times. My Lord Chesterfield is here, and sends you his services; there is not one man of Bath besides, whom I know. He has made me dine with him *en malade*, though my physician prescribes me garlic, which I choose to take in sauces rather than electuaries. He tells me your lordship is got a-head of all the gardening lords; that you have distanced Lord Burlington and Lord Cobham in the true scientific post; but he is studying after you, and has here lying before him those Thesauruses from which, he affirms, you draw all your knowledge, Miller's Dictionaries; but I informed him better, and told him, your chief lights were from Johannes Serlius, whose books he is now inquiring for of Leake, the bookseller, who has wrote for them to his correspondents. I never was more at ease in my life than in this place; and yet I wish myself with you every other day at least. There are many hours I could be glad to talk to (or rather to hear) the Duchess of Marlborough. So many incidents happen, besides what Providence seems to have any regard to, in the lives and deaths of great men, that the world appears to me to be made for the instruction of the lesser only, and those great ones for our laughter; only I must except, that I hear very good things of the Earl of Bath, which justly entitle him to admiration. I could listen to her with the same veneration and belief in all her doctrines, as the disciples of Socrates gave to the words of their master, or he himself to his demon (for, I think, she too has a devil, whom in civility we will call a genius). I will judge of nothing till I see her. Believe me, my dear lord, your ever obliged, ever affectionate servant,
A. POPE."

"Bath, Tuesday night."

We cannot find room for much extract from the diaries; one little bit, however, we shall quote. It is about the Pelham government, anno Domini 1746. Heaven forbid that we should ever hear such like things said of any government in these enlightened days!

"Wednesday, October 21.

"My brother and I went to the Duke of Newcastle, and dined with Lord Chesterfield, who after dinner talked of Mr. Pitt as one most extravagantly proud, and who meant to distinguish himself as leader of the party of Grenvilles and Lyttleton. We told him what had passed with Mr. Pelham; and he told us Mr. Pelham was in a very distressed state, being obliged to defend measures he disapproved, and forced by his brother to disagreeable things. He said, he did not know where the government lived; that there was none; they met, indeed, and talked, and then said, 'Lord! it is late; when shall we meet to talk over this again?' and that the king was quite insensible, and would do nothing, saying it was their business,—it was all one to him who was to succeed; perhaps one might be as good as the other."

The following is of an earlier date, and a remarkable *mem.* in the hand-writing of Alexander, Earl of Marchmont.

"King William, with his army, perceived King James and his army, before the battle of the Boyne, three days, at last came up with him, and seeing King James his army began

* "So in origin. The sense will be right, if the word thought is omitted."
† "Lord Hervey."

* "Then Chancellor of the Exchequer."
† "This letter is evidently addressed to the Earl of Marchmont and to Lord Beilbrooke, although directed to the former only."

a rising ground, with only the water betwixt them, so near, that one could have [been] known, the king took off his hat, and said, 'Gentlemen, I am glad to see you; if you get away from me now, it shall be my fault;' and then asked Duke Schomberg, if he had his cane-teens there with any thing to eat. They lighted from their horses, and a table-cloth being laid upon the grass, they went to breakfast till the army, which was coming up, should arrive at the camp, that was marked out for it. While at breakfast, a party of the enemy's horse came to the other side of the water, near to where they sat. The king said, we must not be surprised while at breakfast, and ordered a party of one hundred dragoons down to the water-side. The two parties shot at one another all the time of breakfast, which done, they all mounted a horseback again. While this was doing, they observed the enemy bring down two cannon to the plain just below, drawn by grey horses; and as the king and that small company were stepping along viewing the enemy, the first shot from the cannon struck on the Prince of Darmstadt's pistols, so that his horse, a white one, dropped down with his belly to the ground; the king called out, *Ah! le pauvre Prince de Darmstadt est tué!* Immediately after, a second shot hit the king on the shoulder, which made him bend down on his horse's neck, upon which there was a huzza through the enemy's army, believing him to be killed. The ball had just grazed upon his shoulder, tore away his clothes, and scooped out about the breadth of a crown of the flesh of his shoulder. The king stepped on a little further, and then, having bled a good deal, had a handkerchief pushed in under his clothes, to cover the wound till it should be dressed. It was for some time believed by the army that the king was killed; and Earl Selkirk, who was with [the] king, and from whom I had these particulars, galloped to Count Solms, who had been upon the head of the foot, whom he found lying upon his face on the ground, crying and told him the king was well. He would not believe him, till Selkirk asked him if he did not see, who it was that came riding along the line on a black horse; and then the count embraced him in a transport of joy. The count saved the king much, and [was] esteemed by him. The wound kept open above three months, mattered much, and did the king so much good, that he had much better health than usual, and was the reason why his physicians made him put [his] hand into his shoulder after, which did him much good. Providence, if attended to, must be admired and revered. The king, when he was ill used in England, as, to our shame, he often was, said, 'Well! they use me very ill; but my head will be short while under ground, 'till they would be glad to scratch me out again with their nails;' which did not fail to happen often since. He used to say upon those occasions; 'I am a protestant, no more; but if I was popish, I would leave this people to themselves.'

We shall certainly cut more out of these volumes another Saturday. They form a mine of instruction and amusement; and will stand for ever on the same shelf with Pepys, Evelyn, the Colledon Papers, and the tomes of Horace Walpole.

Crotchet Castle. By the Author of "Headlong Hall." 12mo. pp. 300. London, 1831. Hookham.

What we to be asked our private opinion as to who is the wittiest writer in England, we should say, Mr. Peacock. Having, by thus

expressing it, made it also our public one, we are bound to shew cause, which we think we can most satisfactorily do, from the little volume before us. Perhaps no man has seen the follies of his day with a clearer and juster eye than the present author; he investigates, and then reasons; and by placing the fact in its simplest, places it also in its most ridiculous form. He calls things by their right names; and, in this age of high-sounding words and happy epithets, this little process has a most curious effect. Mr. Peacock has a keen perception of the absurd, because he has a clear perception of the truth—

"He is a great observer, and he looks quite through the deeds of men."

by which means he arrives at the motives—and we all know motives are the owls of the mind, which shun daylight. But brief prologue serves for good comedy; and we proceed forthwith to the sense and science, the whims and oddities of Crotchet Castle—the which is the castellated dwelling of a rich and retired citizen, who has a taste for intellectual society, and gives dinners and good wines; thus taking a very rational method of securing it. Under his roof are assembled "Mr. Mac Quedy, the modern Athenian, who lays down the law about every thing, and therefore may be taken to understand every thing. He turns all the affairs of this world into questions of buying and selling. He is the Spirit of the Frozen Ocean to every thing like romance and sentiment: he condenses their volume of steam into a drop of cold water in a moment."

Next is Mr. Skionar, a sort of poetical philosopher, a curious compound of the intense and the mystical. He abominates all the ideas of Mr. Mac Quedy, and settles every thing by sentiment and intuition." Another is Mr. Chainmail, an admirer of chivalry, and one who "holds that the best state of society was that of the twelfth century, when nothing was going forward but fighting, feasting, and praying, which, he says, are the three great purposes for which man was made. He laments bitterly over the inventions of gunpowder, steam, and gas, which he says have ruined the world."

Then there is a musical genius, a geographer, divers other impersonations of the various absurd opinions now afloat, and, though last not least, the Rev. Dr. Follitt, who, we take it, is the incarnation of good sense and a little good living.

And now for a miscellaneous selection of good things. Mr. Crotchet is a Scotchman, whose success in England elicits the following anecdote:—"It is said, that a Scotchman, returning home after some years' residence in England, being asked what he thought of the English, answered: 'They hanna ower muckle sense, but they are an unco' braw people to live amang;' which would be a very good story, if it were not rendered apocryphal by the incredible circumstance of the Scotchman going back."

The arms he adopts are excellent. "He found it essential to his dignity to furnish himself with a coat of arms, which, after the proper ceremonies (payment being the principal), he obtained, videlicet—crest, a crotchet rampant, in a sharp—arms, three empty bladders, turgulent, to shew how opinions are formed; three bags of gold, pendent, to shew why they are maintained; three naked swords, tranchant, to shew how they are administered; and three barbers' blocks, gaspant, to shew how they are swallowed."

So is his reason for widowhood. "Mr. Crotchet was left a widower, with two children; and, after the death of his wife, so strong

was his sense of the blessed comfort she had been to him, that he determined never to give any other woman an opportunity of obliterating the happy recollection."

He settles at Crotchet Castle. "With his rustic neighbours he was, of course, immediately and necessarily a squire—Squire Crotchet of the castle; and he seemed to himself to settle down as naturally into an English country gentleman, as if his parentage had been as innocent of both Scotland and Jerusalem as his education was of Rome and Athens. But as, though you expel nature with a pitchfork, she will yet always come back, he could not become, like a true-born English squire, part and parcel of the barley-giving earth—he could not find in game-bagging, poacher-shooting, trespasser-pounding, footpath-stopping, common-enclosing, rack-renting, and all the other liberal pursuits and pastimes which make a country gentleman an ornament to the world, and a blessing to the poor—he could not find in these valuable and amiable occupations, and in a corresponding range of ideas, nearly commensurate with that of the great King Nebuchadnezzar, when he was turned out to grass—he could not find in this great variety of useful action, and vast field of comprehensive thought, modes of filling up his time that accorded with his Caledonian instinct. The inborn love of disputation, which the excitements and engagements of a life of business had smothered, burst forth through the calmer surface of a rural life. He grew as fain as Captain Jamy, 'to hear some argument betwixt ory tway;' and being very hospitable in his establishment, and liberal in his invitations, a numerous detachment from the advanced guard of the 'march of intellect,' often marched down to Crotchet Castle."

We humbly submit the following passages to the present Lord Chancellor's consideration, being sure that he, who can use a giant's strength in flagellating others, will enjoy these palpable hits at himself:—

"God bless my soul, sir!" exclaimed the Rev. Dr. Follitt, bursting, one fine May morning, into the breakfast-room at Crotchet Castle; 'I am out of all patience with this march of mind. Here has my house been nearly burnt down, by my cook taking it into her head to study hydrostatics, in a sixpenny tract, published by the Steam Intellect Society, and written by a learned friend, who is for doing all the world's business as well as his own, and is equally well qualified to handle every branch of human knowledge. I have a great abomination of this learned friend—as author, lawyer, and politician, he is *triformis*, like Hecate; and in every one of his three forms he is *biformis*, like Janus—the true Mr. Facing-both-ways of Vanity Fair. My cook must read his rubbish in bed; and as might naturally be expected, she dropped suddenly fast asleep, overturned the candle, and set the curtains in a blaze. Luckily, the footman went into the room at the moment, in time to tear down the curtains and throw them on her night-cap extinguished her wick.—*Lord Bossnott*. But, sir, by the by, how came your footman to be going into your cook's room? It was very providential, to be sure, but—*Dr. Follitt*. Sir, as good came of it, I shut my eyes, and asked no questions. I suppose he was going to study hydrostatics, and he found himself under the necessity of practising hydraulics.—*Mr. Firedamp*. Sir, you seem to make very light of science.—*Dr. Follitt*. Yes, sir, such science as the learned friend deals in—every thing for every body, science for all, schools for

all, rhetoric for all, law for all, physic for all, words for all, and sense for none. I say, sir, law for lawyers, and cookery for cooks; and I wish the learned friend, for all his life, a cook that will pass her time in studying his works; then every dinner he sits down to at home, he will sit on the stool of repentance.—*Lord Bosn owl*. Now, really that would be too severe: my cook should read nothing but Ude.—*Dr. Foll iott*. No, sir! let Ude and the learned friend sing fowls together; let both await from my kitchen. *Θύρας δ' ἐκείνου βιβλίους*. Ude says an elegant supper may be given with sandwiches. *Horresco referens*. An elegant supper! *Di meliora pias!* No Ude for me. Conviviality went out with punch and suppers. I cherish their memory. I sup when I can, but not upon sandwiches. To offer me a sandwich, when I am looking for a supper, is to add insult to injury. Let the learned friend and the modern Athenians sup upon sandwiches."

In a conversation of later date.—*Dr. Foll iott*. Well, Mr. Mac Quedy, it is now some weeks since we have met: how goes on the march of mind?—*Mr. Mac Quedy*. Nay, sir, I think you may see that with your own eyes.—*Dr. Foll iott*. Sir, I have seen it, much to my discomfiture. It has marched into my rick-yard, and set my stacks on fire, with chemical materials, most scientifically compounded. It has marched up to the door of my vicarage, a hundred and fifty strong; ordered me to surrender half my tithes, consumed all the provisions I had provided for my audit feast, and drank up my old October. It has marched in through my back-parlour shutters, and out again with my silver spoons, in the dead of the night. The policeman who has been down to examine, says my house has been broken open on the most scientific principles. All this comes of education.—*Mr. Mac Quedy*. I rather think it comes of poverty.—*Dr. Foll iott*. No, sir. Robbery, perhaps, comes of poverty; but scientific principles of robbery come of education. I suppose the learned friend has written a sixpenny treatise on mechanics, and the rascals who robbed me have been reading it.—*Mr. Crotchet*. Your house would have been very safe, doctor, if they had had no better science than the learned friend's to work with.—*Dr. Foll iott*. Well, sir, that may be. The Lord deliver me from the learned friend!—*Mr. Crotchet*. Well, doctor, for your comfort, here is a declaration of the learned friend's that he will never take office.—*Dr. Foll iott*. Then, sir, he will be in office next week."

The week elapses. "Mr. Crotchet told the Rev. Dr. Foll iott the news of the morning. 'As you predicted,' he said, 'your friend, the learned friend, is in office; he has also a title—he is now Sir Guy de Vaux!'—*Dr. Foll iott*. Thank heaven for that! he is disarmed from further mischief. It is something, at any rate, to have that hollow and wind-shaken reed rooted up for ever from the field of public delusion.—*Mr. Crotchet*. I suppose, doctor, you do not like to see a great reformer in office; you are afraid for your vested interests.—*Dr. Foll iott*. Not I, indeed, sir; my vested interests are very safe from all such reformers as the learned friend. I vaticinate what will be the upshot of all his schemes of reform. He will make a speech of seven hours' duration, and this will be its quintessence—that, seeing the exceeding difficulty of putting salt on the bird's tail, it will be expedient to consider the best method of throwing dust in the bird's eyes. All the rest will be

Τὴν ἐν τῇ ἐκείνῃ.
Ποταμὸν, ποταμὸν.

Τὴν ἐν τῇ ἐκείνῃ.
Κίκαβαδὺ, κίκαβαδὺ.

Τοσοῦτον τοσοῦτον ἀλλήλῃ.

as Aristophanes has it; and so I leave him, in Nephelococcygia."†

The discussion between Dr. Foll iott and Mr. Mac Quedy is very amusing.

"*Dr. Foll iott*. Sir, I say every nation has some eximious virtue; and your country is pre-eminent in the glory of fish for breakfast. We have much to learn from you in that line, at any rate.—*Mr. Mac Quedy*. And in many others, sir, I believe. Morals and metaphysics, politics and political economy, the way to make the most of all the modifications of smoke; steam, gas, and paper currency; you have all these to learn from us; in short, all the arts and sciences. We are the modern Athenians.—*Dr. Foll iott*. I, for one, sir, am content to learn nothing from you but the art and science of fish for breakfast. Be content, sir, to rival the Boeotians, whose redeeming virtue was in fish, touching which point you may consult Aristophanes and his scholiast in the passage of Lysistrata, *ἀλλ' ἐπὶ τὰς ἰχθυίας*, and leave the name of Athenians to those who have a sense of the beautiful, and a perception of metrical quantity.—*Mr. Mac Quedy*. Then, sir, I presume you set no value on the right principles of rent, profit, wages, and currency?—*Dr. Foll iott*. My principles, sir, in these things are, to take as much as I can get, and to pay no more than I can help. These are every man's principles, whether they be the right principles or no. There, sir, is political economy in a nut-shell.

"*Mr. Mac Quedy*. A literary supper in sweet Edinbroo' would cure you of the prejudice you seem to cherish against us.—*Dr. Foll iott*. Well, sir, well; there is cogency in a good supper; a good supper in these degenerate days bespeaks a good man; but much more is wanted to make up an Athenian. Athenians, indeed! where is your theatre? who among you has written a comedy? where is your attic salt? which of you can tell who was Jupiter's great grandfather? or what metres will successively remain, if you take off the three first syllables, one by one, from a pure antispastic acatalectic tetrameter? Now, sir, there are three questions for you; theatrical, mythological, and metrical; to every one of which an Athenian would give an answer that would lay me prostrate in my own nothingness.—*Mr. Mac Quedy*. Well, sir, as to your metre and your mythology, they may e'en wait a wee. For your comedy, there is the Gentle Shepherd of the divine Allan Ramsay.—*Dr. Foll iott*. The Gentle Shepherd! It is just as much a comedy as the book of Job.—*Mr. Mac Quedy*. Well, sir, if none of us have written a comedy, I cannot see that it is any such great matter, any more than I can conjecture what business a man can have at this time of day with Jupiter's great grandfather.—*Dr. Foll iott*. The great business is, sir, that you call yourselves Athenians, while you know nothing that the Athenians thought worth knowing, and dare not shew your noses before the civilised world in the practice of any one art in which they were excellent. Modern Athens, sir! the assumption is a personal affront to every man who has a Sophocles in his library. I will thank you for an anchovy."

* "Sounds without meaning—imitative of the voices of birds.—From the *Ὀρνίθες* of Aristophanes."
† "Cuckoo-city-in-the-clouds"—From the same comedy.

Definition of laughter:—

"*Lord Bosn owl*. I hope, if I am to be of the party, our ship is not to be the ship of fools: He! he! he!—*Dr. Foll iott*. If you are one of the party, sir, it most assuredly will not: Ha! ha!—*Lord Bosn owl*. Pray, sir, what do you mean by Ha! ha! he!—*Dr. Foll iott*. Precisely, sir, what you mean by He! he!—*Mr. Mac Quedy*. You need not dispute about terms; they are two modes of expressing merriment, with or without reason; reason being in no way essential to mirth. No man should ask another why he laughs, or at what, seeing that he does not always know, and that, if he does, he is not a responsible agent. Laughter is an involuntary action of certain muscles, developed in the human species by the progress of civilisation. The savage never laughs.—*Dr. Foll iott*. No, sir, he has nothing to laugh at. Give him Modern Athens, the 'learned friend,' and the Steam Intellect Society. They will develop his muscles."

Cause of liking society:—

Lord Bosn owl at any time preferred "any company to his own. He thought it very singular that so agreeable a person as he held himself to be to others should be so exceedingly tiresome to himself: he did not attempt to investigate the cause of this phenomenon, but was contented with acting on his knowledge of the fact, and giving himself as little of his own private society as possible."

Two short, but true passages:—

"Decent families; ay, decent is the distinction from respectable. Respectable means rich, and decent means poor. I should die if I heard my family called decent. And then your decent family always lives in a snug little place: I hate a little place; I like large rooms and large looking-glasses, and large parties, and a fine large butler, with a tinge of smooth red in his face; an outward and visible sign that the family he serves is respectable; if not noble, highly respectable.

"It is so rare too, in these days of smooth manners, to see any thing like natural expression in a man's face. There is one set form for every man's face in female society: a sort of serious comedy, walking gentleman's face: but the moment the creature falls in love, he begins to give himself airs, and plays off all the varieties of his physiognomy, from the Master Slender to the Petruchio; and then he is actually very amusing."

We must be content to close for the present with one or two of the clever ballads.

Llyn-y-Dreiddiad-Fraud: the Pool of the Diving Friar.

"Gwenwynwyn withdrew from the feasts of his hall: He slept very little, he prayed not at all: He pondered, and wandered, and studied alone; And sought, night and day, the philosopher's stone. He found it at length, and he made its first proof By turning to gold all the lead of his roof: Then he bought some magnanimous heroes, all fire, Who lived but to smite, and be smitten for hire. With these, on the plains like a torrent he broke: He filled the whole country with flame and with smoke. He killed all the swine, and he broached all the wive: He drove off the sheep, and the heaves, and the kine: He took castles and towns; he cut short limbs and lives. He made orphans and widows of children and wives: This course many years he triumphantly ran, And did mischief enough to be called a great man. When, at last, he had gained all for which he had striven, He bethought him of buying a passport to heaven: Good and great as he was, yet he did not well know, How soon, or which way, his great spirit might go. He sought the grey friars, who, beside a wild stream, Reflected their frames on a primitive scheme: The gravest and wisest Gwenwynwyn found out, All lonely and ghostly, and angling for trout. Below the white dash of a mighty cascade, Where a pool of the stream a deep resting-place made, And rock-rooted oaks stretched their branches on high, The friar stood musing, and throwing his fly.

To him said Gwennwynwyn: 'Hold, father, here's store,
For the good of the church, and the good of the poor!'
Then he gave him the stone; but, ere more he could speak,
Wrath came on the friar, so holy and meek:

He had stretched forth his hand to receive the red gold,
And he thought himself mocked by Gwennwynwyn the
Bold;

And in scorn of the gift, and in rage at the giver,
He jerked it immediately into the river.

Gwennwynwyn, aghast, not a syllable spoke;
The philosopher's stone made a duck and a drake:
Two systems of circles a moment were seen,
And the stream smoothed them off, as they never had been.

Gwennwynwyn regained, and uplifted his voice:
'Oh, friar, grey friar, full rash was thy choice;
The stone, the good stone, which away thou hast thrown,
Was the stone of all stones, the philosopher's stone!'

The friar looked pale, when his error he knew;
The friar looked red, and the friar looked blue;
And heels over head, from the point of a rock,
He plunged, without stopping to pull off his frock.

He dived very deep, but he dived all in vain,
The prize he had alighted he found not again:
Many times did the friar his diving renew,
And deeper and deeper the river still grew.

Gwennwynwyn gazed long, of his senses in doubt,
To see the grey friar a diver so stout:
Then sadly and slowly his castle he sought,
And left the friar diving, like dabbich distraught.

Gwennwynwyn fell sick with alarm and despite,
Died, and went to the devil, the very same night:
The magnanimous hero he held in his pay,
Seized his castle, and marched with the plunder away.

No knell on the silence of midnight was rolled,
For the flight of the soul of Gwennwynwyn the Bold:
The brethren, unfeeling, let the mighty ghost pass,
Without praying a prayer or intoning a mass.

The friar haunted ever beside the dark stream;
The philosopher's stone was his thought and his dream;
And day after day, ever head under heels,
He dived all the time he could spare from his meals.

He dived, and he dived, to the end of his days,
As the peasants oft witnessed with fear and amaze:
The mad friar's diving-place long was their theme,
And no plummet can fathom that pool of the stream.

And still, when light clouds on the midnight winds ride,
If by moonlight you stray on the lone river-side,
The ghost of the friar may be seen diving there,
With head in the water, and heels in the air.*

The Priest and the Mulberry Tree.

"Did you hear of the curate who mounted his mare,
And merrily trotted along to the fair?

Of creature more tractable none ever heard;
In the height of her speed she would stop at a word,
And again with a word, when the curate said Hey,
She put forth her mettle, and galloped away.

As near to the gates of the city he rode,
While the sun of September all brilliantly glowed,
The good priest discovered, with eyes of desire,
A mulberry tree in a hedge of wild briar,
On boughs long and lofty, in many a green shoot,
Hung large, black, and glossy, the beautiful fruit.

The curate was hungry, and thirsty to boot;
He shrunk from the thorns, though he longed for the
fruit:

With a word he arrested his courser's keen speed,
And he stood up erect on the back of his steed;
On the saddle he stood, while the creature stood still,
And he gathered the fruit, till he took his good fill.

'Sure never,' he thought, 'was a creature so rare,
So docile, so true, as my excellent mare,
Lo, here, how I stand! (and he gazed all around)
'As safe and as steady as if on the ground,
Yet how had it been if some traveller this way
Had, dreaming no mischief, but chanced to cry Hey?'

He stood with his head in the mulberry tree,
And he spoke out aloud in his fond reverie:
At the sound of the word, the good mare made a push,
And down went the priest in the wild-briar bush.
He remembered too late, on his thorny green bed,
Much that well may be thought cannot wisely be said."

The Assassins of the Paradise: an oriental Tale; in four Cantos. By the Author of "Abbasah." 8vo. pp. 104. London, 1831. E. Ball.

THERE is a great deal of talent in this little volume. The narrative is founded on an account of the most extraordinary anomaly that history presents—an organised government whose avowed principle was secret murder; and who, using adroitly those two powerful engines of superstition, terror and pleasure, attained a degree of influence which the greatest monarchs were glad to propitiate by tribute. As we believe many of our readers are acquainted with this singular people, with reference to the single chief whose assassination of

Conrade of Montserrat was made one of the charges against Richard Cœur de Lion, we extract our present author's account, which condenses much information with all possible brevity and clearness.

"The name of Assassin, originally Haschischin, belonged to that sect of fanatical mystics who, about A.D. 1090,* established themselves in the ranges of Elborz or Caucasus, fabled as the prison of the evil genii, and girdle of the world. Hence, though detested and feared for their strange and sanguinary doctrines, the Assassins, who affected a spiritual rather than temporal sway, spread rapidly over the whole tract called by the Persians Kohestan, in Arabic El Jebel, or the Mountainous. The principal residence of the Shaik-El Jebel, or Ancient of the Mountains, was in that part of Caucasus nearly north of Kaswin, from its loftiest point, Mount Demavend, on the east, to where the river Sharood falls into the rapid torrent of the Kizil Ozein, or Golden Stream. Alamut, or the Vulture's Nest, a fortress whose ruins are still visible from the plain, was the seat of the court, and guarded the entrance of a beautiful valley, the Irem, or earthly paradise of the Assassins. The garden of Irem was laid out according to the Moslem ideas of paradise, with fragrant and flowering shrubs and fruit-trees from every climate. Pavilions of marble, ornamented with gold, and adorned with paintings and silken furniture; streams of crystal watered the soil; fountains of milk and wine, or more probably coloured water, played in recesses; beautiful women, obtained indifferently by purchase or violence, and trained in every elegant and seductive allurements, personated the Houri brides reserved for the faithful, and amidst the warbling of birds and the sounds of stringed instruments, filled the air with songs of love and languishment. Such was the bower of bliss designed to confirm the proselytes of the order in their new faith. They were thrown into deep slumber by a preparation of the wild hemp, or haschisch—the root of their name—and waked in the garden to the free enjoyment of its delights. After a short time, they were carried out as they had entered, and remained ever after firmly convinced of the Shaik's divine pretensions, devoting themselves to his person and mandates as to the visible deity. The creed of this sect was founded on that of Mahomed, but tinctured with atheism, in which it finally merged. The shaik or imam affected, like the great prophet of the East, the power of introducing his followers into paradise: and he farther inculcated the transfusion of the perfect soul into the person of the reigning imam,—a doctrine found, with some modifications, every where in the East. The proselytes of all countries, Europe not excepted, were from twelve to twenty years of age; they were divided into civil and military classes. The former, instructed in languages and arts, rose to the highest dignities; while from the latter were chosen, on occasion, the ready instruments of their superior's will. Singly, or in bands, they filled the whole country with outrage, robbery, and murder. All who gave umbrage to their chief were doomed to death; merchants, princes, priests, and even the caliphs of Bagdad and Egypt fell beneath their weapons, which assailed the lives of European leaders during the Crusades, and penetrated even to the court of the King of France. At length they were extirpated by the Tartar General Holagou, in 1070.* A remnant of the Syrian colony of this

* There is obviously a typographical error in these dates. The latter date should be about 1260; for although

race still exists under Turkish protection, near Lebanon, and is now remarkable only for hospitality to strangers. Of the original Persian stock, an imam resides at Koom, tributary to the shah, and supported by voluntary contributions from his followers, who extend as far as India."

The hero of this poem is one of these neophytes; and his character is sketched with a degree of force and truth which makes us give the writer much credit for his skill in mental analysis. Some of his descriptions are very fine. We like the least those of the paradise itself. Moore is too recent in our memories not to be a dangerous rival to any one who ventures on his own enchanted ground. We quote a fine passage of a storm.

"The soft, green hue of evening's latest ray
In gradual twilight faded slow away;
Hushed into sullen calm the breeze's sigh,
The lazy cloud slept heavily on high
Involved and veiling in the aerial haze
That, scarce apparent, steals upon the gaze,
Dimming the thickened view, till one by one
Each form so fair, so beautiful, is gone;
And cheats with largening mists the filmy sight,
Till the lulled sense awakes, and all is night.

Dark closed that night: the clouds portentous spread
In murky darkness round each mountain-head:
A floating sea of gloom, whose billows wide
Sank in slow volumes down their steepy side,
And midway pausing, o'er the plain below
Hung shadowing forth fantastic shapes of woe.

"Far to the south a train of pallid light
Shed o'er the sullen heaven its dusky white,
Where midst faint, few, pale gleams that edged its bound
Slept the dark thunder in the depth profound:
Loading the labouring air it onward came,
Glancing o'er moveless clouds thin sheets of flame,
And fearful, frowning, huge, appeared to scan
The cowering scene, to pour its wrath on man.

"More dull and deep the thickening stillness grew;
Near and more near the lowering tempest drew,
Concentered, silent, gathering for the worst,
Till in one mighty sweep its vengeance burst:
Clove the wide heaven that opening flash of flame;
Loud rending rocking earth the thunder came,
One rolling, wildering, wandering crash of sound,
From bowelling caves reverberated round,
Peal burying peal, involved, but urging more
That long, wide, wild, intolerable roar
Rung through rock, cavern, crag: the echoing ear
Stunned in the whirl, yet still compelled to hear!
Descending showers in rushing torrents streamed,
Where mimic lights from hurrying foam-bells gleamed,
Down, down their channelled course impetuous driven,
As life's frail bubbles at the voice of Heaven."

Our next extract is where human feeling mingles with the scene.

"Hast thou not felt when, to its cell confined,
Lethan slumber long hath held the mind,—
When listless, joyless, moveless, scarce alive,
Pent down by circumstance, it scorn'd to strive,
But in its own dark coil obscurely cur'd
Kept lonely state, regardless of the world:
And deem'd in stern misanthropy the aim
That each aspires to but a juggling game;
A crowded fair of fools—a paltry jest,
Degrading him who mingles with the rest?—
Hast thou not felt,—when thus thy pulse has lain
Stagnate and dull, and hope has been in vain,
If some charm'd claim—some call of joy or strife
Wooded to enjoy, or stung thee into life:
The spirits leap?—the boiling blood-tide dart
In fierce revulsion to thy bounding heart?—
Thou thought, wish, and hope, aim, impulse, feeling, dream,
O'erflood the soul in one tumultuous stream?
That first, wild rush of chaos to its place?—
Each pulse, each passion rocking to the base,
And all the kindled energies uprise—
A hundred hands to grapple with the skies?
The mountain-barriers, bounding meander scope,
But mightier weapons for thy giant-hope:
And heights by slothful ease unsought, unknown,
Now heap'd on heights to make the heavens thine own?
So, from oblivion call'd by that late chance,
So waken'd Halib from his weary trance:
That sluggish calm where life would fondly lie
A crowded dream beneath a burning sky,
Listless of thought—and sick with phantasy!
Still, that first transport o'er, the balm it brought
Gave renovated energies to thought,

historians generally place the extinction of the Assassins in 1256; yet, notwithstanding their power was crushed and their strongholds reduced by Holagou at that period, they were not finally extirpated till three years afterwards. A fact not generally known.

Though yet remain'd to urge his waking hour
Some trace of its intoxicating power.
Roused, even to sternest mood, he yet resign'd
To that fantastic influence all the mind:
His eager spirit watch'd with fierce delight
And loved the terrors of that angry night;
He deem'd that strife a scene for him alone;
Those glories blaz'd in earnest of his own;
To his excited breast the tempest's voice
But pour'd a louder summons to rejoice."

We ourselves doubt whether poets now
have not fallen "on evil days;" but if the
times are evil, much of this poem is good.

MEDICAL WORKS.

1. *Cases illustrative of the Efficacy of various Medicines, administered by Inhalation, in Pulmonary Consumption, in Asthma, &c. &c.* By Sir C. Scudamore, M.D., F.R.S., &c. &c. 8vo. pp. 113. London, 1830. Longman and Co.
2. *A Dissertation on the Influence of Heat and Humidity; with practical Observations on the Inhalation of Iodine and various Vapours, in Consumption, &c.* By James Murray, M.D., &c. 8vo. pp. 323. London, 1829. Longman and Co.
3. *Two Memoirs on the successful Inhalation of diluted Chlorine in the early stages of Pulmonary Consumption.* Translated from the French of M. Gannal, by W. H. Potter. 8vo. pp. 94. London, 1831. Callow and Wilson.
4. *Remarks on a new and important Remedy in Consumptive Diseases, &c.; with Description of an Apparatus, &c.* By J. D. Humphreys, Surgeon. Pp. 50. London, 1831. W. Kidd.
5. *On the recent Improvements in the Art of distinguishing the various Diseases of the Heart.* By John Elliotson, M.D., Cantab. F.R.S. Longman and Co.
6. *A popular and impartial Estimate of the present Value of Vaccination, &c.* By S. Plumbe, M.R.C.S. 8vo. pp. 99. London, 1830. Cadell.
7. *Medico-Chirurgical Transactions, Vol. XVI.* London, 1830. Longman and Co.
8. *Dr. A. T. Thomson's Introductory Lecture on Medical Jurisprudence, delivered in the University of London, January 7, 1831, &c. &c.* 8vo. pp. 31. London, 1831. J. Taylor.

ALTHOUGH we are not in the habit of paying such undivided attention to medical publications as to those of general literature, still the importance of the inquiries often tempts us to their discussion; and the accumulation of works of this description at present upon our table, seems to demand something of that periodical notice in which our plan and limits allow us to indulge. Sir C. Scudamore's, Dr. Murray's, and the next two smaller volumes, are proofs of the growing importance attached to the theory of inhalation as a remedy for consumption; and Italy and France are filled with publications of the same tendency. It is, indeed, of prodigious consequence, that such medicaments should not be ignorantly applied; and whenever we have touched on this subject (for example, in the case of Mr. St. John Long),* all

* We have just received the second edition of the volume published by Mr. Long, containing not only a view of his discoveries in the healing art, but an overwhelming body of evidence to the extraordinary cures he has performed, and some able remarks on the trial to which he was subjected by the death of Miss Cashin. An additional public interest attaches at present to this statement, on account of the approaching trial of this individual on another charge of manslaughter; and though we cannot enter upon a case which will so soon occupy acute and wise legal heads, we should be deserting a man in distress if we did not protest against the industry and virulence with which it has been attempted to poison all the fountains of justice against him. That one whom the press has been so systematically and generally employed to hunt down as an impostor and a murderer, can

that we have advocated is its fair, free, and ample investigation,—not its irrational condemnation at once, without inquiry, and from exasperated feelings or individual prejudices. To promote this, we now proceed to the volumes before us. With regard to the first: the author, having already presented to the profession and to the public several valuable works, on different subjects of medical science, has here, in our opinion, given an additional proof of his industry and indefatigable spirit of research, by the production of a treatise on topics, as we have said, of the highest importance, under the unassuming title of *Cases*, illustrative of what may justly be termed new and successful modes of treating the most formidable morbid affections of the respiratory organs. At the head of these is placed the vitally interesting subject, "pulmonary consumption,"—a disease, unfortunately, not only sometimes hereditary, but diffusely prevalent; often selecting for its victims the most beautiful objects in the creation, and so relentless in its nature, that, when once fully formed, it has hitherto bid defiance, with few exceptions, to every method of treatment that the skill and ingenuity of the physician have been able to devise. We hail, therefore, with no common feelings of satisfaction, a communication which holds out well-grounded hopes, that this stigma of physic, this destroyer of thousands—usually, too, at the ripening, most attractive, and promising period of human existence, when the mental and physical powers are alike becoming developed—may henceforth be erased from the list of incurables, and be susceptible of relief, nay, even of cure, by the means suggested, if had recourse to at an early stage of the disease, before the structure of the lungs has sustained irreparable injury and disorganisation.

Were so great a desideratum attainable, at the expense even of temporary suffering and inconvenience, the afflicted would still gladly avail himself of a plan which encouraged the hope of eventual benefit. What, then, must be the gratitude of the patient, and how highly must he appreciate the treatment proposed, when he learns, that the object in view can be realised without pain or danger; and that the measures recommended are productive of immediate comfort and sensible alleviation, while the curative process is going on!

The process in question consists principally in administering, by the medium of watery vapour, the active principles of medicines of approved virtue. And who but must be satisfied of the superior efficacy of what may not inaptly be called the local and surgical treatment of disease, by the application of appropriate remedies at the very seat of the ailment, to the administration of even the most proper agents through the circuitous route of the stomach and circulating system, by which medium of transmission the greatest alterations in their composition may be reasonably anticipated—mixed and agitated as they must be with the vital fluids before they can reach the place of their destination? This has always appeared to us the most natural, and, as it has been now proved to be the most direct, mode of assailing (by inspiring, as it were, the means of relief

have a really fair trial, is impossible. It is true that we have of late observed a sort of re-action in this tremendous engine upon public opinion—a sort of sense of the cruel unfairness of prejudging an accused person, obnoxious to many members of a very powerful body; but, withal, it cannot be expected that prejudices so deeply rooted can be so easily effaced. Of the cause at issue, we say nothing—the laws have been appealed to, and the laws must decide: our objection is to the violation of the Christian and constitutional rule of presuming innocence till guilt has been proven.

with the breath), the several morbid affections of the organs of respiration, comprehending the trachea or windpipe, and its continuous passages or tubes, reaching and pervading, by innumerable ramifications, the air-cells of any part of the lungs; which, in fact, are scarcely accessible through any other channel.

There is, however, a necessity for the greatest caution and judgment in the adoption of a practice apparently so simple, that the least informed may fancy himself competent to its management and control; whereas, from the whole tenour of the work under consideration, it is manifest that no ordinary share of discrimination is indispensable for the successful employment of the process. We are sorry Sir C. S. has not, however, given us the formula.

With this remark we shall conclude our brief and general review of a work which displays, on the part of its author, a minute and intimate acquaintance with his subject; and who, in modestly setting forth the advantages of a novel and ingenious practice, has avoided the too general custom of exhibiting only the favourable side of the question. Every sentence breathes a spirit of candour and liberality, equally removed from selfish views and boasting empiricism. We presume, therefore, that the profession will eagerly read this valuable tract, for their personal gratification and instruction; and the afflicted will require no further temptation to peruse it, than the comfortable assurance that by so doing they will derive the greatest consolation and encouragement, from the prospect of obtaining relief in their distressing and dangerous diseases.

Without going into the number of interesting inquiries embraced by Dr. Murray's work, such as a theory of animal temperature, remarks on diet, &c., we may observe, that he stands first as the proposer of iodine, that elegant preparation of marine alkali, as a medicine, which will sometimes, by inhalation, heal the diseases we have particularised, if early applied; and at all events afford rest, repose, and relief, where cure is impossible. We think there is every reason to infer, that the benefit which persons afflicted with pulmonary complaints usually experience from a seaside residence is to be ascribed to the vapour of iodine disseminated through the atmosphere. The odour is very perceptible to the olfactory nerves on a hot summer day on walking over a mass of fuci or sea-kelp, while the peculiar exhilarating results may fairly be traced to this source.

M. Gannal is the advocate for diluted chlorine—the powerful agent (in the gaseous form) in arresting the progress of animal putrefaction; whence he maintains its merit (in a liquid form—the gas being too irritating) as a means of arresting purulent secretion in the lungs. In point of fact, the discovery to which M. Gannal lays claim is, first, that of applying chlorine gas in a pure state, instead of obtaining it from its alkaline or earthy compounds; and, secondly, that of greatly diluting it with aqueous vapour, and using it at a temperature very nearly equal to that of the blood; by which means it is of course less liable to produce irritation. We have taken the trouble to examine the apparatus, at the shop of Mr. Hooper, the translator of M. Gannal's work. It is exceedingly simple, and, under judicious management, we do not doubt but the application of chlorine may also prove a valuable remedy in the earlier stages of phthisis, but more especially in the chronic class of pulmonary diseases. A very fair report of cases in which the new agent has been applied is given by the

author; and the translator appears to have executed his task with fidelity.

Mr. Humphreys (the great-grandson of Dr. Doddridge, and the editor of his Correspondence,) remarks on the ignorance which still pervades the faculty with respect to consumption, and proposes as a remedy a pneumatic canopy, to cover the head and part of the bust of the patient, and so constructed as to convey warm air, gases, or medicated vapours, with a perfect command of temperature, into the lungs by inspiration.

Having thus referred to the new system of treating disorders of the lungs, which is so rapidly acquiring converts, we turn thence to the talent evinced by Dr. Elliottson in detecting the different diseases to which the heart is subject, in a work (illustrated with several beautiful engravings) which formed the substance of his Lumley Lectures, delivered last year before the Royal College of Physicians. It may be true that many of our pages teem with matter, both in prose and verse, which savours strongly of *affections* of this interesting organ: few of our authors, however, appear such perfect masters of its workings, or so acute in ascertaining all that is *ad in* the human heart, as Dr. Elliottson. Joking apart, this treatise evinces more science on this intricate subject than any that has hitherto met our eye; and by the unwearied attention with which the learned author has employed auscultation, by means of the stethoscope, he appears to be able at once to discover much which would otherwise be veiled in total darkness. The stethoscope, we may state, for the benefit of our general readers, is a hollow tube or cylinder of wood, through which, on applying one end to the chest, sounds are easily transmitted to the ear; and so marked are the peculiarities under different circumstances of disease both in the heart and lungs, that a person possessing experience and observation can thereby ascertain what disease exists, and thus be enabled to form his opinion and adapt his treatment accordingly. The objections with which almost every novelty or discovery meet in *limine*, the ridicule and sarcasm which they must all endure, are, we hear, rapidly yielding to the acknowledged utility of this instrument in distinguishing the nature of a disease, or (to use the received medical phrase) in "forming a diagnosis." Dr. Elliottson is an apostle for the use of the "stethoscope;" and in reply to those who, from not knowing how to use this talisman, are disposed to be sceptical of its advantages, he might quote Hudibras, in addition to his own argument:—

"Quoth Sidrophel it is no part
Of prudence to cry down an art,
And what it may perform deny,
Because you understand not why!"

"The alleged errors of those," he tells us, in his own prose, "who practise auscultation, are no arguments against it. Many tales of this description have proved inaccurate, or even altogether destitute of truth, when traced to their origin; and eagerly to catch at them, would shew a mind hoping that no fresh knowledge is to be attained. Persons, it is to be remembered, will pretend to skill who have none, and the skillful will sometimes give a hasty judgment. But, as in the case of phrenology, nature is open to us all. Let us examine for ourselves—examine carefully and patiently—not anxious to find auscultation a deception, but hoping to find the promise of new information fulfilled—not unwilling to

* The same instrument is also warmly appreciated by Dr. C. Scudmore.

learn, because we are no longer *in statu pupillari*—not so high in our own estimation as to feel indisposed to be taught by others—not unphilosophical enough to have a hostile opinion upon a matter which observation must decide—not guilty of the inconsistency of lamenting the imperfection of our art, of whining about its sad claim to the title of *ars conjecturalis*, and yet too indolent to investigate a method which professes to remove much of its uncertainty, is recommended by men of the greatest talent and the most intense application to the study of their profession, bears upon itself the stamp of probability, and the results of which are indeed capable of being proved physically necessary."

Without trespassing further on the attention of our readers, we can with truth assert, that a perusal of this work proves that Dr. Elliottson has acquired a profound knowledge of those morbid affections to which the heart is liable, and evinced much precision in distinguishing, and consequently, we presume, in relieving, diseases of the chest.

Plumbe on Vaccination, as a security against small pox, is a clever essay. It is strange that we should still need an advocate in such a cause, but prejudice is worse to cure than any disease. The ability with which the subject is handled in this little volume, will, however, we trust, still further dissipate the cruel obstinacy which yet tolerates small-pox inoculation.

The Medico-Chirurgical Transactions we are chiefly induced to notice as containing matter sufficiently interesting to every reader, there being nothing dearer to us than health and life. We are besides assured, from good authority, that no society in Europe or America has advanced the science of medicine so much as the Medico-Chirurgical Society of London, associating, as it does, among its members, the most eminent medical men of this and other countries, most of whom contribute to the above work, of which fifteen volumes have been already printed. It were vain to give any thing like a satisfactory digest of the whole of the essays composing the number before us; but we cannot avoid taking a cursory glance at one of them, in consequence of the novelty and interesting nature of the information contained therein. The essay we allude to is that upon Calculus, by Mr. Alexander Copland Hutchison, a most elaborate article, compiled with great industry, and with all the inferences drawn from a candid and impartial statement of facts. Mr. H. proves that stone, gravel, gout, scrofula, and cutaneous diseases, (all of which he considers to be allied, inasmuch as they all occur in the same diathesis,) seldom or never afflict seafaring people; shewing by official documents from the Naval Medical Board, and from surgeons of sea-port hospitals, that during the last thirteen years not a single case of stone or gravel has occurred in the navy, among an annual average of 25,000 seamen employed, and that only one case in a merchant seaman has been received into the sea-port hospitals during the above period, out of a floating maritime population of about 183,000, although 760 operations for the stone had been performed within the same period in these sea-port hospitals on other individuals. Mr. H. also shews that stone has been more prevalent in Scotland than in England during the last ten years, there being only one case in an average of about 83,000 of the population of the former country, while, according to Dr. Yelloly, there has been one case in an average of every 108,000 of the population of the latter. Some sensible rea-

sons are adduced for the cause of this discrepancy, which the author refers to in a former communication of his in the ninth volume of the Medico-Chirurgical Transactions. The almost total exemption of seafaring persons from stone, gravel, gout, scrofula, and cutaneous diseases, is a most interesting fact, and we believe new in medical science; and had Mr. H. intended to write an essay with a view of encouraging the nobility and gentry of England to send forth to sea such of their sons as were likely to be assailed by the above diseases, he could not have been more happy in his choice of a subject.

With regard to the small pamphlet, the last on our list, we shall only observe that, like all Dr. Thomson's productions, it displays that profound investigation and clear judgment which shews that he does not write till he has become fully master of that upon which he writes—qualities which impart great value to all that comes from his pen. Such professors do honour to the London University,* and cannot be too highly esteemed as instructors by the rising generation.

An Essay on the Distribution of Wealth and the Sources of Taxation. By the Rev. R. Jones, A.M. of Granville and Caius College, Cambridge. 1831. Murray.

THIS volume is, it appears, only part of an intended work, and is entirely devoted to the subject of *rent*. This is a subject which our political economists of late have been in the habit of making a very dry and repulsive speculation, not allowing that rent could be any thing except the excess of the produce of better soils over the worst cultivated, nor granting that the landlord's share could increase any otherwise than at the expense of the other classes of society. It was tolerably clear to any person who looked at the general condition of the nations of the earth, that this view of the matter could not apply to things as they are; and, we believe, it was understood that this was the fault of the habits and institutions of communities, and by no means attributable to the theory. It was held, that in proportion as societies advanced to such a point of civilisation as to be worth reasoning about at all, they would become proper examples of the orthodox doctrines.

We have no objection to make to this view of the matter; but we are glad to find that Mr. Jones has discovered, in modes of the tenure of land different from our own, something worth speculating about; and we think he has succeeded in a great measure in reducing to classes and principles the forms of society, so far as they are regulated by the relation between the proprietor and the cultivator of the soil. An advantage in this way of considering the subject is, that the rents or payments made by the cultivator in different ages and countries are closely connected with the domestic habits of the people, with the forms of their institutions, and with their progress in the arts of life and the scale of civilisation. In this way, all that we can learn from historians or travellers tends to illustrate some point or other of Mr. Jones's views; and he has manifestly made

* *Apocryph of this*—"A charter, which now only awaits the royal signature, is to be granted to the University of London, bestowing on this establishment all the privileges and powers at present enjoyed by the most favoured of our universities, the granting degrees in theology alone, for the present, being excepted. In compensation for which privation, the University of London is to be enabled to grant newly-invented degrees of Master of Medicine and Surgery, in addition to those better known, of Bachelor of Arts, Master of Arts, and Doctor of Medicine."—*Evening Paper*.

use of no small store of such materials in the construction of his principles. We shall, however, give our readers a clearer notion of his system by a sketch of some portions of it.

The rents about which alone our political economists have of late reasoned, are *farmers' rents*; that is, rents paid by capitalists cultivating the soil at their own expense by the labour of others; and these rents prevail in England, and in some measure in Holland and the Netherlands—but hardly any where else. The rents which really do exist in other parts of the world, Mr. Jones classifies as follows:—

1. *Labour or Serf Rents*.—These belong to cases where the peasant holds a portion of the land for his own subsistence, on condition of labouring for his lord a certain number of days in the week or in the year. This is the tenure in Russia, Hungary, Poland, Livonia, Esthonia: it obtains in some parts of Germany, where these rents are going through a slow course of demolition; and, little as our reader might suppose it, a fragment of this system subsists, under a very primitive form, in a corner of our own island. The Northern Highlands possess, or lately possessed, a race of teantry of this character.

2. *Metayer Rents*.—Under this tenure the cultivator extracts his subsistence from the soil, on condition of paying a portion of the produce (often half) to the proprietor. The latter also supplies him with stock. This mode of occupation belongs to a stage of civilisation more advanced than serf rents, inasmuch as it implies that the peasant can be trusted with the produce which his lord is to share. It has extended, and extends very widely, and in the nations whose history is the most interesting. It appears to have been the tenure of ancient Greece and Rome; it is still that of a large portion of France, though many small proprietors have been created by the revolution. It is common in Italy, the Valteline, the Vaudois, Spain, the Canary Islands, and exists in Afghanistan.

3. *Ryot Rents*.—The ryot is a labourer raising his own wages from the soil, and paying a produce-rent to the sovereign as its proprietor. Such rents are almost peculiar to Asia. They cover the surface of India, Persia, Turkey, and probably China, though we know little of them in that empire. In many of these countries they occur with more or less mixture of the metayer and the serf character.

4. *Cottier Rents*.—It is curious that it appears to be necessary to make an express and peculiar class for our unmanageable fellow-subjects of the emerald isle. The cottier is a peasant tenant, extracting his maintenance from the soil, and paying his rent in money. This last circumstance distinguishes these from metayer rents, and introduces a number of remarkable results into their operation. We are sorry to say, however, that most of these characteristics are of an unfavourable kind; and that the best quality Mr. Jones can discover in them is the facility with which they may be changed into something better.

5. *Farmers' Rents*.—Of the nature of these we need say no more than we have already said. But we must observe, that Mr. Jones's conclusions are here as wide of those of recent political economists as his classifications have been before. He denies, for instance, altogether, the law promulgated by Messrs. Ricardo and Mill, that every portion of additional produce must be obtained by the expenditure of a greater portion of capital, and that this is the only way in which rents can rise. He asserts that rents may rise while the difference of the

relative fertility of soils is diminishing—he asserts that neither a fall of profits, an increasing relative value of raw produce, nor an increasing money price of produce as compared with other countries, is any proof (as seems to be generally supposed) of the decreasing efficiency of agricultural labour. All these denials and assertions, and many more than we can here mention, he supports with an array of calculations and arguments which have so fair an appearance, that we must leave the political economists to dispose of them as they can. Nor have we here space to refer to the manner in which he brings his doctrines to a point, in various places, for the purpose of applying them to the position of England. He disclaims all concern with politics; and as we agree with him in this, we shall conclude with an extract from another part of the work.

It will easily be conceived, that the influence of the tenure of land upon the government, character, and manner of a people, is a subject of great interest, especially when illustrated by details. But it would probably hardly have been anticipated that we should find in Rajast'han, in the very heart of the ryot portion of the globe, a feudal system, resembling that of the middle ages of Europe, not only in the relation of the sovereign to the chiefs, but in the tone of feeling and principles of action which there prevail.

"The system of modified dependence on the chief for military services, as established in this part of India, has produced a resemblance to the state of Europe at a certain period of the progress of feuds, which is most striking, interesting, and instructive. That resemblance may be traced in the tenures and laws of the Rajpoots—in the mixed political results of these, both good and evil—and in the moral, and we may almost say poetical, characteristics of the population; in the deep and enthusiastic feelings which accompany their notions of fealty—in the emulous courage, the desperate fidelity of the nobles—and in many romantic and lofty traits of manners, worthy to have sprung out of the very bosom of chivalry, and extending their influence to the dark beauties of the Zenana, as well as to their warrior kindred. High-born dames in distress, still there, as they once did in Europe, send their tokens to selected champions, who, whether invested with sovereign power, or occupying a less distinguished station, are equally bound to speed to their aid, under the penalty of being stigmatised for ever as cravens and dishonoured. Col. Tod himself can boast an honour (well deserved by zealous devotion and disinterested services) which many a preux chevalier would have joyfully dared a thousand deaths to obtain—that of being the chosen friend and champion of more than one princess, whose regal, and indeed celestial, descents make the longest genealogies in Europe look mean."

We cannot but express our pleasure at seeing such a work as this proceed from the University press of Cambridge: it is on this account, and from the liberal conduct of the syndicate, we believe, that the price is so unusually low.

The Quarterly Mining Review. No. IV.

January, 1831. London: Boosey.

THE conclusion which would be most naturally drawn from a perusal of the title of the above work would be, that we should find in its pages reviews or notices of mining operations, of the state of mines in different countries, of the methods of ameliorating their condition; in fact, that the work would embrace all those niceties of mechanical art and theoretical in-

formation which are so requisite to the practical miner. This is not at all the case:—the object of the *Mining Review* appears to be, to give information almost solely on the state of the mines of the new continent, for the working of which so many associations have been formed in this country; and reviews of the proceedings of these associations occupy most of its pages. We have not studied the editor's general guide to the companies formed for working foreign mines, and therefore can scarcely give an opinion as to how far the circulation of a journal of this kind is ensured among shareholders, though the details seem to abound more in misfortunes than in successful results; and the unscientific explanation by which these are accounted for, (as the absence of oxygen at considerable elevations,) are really amusing. The editor promises, in the future numbers, to illustrate improvements in machinery, the mode of working mines, and the improvements in the German mechanical reduction and amalgamation. These are subjects which will give interest and importance to the journal, and which, if combined with condensed notices of the proceedings of foreign mines and mining associations, will render it a valuable addition to our periodical literature.

Gorton's Topographical Dictionary of Great Britain and Ireland. Vol. I. 8vo. pp. 759. London, 1831. Chapman and Hall.

THIS work commenced in monthly Nos. above a year ago; and when the first No. appeared, we expressed our cordial approbation of the plan, and our expectations of a valuable work, from that specimen of its execution. It has now run a third of its course—one volume, ending with the parish of "Eyton"—and has, so far, fully satisfied our hopes. The type is clear and good, the paper fair, and the illustrations in maps, &c. liberal, as well as neatly engraved by Sidney Hall. The information given seems to us to be very careful and very correct.

Elmes's Topographical Dictionary of London and its Environs. 8vo. pp. 418. London, 1831. Whittaker and Co.

ANOTHER most useful topographical publication, supplying all necessary intelligence with reference to the metropolis and its neighbourhood. Mr. Elmes has rendered an acceptable service to his fellow-citizens, who can now make out all the details which compose this extensive city, with its recent changes and multiplied establishments. In short, this is a volume of great and general utility.

The History and Antiquities of the Doric Race, by C. O. Müller. Translated from the German by H. Tufnell, Esq., and G. C. Lewis, Esq., Student of Christ Church. 2 vols. 8vo. London, 1831. Murray.

THE very learned work of Professor Müller, of Göttingen, is so well known to scholars, and so justly celebrated for its elaborate research, that we need say nothing of the importance of the present translation, which, passing over Müller's first volume, "*Orchomenos and the Minya*," takes up the second and third volumes, which comprehend an entire history of the Dorians, and gives us a vastly enlarged and improved edition of that valuable portion of the series, in the English language.

Readers must be well aware that a long and careful perusal of such a book is absolutely necessary, even for the limited Review which can be afforded to it in a periodical like ours: that

attention we shall bestow upon it, with reference to the ancient and classical authorities on which it rests; but, in the meantime, we are enabled to state that there is hardly a publication in existence which throws so much light on the "dim" regions of fable and mythology, and on the annals of early Greece. It is, indeed, a standard classic. The translators have had the powerful assistance of the original writer throughout, and have consequently added much excellent information.

ARTS AND SCIENCES.

ROYAL INSTITUTION.

MR. HARRIS on the influence of substances in any degree susceptible of magnetic change, as screens, in arresting the progress of the inductive energy of a magnet on a mass of iron. The recent discoveries in this department of science go far to prove that every known substance is in a greater or lesser degree open to magnetic excitation; but it had not yet been shewn that non-ferruginous masses could screen or stop out the action; on the contrary, from the few experiments hitherto tried, it was rather to be inferred that such masses were devoid of this screening power.* In the course of an extensive inquiry, however, by Mr. Harris, lately communicated to the Royal Society, it was observed, that though a single plate of iron, of about the tenth of an inch in thickness, could effectually arrest the action of a revolving magnet on a disc of copper, yet it had not the same effect on a disc of iron. In the latter case it was found requisite to multiply the intervening mass very considerably. Hence it seemed reasonable to infer that a screening power might actually be obtained by other substances not containing iron, but which were susceptible of magnetic change, provided such substances were employed in large masses. Such was found to be the case. The apparatus employed by Mr. Harris, and described by him, consisted of a magnetic disc, delicately balanced by means of a ring of lead, about a fine centre, and which was set rotating without sensible vibration, at the rate of 600 revolutions in a minute, by means of a train of wheels and a bog silk line rapidly run off from its circumference. When the disc was free of the silk and wheels, it was carefully covered by a closed cylinder of glass, having a flat surface above, and a light disc of tinned iron movable on a delicate point placed immediately over it; this last was also covered with a glass receiver, and was sustained on a plate of glass at about four inches distant from the revolving magnet. When the iron began to rotate, a large mass of copper, of about a foot square, and three inches in thickness, was interposed; the copper being placed on a convenient carriage, movable on a railway, so as to admit of being interposed very easily, without deranging the subject of experiment. The result was, that the motion of the iron became soon sensibly diminished, and at last ceased altogether. On withdrawing the intervening copper, the motion of the iron commenced, and this could be repeated at pleasure. Similar effects were evident with four heavy masses of zinc, in blocks, each about an inch thick. Mr. Harris had also, he observed, obtained the same result with a dense mass of silver, of about three inches thick. He, therefore, concludes that this screening power is common to every substance in any degree susceptible of magnetic excitation, and is probably in the direct ratio of its energy, as estimated

by observing its influence in fettering the vibrations of an oscillating magnetic bar. To exemplify a similar screening influence to that just mentioned, by means of distilled water at 32° of Fahrenheit's scale, or a little below, Mr. H. believes it would be requisite to obtain a slight action on the disc of iron at about thirty feet distance, so as to interpose nearly that thickness of ice. Mr. Harris accompanied his observations by occasional experimental illustrations: he seemed very carefully to distinguish between that magnetic state which amounts to a case of permanent polarity, and that induced or transient state which vanishes when the exciting cause is removed, to which he considered the immediate effects now in question might be referred; for whilst the intervening mass undergoes magnetic change by induction, it at the same time neutralises, in a greater or lesser degree, the power of the exciting magnet on a third substance.

In the library were many exceedingly interesting productions, amongst them several inventions of the lecturer; one called by him a Magnetometer, for the purpose of measuring the attractive or repulsive force under various circumstances; and another for the observation of oscillations in vacuo attracted considerable attention; as did also Mr. Parker's new *Æro* fountain lamp,* which was burning in the room. Our friends of the Zoological Society had sent a living chinchella; and Dr. Johnson had furnished some living specimens of the double-headed *planaria*. There were also on the table singular specimens of crystallised glass; lead which had been perforated by insects; and a variety of other objects.

LINNEAN SOCIETY.

A. B. LAMBERT, Esq. in the chair. Another portion of Mr. Blackwall's communication on the structure and economy of the spider was read. Sir Stephen Glynne, Bart. was admitted a fellow. Dr. Lyall, late British resident at the Island of Madagascar, presented several hundred dried specimens of the plants of that island. It ought to have been stated in our last notice, that another paper, by Mr. Blackwall, being remarks on the *pulvilli* of insects, was read. The author chiefly dwelt upon the formation of the foot of the *musca domestica*, or common house-fly; demonstrating that the old doctrine of its walking on glass and against gravity, by vacuum, was incorrect.

MEDICO-BOTANICAL SOCIETY.

EARL STANHOPE in the chair. Various presents were announced; amongst others, seeds of the *hermodactyle*, from Sir Henry Halford, referred to by Mr. Trallian as a cure for gout, and having a strong analogy to colchicum; also several bottles of the madar powder, from Sir James Macgrigor, found to be useful in the cure of cutaneous eruptions. Mr. Gilbert Burnett delivered his inaugural address as professor of Botany. He dwelt with peculiar force on the question, as to whether many of the active agents sought from foreign countries might not be extracted from our native plants; observing, that the late discovery of salicine might be given as an illustration in the affirmative; for although we have been so long ploughing the Atlantic, and burdening the bosom of the deep, to bring home harvests of Peruvian ague-cure, the truly valuable cinchona salicine extracted from our willows, as far as experiments have as yet gone, proves

equally efficient as a medicine with the quinine of Peruvian bark. The lecture, though necessarily very long, was listened to with undivided attention.

SWAN RIVER.

[We are favoured with the following recent and interesting accounts from this new colony:—]

Perth Town, Swan River, Western Australia,
Oct. 4, 1830.

My dear —, A ship being about to sail in the course of a week for England, I must not lose the opportunity of giving you a few lines respecting our movements and the state of the colony. I am somewhat late in my communications to my friends; but as this is the second ship only that has sailed direct for England since our arrival, you must not attribute the delay to any neglect on my part. The information which I can give you may be implicitly depended on. By the late accounts from England, it appears that the most exaggerated and false reports prevail regarding the present state and probable prospects of the colony, like all other reports that are a mixture of truth and falsehood; and as it is usual to paint the latter in the brightest colours, so it usually stands foremost in the picture: they have been industriously disseminated by a set of idle, worthless vagabonds, and have been eagerly taken up by the inhabitants of Cape Town and Van Diemen's Land. Those two places are so excessively jealous of the colony of Swan River, lest the tide of emigration should turn towards us, that the former use every means in their power to induce the settlers in their way here to remain with them; and they have been, I am sorry to say, too successful, having detained nearly two hundred labourers. The grounds of complaint are, that the colony is not equal to the representations given of it, and that it has not answered their expectations. The account in the *Quarterly Review*, as far as it goes, is correct, with one exception; but the impression it is calculated to make, when in unison with the hopes of needy adventurers, is too favourable to be realised. The *Review* observes, that the land seen on the banks of the Swan is of a very superior description, and this is undoubtedly true; but the imagination and enthusiastic feelings of many have induced them to suppose that *all* the land on the banks of the Swan, and the whole country besides, is included in that description. Now, the good land is chiefly confined to the banks of the rivers, as you will see by a map which I have sent to —; the rest is sandy, but it is covered throughout the year with luxuriant vegetation. The cause of this arises in some measure from the composition of the soil beneath, which, at an average depth of five or six feet, is principally clay, which holds the water in lagoons, that are to be met with in every hollow in every part of the country on this side the mountains. It unfortunately happens that none of the good land is to be seen even as far up the river as Perth, the whole soil of which is sandy; hence all new-comers are at first disappointed, and, without taking any further trouble to examine the country, leave the colony in disgust altogether. But it has now been found that the land at Perth, notwithstanding its unpromising appearance, possesses capabilities which intelligent and experienced persons foresaw, and that it only requires time and patience to develop its surprising qualities: at this moment there are vegetables growing to an enormous size, scarcely credible, and which for the sake of truth I actually measured. What say you to radishes twenty inches round, and grown in nothing

* See the interesting researches of Mr. Herschel, Mr. Lammé, and others, detailed in the Phil. Trans.

* Of this beautiful lamp we have given an account in another column.

but sand, without any manure or preparation of the ground? Turnips, cabbages, peas, lettuces, all flourish in the worst soils here; but I fear the climate is too warm for potatoes, though well adapted for most of the tropical fruits, as yams, bananas, &c. The soil and aspect of the country seems well suited for the vine, which, from the little experience we have had, does exceedingly well. There are no esculent productions worth mentioning indigenous, but there is some fine timber, which will no doubt become a valuable article of exportation; it is between the mahogany and the elder, and may be applied to all the purposes of the former; its greatest recommendation is, that the white ant will not touch it, and it will consequently be a great desideratum where that insect abounds. We have likewise the red and blue gum, but in no great quantity, in the immediate vicinity of Perth. The animal productions are the same as on the other side of the island, as also the birds. The rivers swarm with fish, every one of which is good eating; but it is only lately that we have been well supplied with them. There is abundance of lime-stone ready at hand in most parts of the river, as well as the finest and strongest clay, plenty of which runs along the shore that bounds Perth, for a mile and a half, as you will see by the map. Of the mineral resources of the country nothing is as yet known; for everyone has been too much occupied in locating himself, to give that subject any attention. By the reports from England, it appears that from the misfortunes which happened to the first ships that came out, a very unfavourable opinion is formed of the safety of the port. Gage's roads afford a very good anchorage during the summer months; but, being exposed to the north-west winds, it is a very insecure station during the winter, the ground being rocky and a loose sand; but this evil, I am happy to say, is in a great measure obviated by the discovery of a good anchorage about four miles to the southward of the mouth of the river, and marked in the map as the Britannia roads. The bottom is firm holding ground, and has been proved to be a very secure anchorage during the late gales, when all the ships in Gage's roads went on shore, while those on the Britannia roads rode it out, with the exception of one ship, which broke her anchor. Besides, a passage has lately been found out from Gage's roads to Cockburn, into which ships may run, if they are too much leeward of the Britannia roads; so that you see we may always have a refuge from the storm. I hope you will take care to give publicity to this circumstance, because it is one upon which the success of the colony mainly depends. The bar at the mouth of the river, and the flats in various parts of its course, are a great drawback to our internal communications; but these evils will no doubt be remedied in the course of time, and that without much expense. There is a clear channel all the way up the river for vessels of 500 tons, commencing about a mile and a half above Freemantle to Perth; then there are a succession of flats until you pass the islands, where the navigation continues clear for many miles up the river.

The climate of Swan River is the most delightful that can be imagined, and must always prove a most powerful recommendation of the place. The atmosphere is so exhilarating, and the heat of the day is so deliciously tempered by the sea breezes, as to render it more salubrious and more congenial than any other on the face of the globe. I do not send you the range of the thermometer, because it does not altogether serve as a criterion to judge of

the temperature, inasmuch as the degree of heat which would be intolerable in England is here most delightful. The prospects of the colony are every day improving, to the satisfaction of all classes; and the great number of respectable settlers, and their patience and perseverance in establishing themselves, are the surest grounds for the ultimate prosperity of the settlement. The only objections, as I can see, that can be urged with any degree of plausibility against the success of the colony, are, that the land at Perth and in the neighbourhood is not of that description to induce the settlers to cultivate, and that all the good land being now granted, there is no more on this side the mountains to satisfy the demands of new settlers; but these objections are, I am happy to say, about to be removed, as an ensign of the 63d regiment (a Mr. Dale) has lately returned from a tour of discovery into the interior, and has brought intelligence, that to the eastward of the Swan River there is a large and fertile tract of beautiful country, with a river passing through it, which, from a subsequent visit by Mr. Erskine, a lieutenant of the 63d, is likely to prove of the greatest importance to the colony. Those of the settlers who have not taken up their grants of land mean to secure them here, and myself among the number, a grant having been allowed me, at the rate of 3200 acres. The governor is quite delighted, and now considers the ultimate success of the colony to be certain; he intends visiting the country, and tracing the course of the river, in a few days; and it is my wish to accompany him, if possible, that I may select my own grant.

Inform me in your next whether you have any serious intentions of coming out: if you are determined to become a settler at Swan River, I should advise you not to delay, otherwise you may be put in the back settlements, and may lose the opportunity of an eligible appointment.

Our society consists chiefly of the government officers and their families, and are all pleasant and agreeable. The governor is much liked, and justly so; he is a most active, intelligent, and zealous man; his conduct is above all praise; his attention to the wants of the settlers and the interests of the colony entitle him to be called the father of the state. On the 23d of April, a levee was held at the Government House; and a dinner was afterwards given to his excellency by the magistrates and civil officers of the place, at the Perth hotel: we sat down about seventy, and at a time too when we were supposed to be in a state of starvation. The bachelors of Perth have issued invitations for a grand ball, to meet the governor and his lady on the 21st instant. We have a literary and philosophical institution, supported by all the most respectable settlers; it combines the advantages of a museum, library, and news-room: there is a whist club likewise for the gentlemen of Perth, who meet in rotation at each other's houses every Friday evening, which generally concludes with a good supper and all the convivialities of English society. Hence you will see that we are not so badly off, or so wretched, as reports will make us. In fact, the disagreeables and privations attendant upon the first stage of colonisation are passing by; every thing around us is assuming a more favourable appearance, and daily improving both in prospect and reality; tents and temporary sheds are giving way to substantial and comfortable buildings; and the settlers, beginning to enjoy themselves in a manner more congenial to their old habits, are happy and contented.

LITERARY AND LEARNED.

ROYAL SOCIETY.

DAVIES GILBERT, Esq. V.P. in the chair. The reading of Professor Davy's paper on a new combination of chlorine and nitrous gas was concluded. Mr. Gilbert, in pursuance of the new statutes, gave notice that he would at the next meeting propose for immediate ballot the Bishop of Chichester. Baron Cuvier presented his edition of the Books of Pliny's Natural History relating to animals; Mr. Davies, his Tables of Life Contingencies; and the publisher, Rose's Manual of Chemistry, translated from the German.

The following is an abstract of Mr. Cadell's paper on the hour-lines of the ancients, which was read at a recent sitting:—

The hour-lines on the sun-dials of the ancient Greeks and Romans correspond to the division of the time between sunrise and sunset. An example of these hour-lines occurs in an ancient Greek sun-dial, forming part of the Elgin collection of marbles at the British Museum, and which there is reason to believe had been constructed during the reign of the Antonines. This dial contains the twelve hour-lines, drawn on two vertical planes, with one inclined to each other at an angle of 166° ; the line bisecting that angle having been in the meridian. The hour-lines actually traced on the dial consist of such portions only as were requisite for the purpose the dial was intended to serve; and these portions are sensibly straight lines. But the author has shewn, in a paper published in the Transactions of the Royal Society of Edinburgh, that if these lines are continued through the whole zone of the rising and setting semi-diurnal arcs, they will be found to be curves of double curvature on the sphere. In the present paper he enters into an investigation of the course of these curves; first selecting as an example the lines indicating the 3d and 9th hours of the ancients. These lines are found by the bisection of all the rising and setting semi-diurnal arcs, commencing from the southern point, where the meridian cuts the horizon, and proceeding till the line reaches to the first of the always apparent parallels; which being a complete circle, meets at the end of its first quadrant. At this point the branch of another and similar curve is continuous with it; namely, a curve, which in its course bisects another set of semi-diurnal arcs, belonging to a place situated on the same parallel of latitude as the first, but distant from it 180° in longitude. Continuing to trace the course of this curve along its different branches, we find it at last returning into itself, the whole curve being characterised by four points of flexure. If the describing point be considered as the extremity of a radius, it will be found that this radius has described in its revolution a conical surface, with two opposite undulations above and two below the equator. The right section of this cone presents two opposite hyperbolas between asymptotes, which cross one another at right angles. This cone varies in its breadth in different positions of the sphere; diminishing as the latitude of the place increases.

The cones, to which the other ancient hour-lines belong, are of the same description, having undulations alternately above and below the equator; but they differ from one another in the number of the undulations, and some of them require more than one revolution to complete their surface. The properties of the cones and lines thus generated, may be rendered evident by drawing the sections of the cones on

the sphere in perspective, either on a cylindrical or on a plane surface; several examples of which are given in the paper.

SOCIETY OF ANTIQUARIES.

THURSDAY, Mr. Hallam in the chair. John Bruce, Esq. exhibited a small silver box in the shape of a skull, beautifully executed, with anatomical precision, found near the site of the abbey of Abingdon: it had a ring attached for the purpose of suspension from the neck, and Mr. Bruce supposed it to be a relic case. He stated that relics were formerly worn as charms against disease; and quoted several writers on the subject of caskets and cases for relics, and their different materials. R. C. Hussey, Esq. shewed drawings of some stained glass at West Horsley, in Surrey; and from a comparison of the dresses and ornaments on this glass with the monument of Archbishop Grey at York, and that of Bishop Marshall in Exeter Cathedral, he considered it to be of the time of Henry the Third. Mr. Britton exhibited some fine drawings of Headingham Castle, Crosby Hall, and the Hall of Penshurst Place: in the latter there is a fire-place without chimney, in the centre of the room, with the dogs for holding the fire.* Mr. Gage, director, communicated some remarks on the proposed removal of the organ screen at York Cathedral, and, as illustrative of these remarks, Mr. Britton exhibited a drawing of the transepts and screen, shewing the relative position of the screen and the pillars of the tower. Mr. Gage observed, that it having been stated at one of the meetings of the subscribers to the restoration of York Minster, that the director of the Society of Antiquaries was in favour of the removal of the screen, he begged, though at the eleventh hour, to express his dissent from such an innovation (which he called a heresy in church architecture), upon one of the most splendid remains of the architecture of our ancestors. He observed the careful distribution of the several portions of the building, and compared it with the divisions of others of our most ancient and splendid cathedrals. The cancelli or screen, after the establishment of the pointed style of architecture, was universally placed against the eastern pillars of the lantern arch. He considered the date of the screen to be the early part of the reign of Edward the Fourth, and observed that great injury would be done to the effect of this beautiful specimen of ancient art, by removing it back from the full light which it now has; but still worse from mutilation, as it will be necessary to reduce it in size, in order to place it in the situation proposed, and the choir and lady's chapel must lose some of their proportions in consequence of the removal—and all this, when it is not pretended that the alteration is necessary, but merely to shew the pillars of the tower. Mr. Gage contended that it was an innovation which, in its consequences, mutilated, changed, and confounded the parts of the sanctuary, contrary to the rubric of the church of England; and objecting to the effect, he adverted to the changes at Ely, which he deprecated. Mr. Gage's letter is addressed to Mr. Cholmeley, of Bransby, and is in the press.

FINE ARTS.

ROYAL ACADEMY.

THE Professor of Sculpture delivered the first of his course of lectures for the season in the

* So late as the year 1814, a similar fire-place was used in the hall of Gray's Inn: it was placed in the centre, immediately under the lantern, and the benches set round it at a circular table.

Royal Academy on Monday evening; Sir M. A. Shee, the President, in the chair.—In its general character the lecture was not materially distinguished from that of last year. Mr. Westmacott dwelt most forcibly on the necessity of the observance of those elementary principles which directed the practice of the Greek sculptors;—the necessity, indeed, of these principles, and of some standard to guide the artist, and direct the public opinion, was felt at a very early period by that people; and the astonishing productions which burst forth on the eighty-fourth Olympiad, was the effect of that spirit of progression and improvement which had been so rigidly enforced in the Syconian and Eginetan schools. In his history of the art, Mr. Westmacott avoided, as far as possible, archaeological disquisition; confining himself, in his review of the various epochs and distinguishing qualities of each, to the development of those principles which would contribute most to promote the progress of his art, and lead to practical utility: these epochs were exemplified by various interesting drawings from Egyptian, Etruscan, or early Greek works, and others from the earliest periods to the age of Pisistratus.

The lecture was attended by a numerous assemblage of the R.A. and distinguished men in science and archaeology.

Edward Landseer, Esq. whose brilliant talents well entitle him to the honours of his profession, was on Thursday week elected a Royal Academician. The vacancy was made by the death of the late president.

NEW PUBLICATIONS.

The Dutch Girl. Painted by G. S. Newton. Engraved by G. T. Doo. Moon, Boys, and Graves.

ONE of the most fascinating and admirably engraved fancy subjects which has appeared for a long period. It is pleasing in itself, and a perfect gem of art. Great and deserved popularity is certain.

The Empty Wallet. Painted by J. Inskipp. Engraved by W. Giller. Moon, Boys, and Graves.

THIS is another very sweet subject, with more of the pathetic than the arch in expression. In another style, it does great credit to Mr. Giller.

Bust of William IV.—A pretty little bronze bust of his Majesty, a likeness, and of a most convenient size for chimney or boudoir-table ornament, has just appeared. The resemblance of William IV. to George III. is very striking in this small but lasting production.

BRITISH INSTITUTION.

[Fourth notice.]

No. 289. *Highland Game.* Edwin Landseer, A.R.A.—As beautiful a little cabinet piece of finishing as we ever behold.

No. 291. *Ware Hare!* A. Cooper, R.A.—“Use every man after his desert, and who shall ‘scape whipping?’” Has the huntsman himself been guilty of no blunder in the performance of his duties? But this is “to consider too curiously.” The action of the whippers, and the alarm of the dog, are naturally though painfully represented.

No. 297. *A Sea Beach, with Figures.* T. S. Good.—In composition, character, and finishing, one of the artist's *goodest* productions.

No. 302. *The Bitter Morning.* R.W. Buss.—Quite in season: our feelings are perfectly in unison with the subject which Mr. Buss has

here so humorously and cleverly treated. The misery of quitting a warm bed, and the operation of shaving, with its cutting liabilities, in this cutting weather, are scarcely balanced by the prospect of a blazing fire and a substantial breakfast. But if this be the case with the well-provided, what must be the bitterness of such a morning to those who awake to the consciousness of pinching necessity of every kind!

“Take phizic, pomp;
Expose thyself to feel what wretches feel,
That thou may'st shake the superflux to them,
And shew the heavens more just.”

No. 303. *Mercury, in the disguise of a Clown, playing Argus asleep, in order to release Io from the shape of a Cow.* B. R. Haydon.—We fear that subjects of this class are very little in request at the present day; and that an artist, whatever may be his talents, would have a much better chance of encouragement and patronage, by employing those talents in painting a prize ox, rather than a classical cow. There is great skilfulness of composition and richness of colour, as well as a beautiful effect of sunlight, in this able performance.

No. 319. *Preparing for the Portrait.* T. Clater.—Highly creditable to the artist, as regards both fidelity of imitation and power of execution. We do not recollect to have seen the gloss of satin, the Persian tapestry, and the several other accessories introduced into this picture, more successfully painted by the best masters of the Flemish school.

No. 320. *An Arabian Mare and Foal.* James Ward, R.A.—A charming picture of its kind. What a powerful sentiment of affection in the mother! What delightful vivacity in the offspring! And through the whole (with the exception of one spot of light, near the window, which strikes us as being rather out of harmony), the most luminous and picturesque effect conceivable.

No. 331. *Part of the Interior of the Convent of St. Benedetto, near Rome; Peasants at their Devotion to the Madonna.* J. Stevens.—This singular performance is evidently an experiment. It is painted on a granulated or sandy ground, which, where it is not sufficiently covered, sadly mars the effect. Although not very skilfully composed, some of the individual characters are of a very superior order, and are very ably treated.

No. 337. *Departure for Waterloo.* R. Edmonstone.—A kind of parody on the parting of Hector and Andromache, in which Mr. Edmonstone has manifested his usual skill in character, expression, and execution.

No. 345. *An Interior of a Picture Gallery, with Portraits.* P. C. Wonder.—Subjects of this kind are always attended with difficulty, and are generally deficient in that essential quality of art, effect. There is always a contention between the paintings and the living persons; and when, as in the present instance, those living persons are individuals of high rank and character, the evil is likely to be still greater. How could it be expected that the artist should keep Lord Farnborough in the back ground, throw a half tint over Sir Robert Peel and the Hon. Agar Ellis, or involve Sir George Murray, Mr. Watson Taylor, and the Rev. Holwell Carr, in deep shadow? Under such circumstances, it would have required a miracle to insure success: as it is, however, the performance is a wonder.

No. 351. *Jealousy.* R. T. Bone.—A sketched but spirited performance; beautiful in colouring, and full of what may be termed pictorial romance.

No. 364. *The tired Model*. R. T. Lonsdale.—The tired model is a dog, and the painter is, we understand, the veteran Northcote, who is endeavouring to rouse the jaded animal by tinkling a brass pan at his ear. Mr. Lonsdale has introduced a number of objects of still life, which are finished in a very fine style of art.

No. 366. *Ullswater, from Yew Crag*. T. C. Holland.—This artist's works have always a skill in execution which cannot fail to recommend them. The effect in the beautiful scene under our notice is so calm and tranquil, that it must have a soothing influence over all who gaze upon it.

No. 367. *Lucentio, Hortensia, and Bianca. Taming of the Shrew*. Miss Alabaster.—We regret, on our own account, as well as on that of the fair artist, that this apparently clever performance is not placed in a situation in which its executive merits might have been more thoroughly appreciated.

No. 373. *Magdalen College, Oxford*. A. G. Vickers.—Full of talent; although, like some other performances by this able artist, rather too ashy in its tone.

DRAMA.

KING'S THEATRE.

THE incomparable David has at length arrived, and consequently triumphed, in London. What would we not have given to have heard this great singer in his prime! Even as he is, a shadow of his former self, he is so far superior to any thing we could have imagined, that the pilgrimages made by his countrymen from all parts of Italy to the happy city that possessed him, are no longer extraordinary in our eyes. *Ricciardo e Zoraide* was performed on Saturday, for the purpose of introducing him to an English audience. His reception on his *entrées* was most enthusiastic: his appearance was against him. A tall, thin, (we may almost say) emaciated figure, vilely dressed; the shawl twisted about his neck and shoulders adding very unnecessarily to the height of the latter; his carriage awkward, and his action so extravagant, as to remind one of those caricatures of Italian opera singers which used to figure in the print-shops in our boyish days. Here was nothing particularly prepossessing. His opening recitative also betrayed the ravages time had made upon his voice; but the first aria banished every doubt of the justice with which he had been entitled the first tenor in the world. David sings with all his heart and with all his soul; exuberant in his ornament to a degree unparalleled in our experience, he never for an instant loses the expression of the sentiment. His hands, his whole frame, trembled with the excess of his feeling. Be it wrath or be it love, the *roulades*, which in another would seem ridiculously out of place, with him are outpourings of the spirit. The florid style is our abhorrence; but David, though the king of cadences, renders them so beautifully subservient to the sentiment, invests them with such meaning and character, that, having once heard, we could not tolerate the air without them. The compass of his voice is very extensive, and his shake is singularly perfect; a most rare circumstance on the Italian stage, where it is little encouraged. His eyes are good, and the general character of his face pleasing. A slight resemblance to Velluti was observed by several persons near us; but we imagine it arose more from a similarity of gesture than of features. His duet with Zoraide in the second act, and the exquisite air

which terminates the opera, were vehemently encored; and on the fall of the curtain, loud calls for David were mingled with the "bravos" and "bravissimos" of the whole house. He came forward, bowed his gratitude, and retired amidst renewed and redoubled plaudits. A Mademoiselle Beck made her first appearance the same evening, and sung with taste and judgment. Curioni was in capital voice; but Miss Fanny Ayton—it needed all the witchery of David to drive the "cruel and barbarous murder" of the delicious "Cruda Sorte" out of our ears!

DRURY LANE.

THE oratorios commenced here last night: of course too late for us to notice them this week. The most striking feature in the bill, however, after the announcement of Braham and Miss Paton, is the following piece of composition:—"The whole of the band of this theatre is engaged, and which is of the grandest and most extensive scale."

COVENT GARDEN.

YESTERDAY week was produced *Comrades and Friends*, a translation of Monsieur D'Aubigny's *Deux Sergents*. It has been well characterised as "one of the condemned-to-be-shot-but-miraculously-saved school." We really had begun to imagine that the "make-ready," "present," and not "fire" melodramatists, had contentedly settled down in Surrey; but alack!

"They rise again
With twenty mortal murders on their crowns,
And push us from our stools!"

To atone, however, for the staleness of the *dénouement*, we have, certainly, some astounding novelties in the progress of the plot. Two *sergents* of a French regiment of the line are *sentinels on the same post*, and permit "a mother seeking her husband" (we quote the translator's own bit of pathos), to pass the *cordon sanitaire*. For this act of humanity they are sentenced to be shot; but the court, taking the motive into consideration, consents to be satisfied with one life, and permits the culprits to cast lots for the chance of escape. The loser has a wife and child, who have been ignorant of his fate for five years, and he wishes to give them personally the pleasant information that he is not yet dead, but that he is going to die the next morning. "The fortunate holder of the highest number," (as the late lottery bills would have expressed it), magnanimously offers to do Pythias to his friend's Damon; and, taking the chance of his return in time to be shot, absolutely succeeds in persuading the officer commissioned to witness the fatal raffling, to falsify his report to the court-martial! Away goes the modern Damon to the Isle of Rosas, in a sailing packet, too! to time his passage with more certainty. The commander of the said packet burns it, to prevent his return. Burns a government packet, gentle reader!—and at the suggestion of an adjutant, the very complaisant officer aforesaid!—"The captain's a bold man." A Portuguese vessel, however, touches at the island, and our Damon, of course, arrives just time enough to be present at the "present," and to put out the "fire" with his own pardon tied to a colonel's commission, he having been originally a much-bellied paymaster, suspected unjustly of eloping with the military chest of his regiment!—"No waiter, in short, but a knight templar." Warde was the *Damon*, Abbot the *Pythias*. Miss Taylor—poor Miss Taylor! was condemned to play the heroine. Mrs. Chatterley had about a dozen lines to say

in the first scene of the second act; and Mrs. Vining, as the wife, we presume, of the jailer, walked about in a hat and forty thousand feathers. The actors did their utmost, and the audience were satisfied—why should not we be? Mr. Pocock has been named as the prescriber of this "mixture as before." The dramatist of *Rob Roy*, *Hit or Miss*, and the *Miller and his Men*, ought to have known—and what is a still more serious charge—does know better.

On Thursday, *Much Ado about Nothing* was played with a strong cast. Miss F. Kemble the *Beatrice*, Miss Taylor *Hero*, C. Kemble *Benedict*, *Dogberry* Blanchard, *Verges* Keeley, besides Warde, Bartley, Abbott, and others, filled the comedy to the entire satisfaction of the audience. We have not time, now, for criticism.

VARIETIES.

New British Heath.—A heath which was regarded as being indigenous only to the countries bordering on the Mediterranean and to Portugal (*Erica Mediterranea*), has been found by Mr. Mackay, of the Dublin Botanic Garden, growing in "prodigious abundance" in the mountainous district of Cunnemara. This is the most important addition which has, of late years, been made to the Irish Flora.

New Lamp.—Among the useful applications of scientific knowledge to our improvement in domestic articles, we have this week to mention a lamp of a new construction, and on a new principle, which was exhibited on Friday at the Royal Institution, and one of which is now burning on our table before us, affording us the light by which we describe its brilliancy and good qualities. It is the invention of Mr. Parker; and certainly for illumination is equal to oil gas, which it surpasses in steadiness and equality. The essence of the invention is, that a column of air keeps the oil always at the proper height of the wick, so that the flame is continually of the same splendour, without flickering. Yet the machinery is most simple, and the form agreeable. There are no rims to cause shadows; and altogether we do not know when we have been more pleased with a thing of the kind for daily use or ornament. The new lamp is truly a new light.

Mr. Holman.—Our famed blind traveller, we learn, left Calcutta in August last, and has since been heard of from Singapore. He is on his road to the celestial empire.

Cleanliness of Birds.—The following curious fact is mentioned by Mr. Ainsworth in a communication on the cleanliness of animals. — (*Journ. Roy. Institution, No. II.*) "Walking one day along the shore of Holy Island, off the coast of Northumberland, I disturbed an ash-coloured sanderling (*Calidris islandica* Steph.), which flew heedlessly, and as if injured. On shooting the bird, I found that it was covered with vermin, more especially about the head; so much so, that the poor thing must have fallen a victim to their tormenting ravages: on further examination, I found that it had lost one of its legs, so that it was from its incapability to rid itself of these insects that their extraordinary increase was to be attributed. Poultry (the same naturalist remarks) which run about in stony or paved yards, wear away the points of their claws by friction and digging, which renders them unfit to penetrate their coating of feathers; they are, therefore, more covered with vermin, and in consequence more sickly than fowls from the country."

British Frogs.—The natter-jack was ad-

mitted into the British Fauna on the authority of Sir Joseph Banks. Mr. Gray states it to be very common on Blackheath, and on Putney and Clapham commons. Its croak is very peculiar. The edible frog, admitted by naturalists as British, is not to be found in Great Britain: we have thus less credit than might be supposed for our not eating these reptiles.

Madarine, a new Vegetable Principle.—Dr. Duncan, of Edinburgh, has obtained a peculiar principle, which he names madarine, from the madar plant (*Calotropis madari*), known in the East as a powerful medicine.

Extraction of Potash from certain Minerals.—This alkali, so important in the arts, may, it is stated, be extracted from minerals containing it, by a very ample process. This consists in merely calcining them with lime, and then leaving them for some time in contact with water, which is afterwards filtered and evaporated. M. Fuchs, as quoted in the *Ann. de l'Industrie*, states, that he has in this manner obtained from 19 to 20 per cent of potash from felspar, and from 15 to 16 per cent from mica.

New Species of Felspar.—Professor Gustavus Rose, of Berlin, has found that the glassy felspar from Laachek, on the Rhine, and from Vesuvius, forms a distinct species. The observed faces have nearly all the faces of the Adularia, and the same parallelism of edges. Professor Rose is expected, now that he is returned from his journey with Humboldt, to give an analysis of this species.

Okenite.—This new mineral species has been detected by Professor Kobell, of Munich, among the zeolitic minerals from Greenland, and named in honour of the celebrated naturalist Professor Oken, of Munich. The mineral is found at Kudlisat, in Disco island, and forms an amygdaloid of a fibrous or thin radiated structure. Colour, white, yellowish, and bluish white; translucent; lustre, pearly; hardness, between that of felspar and fluor; specific gravity = 2.28; formula, $C_2S_4 + 2Ag$.

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. VII. Feb. 19.]

NEW PUBLISHING SCHEME.—Many of our readers have, no doubt, seen a prospectus for opening a new publishing shop, under the direction of a committee of twenty-one managers;—a scheme which, we fancy, however well intended, not only never can succeed, but never can be begun. For though we see the names of several much-esteemed friends of ours at the head of it, we must say the plan seems really to want all that could recommend a design of the kind to success. It wants the sinews of adequate capital; it wants concentration in its direction; it wants the details of business; it wants premises for a local habitation; it wants agents to publish what it may adopt; it wants authority competent to judge of what deserves publicity;—in short, it wants every thing but a humane and worthy object. So apparent are these defects, that though several meetings have been held, they have attracted little or no attention and support. The last meeting went off like the preceding, with an adjournment to the 15th of next month.

Kilmarney Legends, edited by T. Crofton Croker, Esq.; being a new edition, revised and corrected, of the Legends of the Lakes, with contributions from the Hon. Mrs. Norton, G. P. R. James, Esq., &c.; and illustrated by six engravings of scenery.

LIST OF NEW BOOKS.

METEOROLOGICAL JOURNAL, 1831.

February.	Thermometer.		Barometer.	
	From	To	30.11	to 30.15
Thursday... 10	43.	57.	30.11	30.15
Friday... 11	42.	55.	30.13	30.18
Saturday... 12	42.	55.	30.18	30.21
Sunday... 13	42.	55.	30.16	30.11
Monday... 14	46.	48.	30.13	30.15
Tuesday... 15	36.	47.	30.06	29.90
Wednesday 16	35.	50.	29.76	29.93

Wind variable, S.W. prevailing.
Except the 13th, generally clear; rain fell on the mornings of the 12th and 16th—mizzling rain during the 13th.
Rain fallen, .225 of an inch.

In compliance with the request of a correspondent, we here subjoin a tabular view of the extreme heights of the thermometer for the month of February since 1808.

1809 the maximum was 53°	1820 the maximum was 52°
1810..... 54	1831..... 52
1811..... 54	1832..... 56
1812..... 54	1833..... 50
1813..... 56	1834..... 56
1814..... 49	1835..... 54
1815..... 55	1836..... 54
1816..... 52	1837..... 54
1817..... 55	1838..... 56
1818..... 54	1839..... 56
1819..... 53	1840..... 53

From the above table it will be seen that the temperature on the 9th inst. exceeded the mean of the maximum of the past twenty-two years by rather more than 8°.

CHARLES H. ADAMS.
Latitude..... 51° 37' 32" N.
Longitude..... 0 3 51 W. of Greenwich.

GENERAL ACCOUNT FOR THE YEAR 1830.

(Kept at Edmonton.)

Month.	Winds.						Rain.	Barometer.			Thermometer.

Year...	11	21	12	13	14	15	23.835	1.93	29.890	30.32	48.21	33	29.6

The mode of keeping the above register is as follows:—the warmth of the day is observed by means of a thermometer exposed to the north in the shade, standing about four feet above the surface of the ground. The extreme cold of the night is ascertained by a horizontal self-registering thermometer, in a similar situation. The daily range of the barometer is known from observations made at intervals of four hours each, from eight in the morning till the same time in the evening. The weather and direction of the wind are the result of the most frequent observations. The rain is measured every morning at eight o'clock.

TO CORRESPONDENTS.

We are sorry we have not room for R. E. of Redruth's letter.

The statement respecting partialities in adjudging the honours at Cambridge, is under consideration.

The Mr. Rogers who invites us to see some ancient

carvings and basso-relievs, would have been more intelligible if he had told us so.

We regret that we cannot insert J. A. of New York's verses to the memory of J. Keats. By the by, postages across the Atlantic, per ship Ontario, &c. are notified.

Neither has J. W. R., though pleasing, found sufficient favour in our sight for publication.

In our account of Mr. Thomas Hope is a sentence, which, from the hurried manner in which our multifarious sheet is sometimes put to press, is not only incomplete, but not expressive of our own opinion. Speaking of Downing College, the sentence should have run—"the part erected has been generally disapproved by those persons who consider that Gothic designs are more in harmony with the college buildings of Oxford and Cambridge; and where that style has recently been successfully imitated both by Mr. Wilkins and some other professional gentlemen." We have too high an admiration of Mr. Wilkins' talents to question their application.

ADVERTISEMENTS,

Connected with Literature and the Arts.

BRITISH INSTITUTION, Pall Mall.—

The Gallery for the Exhibition and Sale of the Works of British Artists is Open Daily, from Ten in the Morning till Five in the Evening.

Admission, 1s.—Catalogue, 1s.

WILLIAM HARNARD, Keeper.

A MARRIED CLERGYMAN, M.A. late of Christ College, Cambridge, assisted by his son and resident at Weymouth, receives into his House Six Pupils for Tuition in Classical and General Learning, and in the Elements of Mathematics, who will be treated as his own Family.

For further Particulars and References, apply by letter (post paid), to the Rev. C. P., care of Mr. H. Wix, Bookseller, 41, New Bridge Street, Blackfriars, London.

This day is published, price 4s.; or India Proof, 7s. **LANDSCAPE ILLUSTRATIONS of the WAVERLEY NOVELS, Part X.**

"The Tower in 1070," for Fervent of the Peak, by D. Roberts; "Linthgow," for Waverley, and "Inch-Cailiesch," for Rob Roy, by Robson; and "Locheness Castle," for the Abbot, by Gauthier, are the ornaments of this beautiful Number, which equal honour to the painters and engravers."—*Literary Gazette*, Feb. 5th.

To Civil Engineers, Architects, &c. &c.

This day is published.

A PRINT of THOMAS TELFORD, Esq.

M.R.S.L. and E. and President of the Institution of Civil Engineers. Engraved in the Line Manner by W. Raddon, from a Picture in the Possession of the Institution, painted by S. Lane.

India Proof, 2s. 6s.; French Proof, 2s. 6s.; Prints, 11s. London: Published by Edward Turrell, 46, Clarendon Street, Somerset Town; W. Raddon, 38, St. James's Street, Regent Square; and by the Secretary of the Institution, Buckingham Square, Strand.

NEW ORLEANS DEPOT and COMMISSION STATION, &c. for BOOKS, SCHOOL APPARATUS, STATIONERY, &c.

The rapidly increasing population of the Mississippi and its vicinity to the neighbouring states of Spanish America, give to the market of New Orleans the most palpable advantage over any other in the United States, for the diffusion of all works of literature and elementary instruction in the English, French, and Spanish languages. The great commerce of the town renders English, French, and Spanish books and stationery in as much demand as the manufactures of the United States. The Proprietor of the above establishment, Mary Carroll, begs leave to recommend to the attention of Publishers and Booksellers generally, the great advantages which must result to them in consigning to a factor or agent, whose sole attention is confined to this particular department, and whose interest must necessarily be promoted in proportion to the circulation she creates, and the sales she effects for consignees, and not by the exactions of heavy profits.

Reference is given to Messrs. A. Gordon and Co. Liverpool; Messrs. Price, Gifford, and Co. London; and to the principal Booksellers in the United States.

MUSIC.

TO the NOBILITY, GENTRY, and INHABITANTS of Brompton, Knightsbridge, Chelsea, Fulham, Kensington, &c.

M. A. JACOBOWITZ, of Stouthing, Russian Poland, begs most respectfully to inform his Subscribers and Friends, that his Private Evening Concerts will take place as follow:—At the Concert Room, Ford Place, Fulham Road, on Thursday, the 9th February; and at the Assembly Room, King's Arms, Kensington, on Thursday, the 3d of March.

Tickets, 5s. each, to be had at Symonds' Library, 4, Brompton Terrace, &c.; and at Wild's Kensington Library, Kensington.

BOOKS PUBLISHED THIS DAY.

The 5th edition, 5s.

THE SECRETARY'S ASSISTANT, exhibiting the various and most correct Modes of Super-scription, Commencement, and Conclusion of Letters to Persons of every degree of Rank, including the Diplomatic, Clerical, and Judicial Dignitaries; with Lists of Foreign Ambassadors and Consuls. Also, the forms necessary to be used in Applications or Petitions to the King, the House of Commons, the Lords, and the Commons, Government Offices, and Public Companies; with a Table of Precedency, and Abbreviations of the several British and Foreign Orders of Knighthood.

A Dictionary of Quotations from the British Poets. 3 vols. 12mo. 5s. cloth.

THE ILIAD of HOMER, translated into

English Verse.

By WILLIAM SOTHEY, Esq. "It is evident, from what we have said and quoted, that Mr. Sothey has united with a classical closeness of translation, considerable harmony of numbers."—*Edinburgh Review*, July 1830. "We must pause here, satisfied that we have submitted enough to justify the anticipation that Mr. Sothey is the man to supply a suitable version of Homer to the literature of this country."—*Monthly Review*, No. 56, June 1830.

John Murray, Albemarle Street.

A cheap edition, being the 3d, small 8vo. 6s.

FINANCIAL REFORM.

By Sir HENRY PARNELL, Bart.

The whole of this work has been carefully revised, and several important additions have been introduced, comprising, among others, the following Subjects:—Duties on Coal, Beer, and Sugar;—the Corn Laws, Government Manufactures, Collection of the Revenue, French System of Public Accounts, the Civil List, Colonies.

To which are added, Tables of the Civil List Pensions, and of Salaries above 1000l.; together with a very complete Index.

"Sir Henry Parnell's admirable work, to which we have more than once directed the attention of our readers."—*Times*.

"It is a rapid survey, clear, ingenious, and diversified."—*Quarterly Review*.

"No book ever appeared on financial topics bearing with it a greater claim to attention than this."—*Westminster Review*.

John Murray, Albemarle Street.

A SELECTION from the PAPERS of the

EARLS of MARCHMONT, illustrative of Events from 1685 to 1750; in the possession of the Right Hon. Sir G. H. Rose.

These volumes contain many original Letters from some of the most celebrated characters of the time; among others, from Lord Bellingbrooke, Mr. Pope, Sarah Duchess of Marlborough, Sir William Wyndham, Lord Lechmere, the great Lord Chesterfield, John Duke of Argyle, Lord Cobham, the Duke of Montrose, &c. &c.

The work throws much light on the following interesting events:—the ill-fated Expedition of the Earl of Argyle;—the Landing of William III.—Battle of the Boyne—Union with Scotland—Rebellion of 1745—Battle of Falkirk.

John Murray, Albemarle Street.

THE INCOGNITO; or, Sins and

Pecadilloes. By the Author of the "Castillon," &c. &c. Printed for Whittaker, Treacher, and Co. Ave Maria Lane.

THE LEGAL OBSERVER; or, Weekly

Journal of Jurisprudence, price 6d. Fourteen Numbers have been published, and the following are the principal advantages it presents.—1. The first authentic report of all decisions in the Superior Courts, by Barristers of the several Courts.—2. Digests of all reported Cases, and Abstracts of the most important Judgments.—3. Bills in Parliament effecting any change in the Law, and all important Acts of Parliament, with Notes explaining the alterations introduced by them.—4. Law Reform, or articles in which all changes in the Law are discussed.—5. Judicial Character.—6. Selections of the Bar.—7. Reviews of all Legal Publications.—8. The earliest intelligence on all professional subjects.—9. Legal Biography, Anecdotes, and Miscellanea.—10. Occasional Supplements, containing all Debates in Parliament on Legal Subjects, Lists of Bankrupts, Insolvents, and Disolutions of Partnerships, Barristers called, Attorneys admitted, &c. &c. The work is commenced with any Bookeller; and the Proprietors appeal with confidence to the Numbers already published, and to those now publishing, as amply fulfilling all the objects above mentioned; and, as the circulation is very extensive, they recommend it as an advantageous medium for all Advertisements connected with the profession.

Published every Saturday Morning, by John Richards, 104, Fleet Street; Adam Black, Edinburgh; and R. Milken and Son, Dublin (where Advertisements will be received); and to be had of all Booksellers, Newsmen, and Agents.

The First Supplement will be published on Tuesday next.

In 2 vols. 8vo. price 11. 6s. boards, with a Portrait by Deane and a Map.

THE LIFE of the Right Rev. T. FANSHAUL MIDDLETON, D.D. late Lord Bishop of

Calcutta. By the Rev. CHARLES WEBB LE BAS, M.A. Professor in the East India College, Hertfordshire, and late Fellow of Trinity College, Cambridge.

Beautifully printed, and embellished with Frontispiece, and a Map.

A FIFTH and SIXTH VOLUME of

A LORD BYRON WORKS, containing Poems not included in any previous Edition, many of them published for the first time.—English Bards, Hints from Morace, Mevra and Earth, Werner, Deformed Transformed, the Island, &c. &c. to match with the Edition of Lord Byron's Works in 4 vols. here rendering it the first and only complete edition ever printed. (See Jan alone being excluded.)

John Murray, Albemarle Street.

A NEW NUMBER of the QUARTERLY

REVIEW is published this day. It contains Articles on Reform in Parliament—on the Introduction of Poor Laws into Ireland—Present State of Spain—Ancient Scottish Criminal Trials—Herschel's Treatise on Sound—The Greek Dramatic Poets—The American's Edition of Townson—Memoirs of Oberlin, &c. &c.

Albemarle Street, Feb. 11, 1831.

ON January 26th was published, Quarterly

Review, No. 57, containing:—I. The Political Economists.—II. Mr. Southey's Lives of Uneducated Poets.—III. On the Principles of Morality, and on the Private and Political Rights and Obligations of Man.—IV. Coleridge on the Study of the Greek Classics.—V. The Education which ought to accompany the late French Revolution.—VI. Moral and Political State of the British Empire.

Family Library, No. XX. Illustrated with Highly Finished Engravings, from the Sketches of

SKETCHES from VENETIAN HISTORY.

By Mr. Murray's Family Library—a title which, from the valuable and entertaining matter the collection contains, as well as from the careful style of its execution, it well deserves. No family, indeed, in which there are children to be brought up, ought to be without this Library, as it furnishes the reader with the best education which ought to accompany the late French Revolution.—VII. Moral and Political State of the British Empire.

Monthly Review, Feb. 1831.

John Murray, Albemarle Street.

GREEK SEPTUAGINT, with the

Apocrypha. Edited by A. J. VALPY.

From the Oxford Edition of Bos and Holmes. This edition is printed in a cheap form for schools, in 1 vol. 8vo.; for use also in churches and chapels, as well as the library.

(This elegantly executed volume is very correctly printed, and which cannot but recommend it to students in preference to the incorrect Cambridge and Amsterdam editions of the Vatican text); its price is so reasonable as to place it within the reach of almost every one.—*Horne's Introduction to the Bible*.

Printed by A. J. Valpy; and sold by Longman, Baldwin, Whittaker, & Co. and all Booksellers in Town and Country.

Also, 3d edition, price 5s. 3 vols. 8vo.

Greek Testament, with English Notes, con-

taining copious Critical, Philological, and Explanatory Notes; with Paraphrases, &c. from the Classics, and with References to Vigners for Idioms, and See for Ellipses. By the Rev. F. Valpy, B.D.

This work is intended for the Use of Students in Divinity, as well as for the Library.

"After a minute examination, the author of the present manual considers this Greek Testament the most valuable that has yet been published with critical and philological apparatus, especially for students who wish only one edition of the Greek Testament."—*Horne's Introduction to the Bible*.

Printed by A. J. Valpy, and sold by Longman, Baldwin, Whittaker, & Co. and all Booksellers in Town and Country.

Also, 3d edition, price 5s. 3 vols. 8vo.

The London Vocabulary, Latin and English, &c. &c.

Printed for Longman, Rees, Orme, Brown, and Green.

Blam and Cockin China.

8vo. edition, in 2 vols. with Map and 25 Plates, 11. 11s. 6d.

AN ACCOUNT OF SIAM and COCHIN CHINA; being the Journal of a Residence in those interesting and little-known Countries, exhibiting a complete View of their present State.
By JOHN CRAWFORD, Esq. F.R.S. F.L.S. F.G.S. &c. London: Printed by R. Taylor.

*To the friend of intelligence relative to these far eastern countries, the present work is an addition, not only of great interest, but of great importance and authority.—*Literary Gazette.*

*Mr. Crawford has presented us, in the present work, both with a very valuable contribution to the geography and statistics of the oriental world, and with one of the most interesting narratives we have for some time since been called upon to notice. The countries of which he gives us a description, although they attracted considerable attention from the earliest European adventurers to India, and were even regularly resorted to by our vessels for some years after our first establishment in the East, had for a long period been almost excluded from the range of our commercial operation; and in regard indeed to their recent and actual condition, might be said to be nearly unknown to us.—*Monthly Review.*

*A very valuable addition respecting a part of the world in which the commercial interests of the country may in all probability be concerned to a very important extent.—*Times.*

*A mass of invaluable information for the trader, as well as for the man of science and letters.

Also, by the same Author,

An Account of Ava; being a Journal of a Residence at that Court. By John Crawford, Esq. late Envoy.

In 2 vols. with Maps and Plates. *We recommend it to the perusal of all who are connected by ties of commerce with the East, or who are solicitous for information on this portion of our oriental relations.—*Literary Review.*

Henry Colburn and Richard Bentley, New Burlington Street.

In royal 8vo. the 8d edition of
DR. DONNEGAN'S GREEK and ENGLISH LEXICON, containing nearly 1400 closely printed pages, in Three Columns. Half the work has been re-written, the remainder carefully corrected and improved, and about 300 pages added. The whole under the superintendence of the Author. A liberal Allowance to Teachers.

*The Sixteenth Part, completing the Second Volume of "Menageries," is in the press; as well as the Seventeenth and Eighteenth Parts, forming the Ninth Vol. of the Series—the "Mechanics of Birds."

London: Charles Knight, Pall Mall East.

Military Memoirs and Histories.
Lately published by Henry Colburn and Richard Bentley, New Burlington Street.

CAPTAIN BLAKISTON'S NARRATIVE OF TWENTY YEARS' MILITARY ADVENTURE IN THREE QUARTERS OF THE GLOBE. Comprising an Account of the early Military Career of the Duke of Wellington in India, and his last Campaign in the Spanish Peninsula and the South of France. 3 vols. 8vo. 16s.

*A valuable body of information upon the course of the British army in India, in Spain, and the South of France.—*Atlas.*

II.

Memoirs of General Count Rapp, First Aide-de-Camp to Napoleon. Written by Himself, and published by his family, containing a multitude of curious Facts and Anecdotes hitherto unknown. 8vo. 10s. 6d. ditto in French, 8s.

*What this work is highly interesting for is, the intimate knowledge it gives us of the character of the French soldiery and their leader. We have had several accounts of Bonaparte and his banishment, but Rapp saw him in the height of his prosperity, and in his trials, at the moment giving orders for battle, in action, in victory, in retreat.—*Times.*

III.

Journal of an Officer of the King's German Legion. An Account of his Campaigns and Services in the Peninsula, Sicily, Italy, Malta, England, Ireland, and Denmark. In 1 vol. post 8vo. 6s.

IV.

Adventures of a Young Rifleman in the French and English Armies, during the War in Spain and Portugal, from 1805 to 1816. Written by Himself. 8d edit. in 1 vol. small 8vo. 6s.

The Adventures of a Young Rifleman form one of the most entertaining romances we have of late years met with. We can truly say, that the Rifleman's confidence will afford, to every one that makes the experiment, a delightful evening, and a harvest of valuable recollections.—*Representative.*

V.

The Young Rifleman's Comrade; or, Narrative of his Military Adventures, Imprisonment, and Shipwreck. Printed uniformly with the "Adventures of a Young Rifleman." 1 vol. post 8vo. 6s.

VI.

Adventures of a Sergeant in the French Army, during his Campaigns in Italy, Spain, Germany, Russia, &c. from 1805 to 1822. Written by Himself. 1 vol. post 8vo. 6s.

*Robert Guillemaud, whose memoirs are here presented to the public, was drawn as a conscript in 1805. He was sent on board Admiral Villeneuve's fleet, and the man who shot Lord Nelson at the battle of Trafalgar; subsequently to which he witnessed the assassination of his own admiral, touching whose death he was personally examined by Bonaparte. He then joined the army in Germany, was present at the taking of Strasburg, and, marching into Spain, was made prisoner by a Guelfa party. Having made his escape, he was sent on the Russian campaign, and, at the battle of the Borodino, was taken by the Russians and banished to Siberia, where he remained in captivity till 1814, when he and a few others were suffered to return. At the time of Napoleon's re-appearance from Elba, Guillemaud was serving in the Duke of Angoulême's army in the south, and describes the massacre of the Protestants at Nîmes. Soon afterwards he assists Joachim Murat (King of Naples), in escaping from Toulon to Corsica. Guillemaud's final campaign was in Spain, in 1822, after which he retired to his native village, whence his memoirs are dated. The historical documents, published in the notes of this extraordinary recital, contain also some curious details hitherto unknown.

VII.

Vicissitudes in the Life of a Scottish Soldier, written by Himself. 1 vol. 12mo. 4s. 6d.

Mackenzie on the Eye.

In 1 large vol. 8vo. of 578 pages, 11s.

A COMPLETE PRACTICAL TREATISE ON THE DISEASES OF THE EYE.

By WILLIAM MACKENZIE,

Lecturer on the Eye in the University of Glasgow, and one of the Surgeons to the Glasgow Eye Infirmary.

*Mr. Mackenzie's work is decidedly the best and most comprehensive on the diseases of the eye ever published in this country, and will be of reference and standard authority. Such a work was much wanted, for there is nothing equal to it in our language. It is a work of great practical utility, and will find a place in every medical library.—*Medical and Surgical Journal*, Nov. 1, 1820.

The Index to this work is so full as to answer every purpose of an Ophthalmological Dictionary.

Printed for Longman, Rees, Orme, Brown, and Green, Paternoster Row.

Price 1s. 6d. No. IX. of

THE ENGLISH SCHOOL OF PAINTING and SCULPTURE, from the Days of Hogarth to the present Time, each containing six Plates accurately copied from the most celebrated English Engravings, with Descriptions.

By G. HAMILTON.

To be completed in Thirty-Six numbers, forming Three handsome volumes.

*A brief description will serve to give an idea of it. It consists of engravings in outline, with descriptions in French and English, of all the best paintings, sculptures, &c. of British artists; and of these, six are given for eighteenpence. Thus, Wilkie's Monday we have for threepence! We need not say how much the diffusion of this work will refine the general taste, and supersede low and vulgar prints.—*Glasgow Press.*

Charles Tilt, 85, Fleet Street.

Dr. Lingard's England complete.

Vol. VIII. in 4to. price 11. 15s. in boards, being the concluding Volume of

 EVENING; or, an easy Introduction for the Reading
 of the Bible. For the Use of Children.
 By the Author of the "Infant Christian's First Catechism."
 Printed for C., J., G., and F. Rivington, St. Paul's Churchyard,
 and Waterloo Place, Pall Mall.

In 12mo. price 6s. boards, or 6s. 6d. half-bound, the
Tenth Volume of
THE COTTAGER'S MONTHLY
VISITOR for the Year 1830.

This Work is published in monthly Numbers, price 6d. forming a copious Manual of Religious Instruction and Domestic Economy for the Poorer Classes, and is particularly adapted for the Use of Servants and Housewives. It contains a variety of interesting and useful Notices, and is accompanied by Familiar Letters on the History of England, useful Information upon Gardening and Agriculture, Selections from various Authors, Month's Extracts from the Bible, &c. together with a great variety of Miscellaneous Information.

Printed for C. J. G. and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

Price 6d. each half-bound.

L'HERMITE de la CHAUSSEE-
D'ANTIN; ou, Observations sur les Mœurs et les Usages
Français au Commencement du XIXe Siècle.
Par M. DE JOUY,
Membre de l'Académie Française. 2d édition.
Waugh and Innes, Edinburgh; and Whittaker, Treacher,
and Co. Ave Maria Lane, London.

Description of the PATENT METALLIC LINING and DAMPER, for the Chimneys of Dwelling and other Houses and Buildings, invented by Mr. SETH SMITH, of Wilton Crescent, Belgrave Square. Illustrated by Engravings.

London: Printed for Longman, Rees, Orme, Brown, and Green; and Carpenter and Son, Old Broad Street.

MAPS AND TABLES OF CHRONOLOGY

and GENEALOGY, illustrative of the History of Europe, revised and translated from Monsieur Koch's "Tableau des Révolutions de l'Europe," for the Use of Harrow School.

This work contains a new and different view to illustrate a course of Elementary Lectures on Modern History lately introduced at Harrow School; the Repetition of the Map of Europe, with the Principal Cities named, and a different view to the same effect, the Genealogy of the Royal Houses, and the Chronological Table from the Overthrow of the Western Empire, will render this work, it is hoped, a useful Companion to the works of Gibbon and Russell, of Mr. Hallam and Mr. Alison.

Price 2s. 6d.

THE EMPEROR'S ROUT; or, the Feast
of the Moths. A Companion to the celebrated "Butterflies' Ball." This poem is illustrated with Four correct and beautiful coloured Plates, and copious Entomological Notes.

 Author of *Leomora*, the *Poor Girl's Help*, *Private Education*,
Edgar, *Early Education*, the *Spring-Bud*, &c. &c.
 London: Printed for W. Simpkin and R. Marshall, Stationers' Hall Court.

Ireland in the Days of Elizabeth.
2d edition, in 8 vols. post 8vo. illustrated with Fac-simile
Autographs of the principal Characters,
GERALDINE of DESMOND; or, Ireland
in the Days of Elizabeth. An Historical Romance.
By MISS CRUMPE.

"A work which promises to hold a very distinguished rank on the list of historical romances. In fact, it may stand alone for individual excellencies peculiar to itself. Founded upon Irish annals, and descriptive of the most interesting and eventful period in the history of the sister country, it connects with the story of the romance family, the political record of the times of Elizabeth, and the domination of the English in Ireland, and the fate of the necks of the Irish people. The lover of romance will find in these pages wherewith to entertain his idle hours. The antiquary may learn much from the deep research displayed by the author on subjects connected with the customs of the native Irish of those times; and the politician and historian will be enabled to trace the causes of much that has occurred in our distracted country since its final conquest by the English queen."—*Oxford Herald*.

Hester Colburn and Richard Bentley, New Burlington Street.

In 18mo. price 6s. boards,
A TREATISE on the NATURE and
 CAUSES of DOUBT in RELIGIOUS QUESTIONS,
 (with a particular Reference to Christianity). With an Appen-
 dix on some common Difficulties, Lists of Books, &c. &c.

On Saturday the 26th of February, 1831, will be published, price
Threepence, the first Number (to be continued Weekly, also
in Monthly Parts) of

THE CHRISTIAN'S MAGAZINE; or
Weekly Miscellany of Religious Essays, Anecdotes,
Literature, Biography, Intelligence, and Poetry. The Christian
Magazine will consist principally of the following Articles—Original
and selected Essays on the Existence, Attributes, and Works
of God, the Truth of the Holy Scriptures, the Immortality of
the Soul, the Nature of the Sacraments, &c. &c. &c. &c. &c. &c.
Mediator—Illustrations of the Language, History, Geography,
&c. of the Bible, with Notices of its principal Translations—
Sketches of Ecclesiastical History, of the Introduction of Chris-
tianity into various Countries, and of the Societies for its Propaga-
tion in the present Age—The Ancient and Modern History of
the Christian Church, &c. &c. &c. &c. &c. &c. &c. &c. &c. &c. &c.
Details of such Events as are generally interesting to the Believers
of the World.

The Editor's constant endeavour will be to make the Christian
Magazine a repository for every thing that is instructive
and valuable in a religious point of view. It will contain, there-
fore, the most interesting and useful Essays, &c. &c. &c. &c. &c. &c.
History, the Literature, and the beneficial Effects of Christianity,
—with the single exception of Controversial Divinity, which must
necessarily be excluded, because the Magazine is intended for a
Protestant Christians who believe in the Atonement and Divinity

by Jesus, and intelligence are respectfully and earnestly solicited by the Editor; and each Contributor will be entitled to receive five Copies of the Number in which his contribution is printed. Woodcuts will be occasionally given; and a Frontispiece, title page, and Table of Contents, will accompany the last Number of each Volume.

Published by C. Richards, 100, St. Martin's Lane, Chancery Cross, London, where Communications to the Editor may be made; and sold by J. Nisbet, 21, Fleet Street; L. L. Nisbet and Sons, 160, Fleet Street; and all other Booksellers in the United Kingdom.

On Saturday next will be published, price 1s. Part 42 of
that unique Publication,
THE OLIO, embellished with Four beautiful
Engravings.

No. 174 is published this day, price 3d.
Vol. VI. is ready for delivery, price 8s. 6d.
A few complete Sets may be had.
Published at 15, Wine Office Court, Fleet Street; and by
all Booksellers and Newsvenders.

Hone's Edition of Strutt's Sports and Pastimes.

Now publishing in Weekly Parts, price, in demy 8vo. 1s. each Part; on royal drawing paper, 3s. each Part; and on extra drawing paper, with the Engravings coloured, 3s. each Part.

THE SPORTS AND PASTIMES of the
PEOPLE of ENGLAND; including the Rural and Domestic Recreations, May Games, Mummings, Shows, Processions, Pageants, and Pompous Spectacles, from the earliest period to the present time.

By JOSEPH STRUTT.

Journal of Belles Lettres, Arts, Sciences, &c.

This Journal is supplied Weekly, or Monthly, by the principal Booksellers and Newsmen, throughout the Kingdom; but to those who may desire its immediate transmission, by post, we recommend the LITERARY GAZETTE printed on stamped paper, price One Shilling.

No. 736.

SATURDAY, FEBRUARY 26, 1831.

PRICE 8d.

REVIEW OF NEW BOOKS.

The Effects of the principal Arts, Trades, and Professions, and of Civic States and Habits of Living, on Health and Longevity: with a particular reference to the Trades and Manufactures of Leeds; and Suggestions for the Removal of many of the Agents which produce Disease, and shorten the Duration of Life. By C. Turner Thackrah. 8vo. pp. 126. London, 1831, Longman and Co.; Leeds, Baines and Co.

"This paper (says the author in his conclusion) has proved much longer than I expected; and its details, I fear, have been often tedious and desultory. There has been a frequent repetition of facts and opinions,—sometimes from design, often from oversight. For the time I have now neither time nor inclination. Careless of criticism, and indifferent to literary reputation, I have sought to be useful. The uncertainty of life, and the sense of responsibility, urge us to spend our short-lived day less in matters of taste and refinement, than in pursuits which we believe calculated to relieve human suffering, and promote human happiness."

Useful in an eminent measure do we consider Mr. Thackrah's inquiries and publication calculated to be. Practical research has led him to an accumulation of facts at once curious in themselves, and vitally interesting to every living being; for though confined to Leeds and its vicinity, the results apply to every part of the country, and to every condition of life. "If we look immediately at home (he says), we observe the wonders which science and art have effected. We see large buildings, manufactures of almost every kind, and substances, changed, reformed, and combined, that nature could scarcely know her own productions. We admire the inventions of science, alike in their minuteness and their size, their accuracy, and their extent of operation. We see wool converted into cloth in establishments so numerous and extensive as almost to supply the civilised world: we see the slight blue-flowered product of the field formed, in the same mill, into the thread which passes through the eye of the needle, and into the canvass which bears our ships to every region of the globe: we see rough and massive minerals drawn from the bowels of the earth, converted, on the one hand, into instruments which surpass in power the united strength of the largest animals, and on the other, formed into the finest and most delicate pieces of mechanism. These, and works like these, are assuredly wonderful. But while we admire, let us examine. What are the effects of these surprising works—efficiency, I mean physical and moral? I say nothing of the wealth they produce, or have produced—for wealth is good or evil according to its application: I refer to the health of fifty thousand persons who spend their lives in the manufactories of Leeds and its neighbourhood, in its allied and dependent occupations. I ask, if these fifty thousand persons enjoy that

vigour of body which is ever a direct good, and without which all other advantages are comparatively worthless? I ask, if the duration of life is as great here as in the agricultural districts? To the first inquiry, the mere appearance of our population affords a reply. Take indifferently twenty well-fed husbandmen, and compare them with twenty manufacturers who have equal means of support, and the superiority of the agricultural peasants in health, vigour, and size, will be obvious. Medical men, moreover, have daily proof of the ill effects on the human constitution which our employments produce. They find a number, a variety, and a complexity of diseases, which are little known in country practice, and which, though not directly fatal, greatly reduce the powers of life. The second inquiry will be most satisfactorily answered by reference to the bills of mortality. In the returns of population for the year 1821, as taken according to the act of parliament, we find the following statement in reference to the three Ridings:—

Allowing 20,000 persons in each Riding, there were living in 1821—

	E. R.	N. R.	W. R.
Under 5 years of age	2870	2775	3281
5 to 10	2573	2543	2768
10 — 15	2260	2231	2370
15 — 20	1977	1990	2083
20 — 30	3079	2914	3098
30 — 40	2306	2208	2267
40 — 50	2007.4	1843.7	1702.3
50 — 60	1393.3	1420.3	1204.5
60 — 70	914.0	1103.7	815.3
70 — 80	474.4	629.6	377.9
80 — 90	135.7	308.6	94.22
90 — 100	8.6	20.48	7.43
100 and above	.42	.83	.09

This table does not shew the proportion of children who die under the age of five years; but on other periods its bearings are important. We find that though the number of children living at the time of the calculation is considerably greater in the West than in the other Ridings—about six of the first class in the West to five of the same class in the North—the disparity gradually diminishes as we proceed to the succeeding classes; in other words, we find that considerably more persons die before they arrive at manhood in the West Riding, than in the North or East. As we advance further, we observe that in the ages between forty and fifty the scale turns still more evidently against the West; for though, as we know from other sources, the births in the West Riding considerably exceed those of each other of the Ridings, the number of persons between the age of forty and fifty is actually less in the West than in either the North or East. The same decreasing ratio we find to continue till we arrive at the term 80—90; and though the estimate of more advanced periods is, probably from the comparative paucity of numbers in the returns, rather irregular, yet the West Riding is still below either of the others. It is therefore evident that the duration of human life is considerably less in the West Riding, the manufacturing district, than in other parts of Yorkshire. To come more immediately home,—let us compare the mortality in Leeds with that of a town

destitute of manufactures, and afterwards with that of a merely agricultural district. I take at random Ripon and Pickering Lythe. In 1821 the population of the town and borough of Leeds was 83,796, and the burials were 1516, or one death in 55 persons. In the liberty of Ripon at the same time, the population was 12,131, and the burials were 180, or one death in 67½. But Ripon being subject, in a degree at least, to the evils of a town, we are required to compare the mortality at Leeds with that of an agricultural district, where the people and their habitations are not crowded. Pickering Lythe returned in 1821 a population of 15,232, and the number of burials 205; one death consequently in 74 persons. Taking, then, the mortality at Pickering Lythe as the natural one, there was an excess of 321 deaths in the borough of Leeds during the year 1821. And allowing for the increase of population since that period, we may fairly say that at least 450 persons die annually in the borough of Leeds, from the injurious effects of manufactures, the crowded state of population, and the consequent bad habits of life. We may say that every day of the year is carried to the grave the corpse of an individual whom nature would have long preserved in health and vigour;—every day we see sacrificed to the artificial state of society, one, and sometimes two victims, whom the destinies of nature would have spared. The destruction of 450 persons year by year in the borough of Leeds cannot be considered by any benevolent mind as an insignificant affair. Still less can the impaired health, the lingering ailments, the premature decay, mental and corporeal, of nine-tenths of the survivors, be a subject of indifference. Assuredly, an examination into the state of our manufactures has long been demanded, alike by humanity and by science. The object of this paper is to excite the public attention to the subject. Myself and my pupils have personally and carefully inspected the state of the artisans in most kinds of manufacture, examined the agencies believed to be injurious, conversed on the subject with masters, overlookers, and the more intelligent workmen, and obtained many tables illustrating the character of the disorders prevalent in the several kinds of employ. From these sources collectively, I have drawn up statements, which, though avowedly imperfect, must, I conceive, approach to the truth."

Mr. Thackrah then goes into his striking details, dividing, for that purpose, the population into four great classes of operatives, dealers, master-manufacturers and merchants, and professional men; and examining "the atmosphere they breathe—the muscular exercise they take—the postures of body they maintain—the variations of temperature and humidity to which they are exposed—their diet and habits of life; and finally, in some classes, their state of mind." We will display some of the results in almost a tabular form.

OUT OF DOORS.

"Butchers, and the slaughtermen, their

wives, and their errand-boys, almost all eat fresh-cooked meat at least twice a-day. They are plump and rosy. They are generally also cheerful and good-natured. Neither does their bloody occupation, nor their beef-eating, render them savage, as some theorists pretend, and even as the English law presumes. They are not subject to such anxieties as the fluctuations of other trades produce—for meat is always in request; and butchers live comfortably in times as well of general distress as of general prosperity. They are subject to few ailments, and these the result of plethora.* Though more free from diseases than other trades, they, however, do not enjoy greater longevity; on the contrary, Mr. T. thinks their lives shorter than those of other men who spend much time in the open air.†

Cattle and horse dealers are generally healthy, except when their habits are intemperate.

Fishmongers, though much exposed to the weather, are hardy, temperate, healthy, and long lived.

Cart-drivers, if sufficiently fed and temperate, the same.

Labourers in husbandry, &c. suffer from a deficiency of nourishment.

Brickmakers, with full muscular exercise in the open air, though exposed to vicissitudes of cold and wet, avoid rheumatism and inflammatory diseases, and attain good old age.

Chaise-drivers, postillions, coachmen, guards, &c., from the position of the two former on the saddle, irregular living, &c., and from the want of muscular exercise in the two latter, are subject to gastric disorders, and, finally, apoplexy and palsy, which shortens their lives.

Carpenters, coopers, wheelwrights, &c. healthy and long lived.

Smiths, often intemperate, and die comparatively young.

Rope-makers and gardeners suffer from their stooping postures.

Poivers, subject to complaints in the loins, increasing with age, but they live long.

IN-DOOR OCCUPATIONS.

Tailors,† notwithstanding their confined atmosphere and bad posture, are not liable to acute diseases, but give way to stomach complaints and consumption. "It is apparent, even from observing only the expression of countenance, the complexion, and the gait, that the functions of the stomach and the heart are greatly impaired, even in those who

* Butchers (he says) in fact live too highly—not too highly for temporary health, but too highly for long life. Is every man gifted at birth with a portion of the pabulum of life, which he cannot increase, but which he may prematurely consume;—in other words, does nature endow us with a vital patrimony, which we may exhaust, not only by profligate indulgence, but even by regular draughts too frequently repeated? Or rather, does not high living (for I speak not at present of excess or intemperance)—does not high living produce that plethoric state which gradually leads to disease? I believe the latter. Congestion of blood, affecting chiefly the vessels of the abdomen and head, shortens the lives of numbers who are plump, rosy, and apparently strong. My very intelligent friend, Dr. Murray, of Scarborough,† he adds, "concurs in the statement relative to butchers." "The high living of butchers assuredly leads to plethora and premature dissolution." He adds:—"Thus coal-meters, &c. of London, rarely, if ever, attain the age of forty, though men remarkable for muscular bulk and strength. They work most laboriously, perspire immensely, and supply such waste by extraordinary and almost incredible portions of porter, which ultimately, without much positive and actual intemperance, brings on irregularities of the digestive system, structural changes, and death."

† On the bent postures, which Mr. T. considers so injurious, we may remark, that a French physiologist has just published a memoir, in proof that the spinal marrow has, properly speaking, no special action upon the circulation distinct from the general action of nervous centres, and that it is not in it that the essential principle, still less the exclusive principle, of the circulation resides.

consider themselves well. We see no plump and rosy tailors; none of fine form and strong muscle. The spine is generally curved: the reduction in the circumference of the chest is not so much as we might expect; the average of our measurements presented 33 to 34 inches, while that of other artisans is about 36. The capacity of the lungs, as evinced by measuring the air thrown out at an expiration, is not less than common: the average of six individuals was 7½ pints. The prejudicial influence of their employ is more insidious than urgent—it undermines rather than destroys life. • • •

Of twenty-two of the workmen employed in Leeds, not one had attained the age of sixty; two had passed fifty; and of the rest, not more than two had reached forty. We heard of an instance or two of great age; but the individuals had lived chiefly in the country.†

Staymakers have their health impaired, but live to a good average.

Milliners, dress-makers, and straw-bonnet-makers, are unhealthy and short lived.

Spinners, cloth-dressers, weavers, &c. &c., are more or less healthy, as they have exercise and air. Those exposed to inhale imperceptible particles of dressings, &c., such as frizers, suffer from disease, and are soonest cut off.

Shoemakers are placed in a bad posture:—"Digestion and circulation are so much impaired, that the countenance would mark a shoemaker almost as well as a tailor. We suppose that, from the reduction of perspiration and other evacuations, in this and similar employments, the blood is impure, and consequently the complexion darkened. The secretion of bile is generally unhealthy, and bowel complaints are frequent. The capacity of the lungs, in the individuals examined, we found to average six and one-third, and the circumference of the chest thirty-five inches. In the few shoemakers who live to old age, there is often a remarkable hollow at the base of the breast-bone, occasioned by the pressure of the last."

Curriers and leather-dressers are very healthy, and live to old age.

Saddlers lean much forward, and suffer accordingly from headache and indigestion.

Printers (our worthy co-operators) "are kept in a confined atmosphere, and generally want exercise. Pressmen, however, have good and varied labour. Compositors are often subjected to injury from the types. These, a compound of lead and antimony, emit, when heated, a fume which affects respiration, and are said also to produce partial palsy of the hands. Among the printers, however, of whom we have inquired, care is generally taken to avoid composing till the types are cold, and thus no injury is sustained. The constant application of the eyes to minute objects gradually enfeebles these organs. The standing posture long maintained here, as well as in other occupations, tends to injure the digestive organs. Some printers complain of disorder of the stomach and head; and few appear to enjoy full health. Consumption is frequent. We can scarcely find or hear of any compositor above the age of fifty. In many towns printers are intemperate."

Bookbinders—a healthy employment.

Carvers and gilders look pale and weakly, but their lives are not abbreviated in a marked degree.

Clockmakers, generally healthy and long-lived.

Watchmakers, the reverse.

House-servants, in large, smoky towns, unhealthy.

Colliers and well-sinkers, a class by themselves, seldom reach the age of fifty.

EMPLOYMENTS PRODUCING DUST, ODOUR, OR GASEOUS EXHALATIONS.

If from animal substances not injurious; nor from the vapours of wine or spirits.

Tobacco-manufacturers do not appear to suffer from the floating poison in their atmosphere.

Snuff-making is more pernicious.

Men in oil-mills, generally healthy.

Brushmakers live to very great age.

Grooms and hostlers inspire ammoniacal gas, and are robust, healthy, and long-lived.

Glue and rice boilers, exposed to the most noxious stench, are fresh-looking and robust.

Tallow-chandlers, also exposed to offensive animal odour, attain considerable age.†

Tanners, remarkably strong, and exempt from consumption.

Corn-millers, breathing an atmosphere loaded with flour, are pale and sickly: very rarely attain old age.

Malsters cannot live long, and must leave the trade in middle life.

Tea-men suffer from the dust, especially of green teas; but the injury is not permanent.

Coffee-roasters become asthmatic, and subject to headache and indigestion.

Paper-makers, when aged, cannot endure the effect of the dust from cutting the rag. The author suggests the use of machinery in this process. In the wet, and wear and tear of the mills, they are not seriously affected; but live long.

Masons are short lived, dying generally before forty. They inhale particles of sand and dust, lift heavy weights, and are too often intemperate.

Miners die prematurely.†

Machine-makers "seem to suffer only from the dust they inhale, and the consequent bronchial irritation. The *filers* (iron) are almost all unhealthy men, and remarkably short-lived."

Founders (in brass) "suffer from the inhalation of the volatilised metal. In the founding of yellow brass, in particular, the evolution of oxide of zinc is very great." They seldom reach forty years.

Copper-smiths "are considerably affected by the fine scales which rise from the imperfectly volatilised metal, and by the fumes of the 'spelter,' or solder of brass. The men are generally unhealthy, suffering from disorders similar to those of the brass-founders."

"*Tinplate-workers* are subjected to fumes from muriate of ammonia, and sulphureous exhalations from the coke which they burn. These exhalations, however, appear to be annoying rather than injurious; as the men are tolerably healthy, and live to a considerable age. *Tinners* also are subject only to temporary inconvenience from the fumes of the soldering."

"*Plumbers* are exposed to the volatilised oxide of lead, which rises during the process of 'casting.'" They are sickly in appearance, and short-lived.

House-painters are unhealthy, and do not generally attain full age.

Chemists and druggists, in laboratories, are sickly and consumptive.

Potters, affected through the pores of the

* "During the plague in London it was remarked that this class of men suffered much less than others."

† "Last year, there were in the village of Arkent (in the heart of the mining district) not less than three widows under thirty years of age. The prevalent malady appear to be affections of the lungs and bowels. Smelting is considered a most fatal occupation. The appearance of the men is haggard in the extreme."

skin, become paralytic, and are remarkably subject to constipation.

Hatters, grocers, bakers, and chimney-sweepers (a droll association), also suffer through the skin; but though the irritation occasions diseases, they are not, except in the last class, fatal.

Dyers are healthy and long-lived.

Brewers are, as a body, far from healthy. "Under a robust and often florid appearance, they conceal chronic diseases of the abdomen, particularly a congested state of the venous system. When these men are accidentally hurt or wounded, they are more liable than other individuals to severe and dangerous effects."

Cooks and confectioners "are subjected to considerable heat. Our common cooks are more unhealthy than housemaids. Their digestive organs are frequently disordered, they are subject to headach, and their tempers rendered irritable."

Glass-workers are healthy; *glass-blowers* often die suddenly.

With this ends Mr. Thackeray's examination of the first great division—the *labouring classes*; and here for the present we must pause, reserving the other parts, and very important they are, for a second notice.

The Tuileries: a Tale. By the Author of "Hungarian Tales," "Romances of Real Life," &c. 3 vols. 12mo. London, 1831. Colburn and Bentley.

THESE are three very delightful volumes, if the term delightful may, even in a literary sense, be applied to annals of such crime and suffering as those whose scenes are laid in the French revolution. We remember being much pleased with Mrs. C. Gore's early productions, of which French history furnished the *material*. The *Lettre de Cachet* was a very interesting tale. Since then, we think her style has considerably improved: her stories are more simple, and her characters better developed. The present romance is one of that life so real and so terrible, a few years ago, when the best and the worst feelings of our nature were called into play,—when the thirst of blood was an absolute disease, and the horror of the times could only be equalled by their absurdity. The story of the *Tuileries* is rendered very attractive, by private sorrows being mingled with public calamities; while our interest, fixed on individuals, becomes more active by being concentrated. Is it weakness, or is it selfishness, that makes us sympathize so much more with the sorrows of the few than of the many? Mrs. Gore has given a great air of reality to her scenes. Euphrosine is a true portrait in the troubled times that produced a *Charlotte Corday*; and the two cousins are brought into good contrast. A romance is something like a journey; we can scarcely give a just idea of its progress by one scene of it; still, as one prospect tempts to another, we must try. We select, first, one from a brilliant representation at Trianon.

On the entrance of a group of lovely children into the stage-box, a murmur arose from the part of the theatre in which he sat, of "Vive Monseigneur le Dauphin—Vive Madame!" At the suggestion of Madame Mackau, their sub-governess, these infantine representations of royalty gracefully acknowledged the applause which greeted their arrival; while the eyes of Camille remained riveted upon their

box. Mademoiselle Euphrosine, observant of the air of interest with which he gazed on the 'Children of France,' and believing it to be excited by the delicate appearance of the young dauphin, immediately began a loyal lamentation over the unfortunate feebleness of constitution evinced by the heir to the throne; mingled with a refutation of the vulgar opinion that he did not share the affections of his mother equally with Madame Royale and the Duc de Normandie. But it was not the Dauphin's precarious condition, nor the imputed alienation of the queen's attachment, which absorbed the earnest attention of Camille Valazy. Several children of the nobility had been admitted into the royal box; and among them, a fairy girl, with long glossy brown curls overhanging her little shoulders, whom Camille could have avouched that he had carried a thousand times in his arms, and bestowed a thousand kisses on those waxen cheeks, which afforded a faultless model of infantine beauty. 'It is Emiline!' he murmured—'my own Emiline!' 'It is in truth the little Emiline de St. Florentin,' observed the astonished Euphrosine; but she had no time for farther explanations. The curtain at that moment drew up, and discovered Marie Antoinette in all the graceful splendour of that youthful beauty, which affliction had not yet 'clawed within his clutch'; her glistening hair was not yet blanched by the vigils of anxious sorrow, nor her clear blue triumphant eyes sullied by tears of humiliation. Her dress was adjusted with the perfection of elegance which was one of her sins in the eyes of the cavilling multitude; and even the costume of her attendant was of the choicest fashion; for that attendant was the Marquise de St. Florentin. 'Mamma! my dearest mamma!' exclaimed the startled cherub of the stage-box, clapping her little hands in uncontrollable ecstacy; while, notwithstanding the prolonged *et, et*, resounding through the house, every spectator sympathised in the affectionate rapture of the delighted child."

Our next is of a very different kind.

"Valazy could not trust himself to look! he felt that the total extinction of his hopes of saving the unfortunate Euphrosine would be too much for endurance; and resolved to wait patiently the event. *Patently!*—to witness patiently the immolation of shrieking women,—of Christian priests,—of aged men,—guiltless of all crime, save that of nobility of birth, or nobleness of fidelity towards the cause of their hereditary sovereign.—*Patently!*—Alas! his very reason appeared impaired by the excesses he was compelled to witness;—his eyes rolled wildly in their sockets—his tongue cleaved to the roof of his mouth when he attempted to join in the ferocious clamour of the shouting multitude—and his compressed lips were parched as by a burning fever. 'I cannot longer endure this agony!' he exclaimed, panting for breath. 'Let me die!—let me die! and close my eyes on this scene of horror and infiquity!' 'Nay,' cried his companions, misinterpreting the motive of his ejaculation; why not suffer the wound to be properly dressed at once?—and though in truth these vile aristocrats are a disgusting spectacle, dost thou not see that every half hour delivers us from half-a-dozen of the gang?—But hush! the wicked opens—a woman, too!—a woman who might be young and pretty, were she not as worn and thin as one of the hatchets yonder.' 'How deadly white are her face and arms!—the terrors of conscience!' 'That sackcloth garment supplied by the prison to its pauper-inmates, is somewhat different, I suspect, from the robe in

which the Sardinian princess will make her appearance.—Aha! our wounded friend pushes forward now,—he wishes to have a touch at this lamb of the fold.' 'Hush! the sentence!' cried several of the mob, who were somewhat interested by the youthful and humiliated air of a girl unrecognised by any among them as belonging to the obnoxious aristocracy. Even the soldiers seemed to pause before they pronounced the fiat of destiny on their pale and shrinking victim. A dead silence again prevailed. '*A l'Abbaye!*' roared out the elder of the two guards. '*A l'Abbaye!*' re-echoed the crowd; and already the executioners approached with their uplifted weapons,—from which Euphrosine Delplanque recoiled not, nor uttered the faintest cry of alarm. Her soul was concentrated in prayer! 'No, do not strike!' cried one of the assassins, interposing a bleeding arm between them and their victim. 'You owe me some recompense for this accursed gash;—give me the woman for my prize.' 'No, no; strike!—rid me of my miserable existence!' cried Euphrosine, roused to a consciousness of their proceedings, and sinking upon her knees. 'Nay, girl, thou wert but too well off to save thy life by becoming mate to a good patriot!' exclaimed the old soldier, to whose knees she was clinging. 'Up, and thank him for his mercy.' 'Let me die! let me die!' shrieked the agonised prisoner. 'Give me not into the hands of this wretch. Man!' she persisted, folding her arms round her executioner, 'you are old—your hairs are gray!—I have an aged and gray-headed father—for his sake—for the sake of his sorrow—kill me at once rather —' 'No more of this raving!' cried another of the miscreants; 'let her die at once,—it is her sentence. Let her join the goodly company in yonder heap,' and he swung round his axe to insure a steadier aim, but was again interrupted by his comrade. 'Friends!' cried Camille, turning to the mob, 'it is for you to decide. My wounds should purchase, methinks, the goodwill of my fellow-patriots;—do you adjudge me this whimpering fool to be my house-drudge?' 'Ay, ay, *sans phrase!*' cried the foremost of the populace. 'She seems to hate thee worse than the axe;—and so take her, and break her stubborn neck in thine own way.' Euphrosine had fallen insensible on the ground at this horrible sentence; but Camille, recovering all his strength in such a crisis, snatched her from the earth; and flinging her across his shoulder, forced his way through the mob, who greeted him with acclamations and shouts of laughter for what they conceived to be a project of further evil. Bewildered,—oppressed,—but with the vague consciousness of triumph uppermost in his thoughts, he staggered through several adjacent streets,—still fancying that the avengers of blood were behind him—that the assassins of La Force would overtake him, and wrest his unhappy victim from his arms;—and with increased eagerness pressed onwards to get beyond the reach of the echoing shouts of the fatal *huaille*. Remembering the obscure passage he had traversed early in the evening, Camille now bent his course thither, in hopes of finding it deserted, and obtaining a moment's pause for consideration. But he beheld it crowded with persons gathered together in terrified inquiry touching the progress of events at La Force; among whom his wild and distracted appearance, and the figure he held in his arms, with her long black tresses entangled round her, excited observation and suspicion. He would have given worlds to shelter and succour the unfortunate being he had rescued

•• The ill-smell of brown is, however, evidently due to their habitual and unnecessary potation of tea. There is no reason to believe them injured by their *supper*.

from a cruel death; but every house was closed for the night which might have opened to receive two persons of an appearance so suspicious;—nor did he dare encounter the scrutiny of any frequented part of the city. At length his exertions enabled him to reach a stand of *fiacres*; and in a few minutes he found himself jolting towards his own home, with Euphrosine still lying senseless upon his shoulder."

The history of France is a peculiarly rich field for the romance writer; and Mrs. Gore's present performance is a very successful effort. The dialogues are uncommonly characteristic and spirited.

A Year in Spain. By a Young American. 2 vols. 12mo. London, 1831. J. Murray.

OUR young American, Lieutenant Alexander Slidell, of the navy, is a very lively and pleasant travelling companion. He has been long enough in Spain to see a great deal of the country, and he has mixed sufficiently with them to know a great deal of the people. The vivacity of youth gives spirit to his views, and an evident store of good humour imparts animation to all that he has observed and relates. He is no pretender to high and fashionable intercourse; and does not bore us with accounts of the *fêtes* to which he was invited, the fine folks whom he met, or the extraordinary distinctions he received: on the contrary, he was resolved to make himself acquainted with Spain, and the manners and customs of its population, and, like a stout and sensible sailor, he *roughed it*. Without a superabundance of cash, to tempt the robber or murderer, he trusted himself to the same routes, conveyances, lodgings, and accommodations, with the natives; and, though not without his share of escapes, he seems to have drawn a faithful as well as a striking picture of the scenes which he witnessed. His work has, we believe, been also published in America; where we have no doubt national feelings will not diminish the popularity of an author who justly deserves to be popular in both hemispheres. With these few remarks we shall allow him to speak for himself, though, to confess the truth, we have been somewhat anticipated by an anticipatory and well-written review in the *Quarterly*, in which the personal adventures of the gallant lieutenant are brought forward in a style worthy of his countryman, Washington Irving. It is a fact, that when two persons ride on the same horse, one of them must ride behind; all we can do, therefore, is to ride as well as we can on the crupper. Passing over the journey, behold us then in the capital, and taking a drive on the Prado, the Mall of Madrid.

"The vehicles, to the number of several hundreds, are of every variety, among which are elegant carriages of the diplomatic corps of the most modern construction, with a liveried coachman and Swiss footman, flanked by a *chasseur* with a pair of *epaulettes*, a hunting sword, and cocked hat surmounted with green feathers. Most of the carriages, however, are in the old Spanish style, not very different, indeed, from the first one used in Spain, by the good, or good-for-nothing queen Joana the Foolish. The body is square and formal, ornamented in a sort of Chinese taste, and is not unlike a tea-chest. This body is sustained by leathern straps, whose only spring is derived from their great length; for which purpose they are placed at such a distance from each other, that they scarce seem to be parts of the same vehicle. As these primitive carriages were built in remote ages, long before the invention

of folding steps, the ascent and entrance to them is facilitated by a little three-legged stool, which dangles by a strap behind, and which, when the carriage stops, the footman hastens to place in readiness beside the door. This singular vehicle is usually drawn by a pair of fat and long-eared mules, with manes, hair, and tails fantastically cut, driven by a superannuated postilion, in formidable jack-boots and not less formidable cocked hat of oil-cloth. When I looked at an equipage of this kind, I could scarce persuade myself that the coach, the mules, and the postilion, had not existed always, and would not continue for ever to make each day the circuit of the Prado. Such is the Saloon, and such the Prado. Nothing, indeed, can be finer than the range of the eye from the fountain of Cybele, on the afternoon of a feast day. At your back is the gate of Recoletos, standing at the extremity of a double avenue of trees; on the right is a hill ascending by the street of Alcalá towards the Gate of the Sun; on the left, the same street making a second ascent, and terminated by the noble arch of triumph. The whole road is thronged with soldiers in varied uniforms, and people in picturesque costumes, from the various provinces of Spain. The saloon, too, is thronged to overflowing, whilst in the distance are partially discovered the museum and botanic garden through the vistas of the trees; and in the interval, Neptune, half concealed by the spray thrown up before him, is seen urging his watery steeds. At such a moment the arrival of the king, surrounded by a pageantry scarce equalled by any court in Europe, serves to crown the splendour of the spectacle. His coming is first announced by drum and trumpet, as he passes the various guard-houses which lie in the way, and presently by the arrival of an *avant-courier*, who rides forward without looking to either side, in the road which his master is to follow. Next comes a squadron of young nobles of the body-guard, mounted on beautiful horses from the royal stables, which are chiefly of the cast of Aranjuez; and immediately after a gilded carriage drawn by six milk-white steeds, covered with plumes, and with manes and tails that are full and flowing. They are mounted and controlled by postilions, richly dressed in jockey suits of blue and gold. Within, the Catholic king is discovered seated on the right, conspicuous by his stars, his blue scarf, and the golden fleece which flangles from his neck. He glances round on the multitude with a look of mingled rapture and good humour, and salutes them mechanically by putting his hand up towards his nose and taking it down again, as though he were brushing the flies away. At his left is the queen, looking too good for this wicked world. Next comes Don Carlos, the heir apparent, drawn by six cream-coloured horses, more beautiful than those of his brother. He grins horribly through his red mustaches, and frightens those whom he intended to flatter. Beside him is his wife, a large coarse woman, with heavy beetling eyebrows. In the third coach is Don Francisco and his wife, drawn by six noble blacks. In the fourth the Portuguese, with her young son Don Sebastian; after which come some four or five carriages, each drawn by six mules, and which contain the lords and ladies in attendance. The whole is numerously escorted by cavaliers of the body-guard, and grooms from the royal service. The arrival of the royal family, like the passing of the host, or the tolling of the angelus, usually arrests every one in the situation in which it may find him. The line between the carriages is at once cleared, through the exertions of the

cavalry, and the vehicles on either side pause until their majesties have passed. Those who are walking turn their faces towards the road; the gentlemen unroll the *embozo* of their cloaks, and take their hats off, whilst the women shake their fans in passing salutation."

The writer gives a curious account of the multitude of beggars of every kind who infest every quarter of Spain. Among the rest he says—

"The most singular instance of mendicity I have ever seen was furnished by a couple whom I one day met in the Red San Luis. The principal personage was a large blind man, whose eyelids were turned up and fiery, and who carried upon his shoulders a most singular being, with an immense head and a pair of thin elastic legs, which were curled and twisted round the neck of his companion. The fellow overhead carried a bundle of ballads, which both were singing at the top of their lungs. Behind them came a patient ass, tied to the girdle of the blind man, and loaded with their effects, as though they were passing through on their way to some other place, or were coming to make some stay in the capital. They seemed to manage very well by thus joining their fortunes; for, whilst the blind man effected their locomotion, the cripple shaped their course, jesting with the other beggars and blind men whom they met, and holding out his hat to receive the offering of the charitable. Their bodies were indeed so twisted and entangled as to give at first the idea of a single being, forming a combination almost as monstrous as the fabled one of the Centaur."

Lotteries are also a general pest in Spain; and the following is a strange speculation:—

"Before quitting this subject (says Lieutenant S.) it may be well to give some account of a minor lottery which exists in Madrid, and which may be considered a miniature of the *loteria moderna*, inasmuch as the tickets, instead of selling for two dollars, cost but as many *cuartos*. This is the Hog Lottery. It is held at one corner of the Puerta del Sol, opposite the church of Buen Suceso. There, a *memorialista* has his little pent-house, placed against the wall of the corner shop, and carries on the business of selling the tickets. As the *memorialista* is a very important personage in Spain, it may not be amiss to say, that his employment is to copy documents and write letters, or draw up petitions, with a due observance of the forms and compliments in use among his countrymen. As he is far too poorly paid to be at the expense of a regular office, he is content with a small wooden box, to which he bears the same relation that a tortoise does to its shell, which may be moved about with him at pleasure, and which he is allowed, for a trifle, to set down against a wall or in a courtyard. But the *memorialistas* are by no means such transitory beings as this facility of locomotion might imply. Indeed, to look on one of them, seated in his little tenement, half hidden under an old cocked-hat and black cloak, as thin as a cobweb, and busily employed in forming antique characters upon Moorish paper, with a pen old enough to have served Cide Hamete Benengeli in writing the life and actions of Don Quixote, and ever and anon pausing and placing his pen over the right ear, whilst he warms his fingers or lights his cigarillo at the chafing-dish of charcoal beside him—when one sees this, I say, he can scarce believe that the *memorialista* has not been thus occupied for at least a century. The most frequented stand of these humble scribes is in the rear of the Casa de Correos. Here they are

ready throughout the day to do whatever may be required of them, more especially to expound letters just received by the post, and to indite answers for such unlearned persons as can neither read nor write—a class sufficiently numerous in Spain. They also muster in force about the purlieus of the palace, to draw up petitions for those who have business with the king, his ministers, or with the servants of his household. In truth, the memorialista is indispensable in Spain; for no business of any kind can be done there without the intervention of a memorial, or, as it is more frequently called in the diminutive, with a view perhaps to shew the modesty of the supplicant—a *memorialito*. To return to the Gate of the Sun, whence we have so unwittingly wandered; the memorialista in question was, like the rest of his fraternity, a threadbare, half-starved man, who sat all day in his humble pent-house, selling the tickets of the hog-lottery. He always looked cold and torpid in the morning, thawing gradually towards noon, when the sun got from behind the portal of Buen Suceso. It was then, too, that the idle frequenters of the Gate of the Sun began to gather round him, either to take tickets, or to praise the good qualities of the hog, who reposed upon straw in a second shed beside that of his master. This they might well do, for the animal was always a choice one. In fact, the breed of hogs in Spain is the finest in the world, unless, perhaps, their equals may be found in Africa, whence they came, for aught I know, though Mahomet was no pork-eater at the time of the conquest. The hog chosen as a subject for the lottery was always black without any hair, and enormously fat, having dimples in every direction, such as are to be found about the neck and chin of many a 'stout gentleman.' His legs were short, thin, and sinewy, with a well-made head and curly tail. The price of tickets in the hog-lottery is such as to exclude no one, however poor—so that even the mendicants can take a chance. This is especially the case with the blind men, who, as we have already seen, fare better in Spain than the rest of the beggarly fraternity. When one of these happened to pass through the Gate of the Sun, he almost always went towards the lottery, winding his way dexterously through the crowd until he reached the hog-pen: he would then feel round with his staff for the occupant, and when he had reconnoitred him sufficiently, straightway give him a poke under the shoulder, to try if he squealed well; for these poor fellows have a thousand ways of finding out things that we know nothing about. If the result answered his expectations, he came up behind and scratched him, tickled his ribs, and then twisted his tail until he squealed louder than ever. This done, to pacify the irritated and now clamorous memorialista, he would go at once and select a number of tickets. When all are thus sold, the lottery draws, with proper solemnity, and the successful player, well consoled for the jokes and gibes of the disappointed multitude, moves off in triumph with his prize."

(To be continued.)

Summer and Winter Hours. By Henry Glassford Bell. 8vo. pp. 174. London, 1831, Hurst, Chance, and Co.; Edinburgh, Constable.

SOME brief but delightful snatches of poetry; feelings, the tender and the dreaming, which may grow more wise in after years, but not more beautiful; thoughts, or rather imaginations, for they are as yet winged and wild; fancies, some sad, some playful; little touches

of nature, which shew the writer has wandered through the green wood with a poet's eye;—such, flowing in most musical verse, are the contents of this slight volume, which is full of

"The fragrance of the summer,
Though summer is gone."

Mr. Bell says, in his preface: "The author was desirous of publishing a selection of his fugitive pieces, more as an intimation of his poetical existence than as any attempt to prove himself entitled to the highest honours of the Muse. If he live, he will put his capabilities as a poet to a more ambitious and arduous test." The present work is one of most kindly promise: but let our readers judge for themselves.

"A Meeting sadder than a Parting.

Thou needst not thus have mock'd me
With that low, sweet voice of thine;
The days are gone for ever
When I thought to make thee mine!
Thou wouldst not thus so witchingly
Have smiled upon me now,
Couldst thou but know how beats my heart,
And throbs my burning brow.
I know thou hast forgiven me;
Yet painful 'tis to see
A tranquil smile upon thy cheek,
Where a warm blush used to be:
Why should thy hand so readily
Be proffer'd when I come?
I loved thy former welcoming—
Thou look'd'st it, and wert dumb.
We never to each other
Can be what we have been;
And I must hide my feelings'neath
False apathy's cold screen;
But with me ever lingers
A memory of the past,
And o'er my sad futurity
Its lengthening shade is cast.
Affections have been squandered,
Once hoarded all for thee;
And now I feel how priceless is
A true heart's constancy;
And oft, in silent bitterness,
I wander forth alone,
And ponder on the joyous hours
When I was thine alone.
Then do not mock me, dear one,
With friendship's icy forms;
And do not wear that tranquil smile,
Which gleams but never warms:
'Tis better ne'er to meet thee,
Than in remorse to dwell—
My own fate is before me,
A long, a last farewell!"

"I loved thee till I knew
That thou hadst loved before,
Then love to coldness grew,
And passion's reign was o'er;
What care I for the lip,
Ruby although it be,
If another once might sip
Those sweets now given to me?
What care I for the glance of soft affection full,
If for another once it beam'd as beautiful?
That ringlet of dark hair—
'Twas worth a miser's store;
It was a spell 'gainst care
That next my heart I wore;
But if another once
Could boast as fair a prize,
My ringlet I renounce,
'Tis worthless in my eyes:
I envy not the smiles in which a score may bask—
I value not the gift which all may have who ask.
A maiden heart give me,
That lock'd and sacred lay,
Though tried by many a key
That ne'er could find the way,
Till I, by gentler art,
Touch'd the long-hidden spring,
And found that maiden heart
In beauty glittering—
Amidst its herbage buried like a flower,
Or like a bird that sings deep in its leafy bower.

No more shall sigh of mine
Be heaved for what is past;
Take back that gift of thine,
It was the first—the last.
Thou mayst not love him now
So fondly as thou didst,
But shall a broken vow
Be prized because thou bidst—
Be welcomed as the love for which my soul doth long?
No, lady! love ne'er sprang out of deceit and wrong."

We quote one verse from a lively poem, "The Wind's in the West:" the image of the

ship seems to us one of great beauty, though the division of the lines is bad.

"The wind's in the west! and the blossoms are all
Silver and ruby on every tree;
The wind's in the west! and the white ship tall
Gleams like a palace upon the sea."

"The Scarf of Gold and Blue" and "Mary Queen of Scots" received our tribute of praise when they were published in the *Annals*; we therefore pass on to other favourites. "An evening Hour," "Sir William of Normandie," and a sonnet called a "Night of Stars and Poetry," deserve particular mention for talent. We believe Mr. Henry Glassford Bell is a young gentleman of much reputation on the other side of the Tweed; he has our cordial welcome on this, and our good wishes.

THE MARCHMONT PAPERS.

WE are tempted to another and a longer quotation from this important and interesting work, than any in our preceding review. It gives a curious picture of a closet interview between the king and a peer of the realm, on a very memorable crisis. It is Nov. 30, 1744-5.

"The Dukes of Queensberry, Montrose, and I, met at Lord Stair's, who proposed to tell the king, in our joint names, that we had made our proposal only for his service, and were ready to serve him in any shape he thought proper. The only objection made to this was, its being already done. I told them I would go in to the king this day. Then Lord Stair talked of the danger of our becoming a province to France. I went into the closet to the king after the ministers were gone out. I told him, I did not come to trouble him about a proposal wherein I had a share. He said: 'I liked it; but the difficulties it would have met with in the House of Commons, made it impracticable.' I said we were too happy to have his approbation; it was our duty to submit to what was thought for his service. Then I told him my share in it, and what I had done before. He said: 'You know what a distress it would have been, and what an effect abroad it would have had, had it been rejected in the House, or carried by a small number: you know how the last was carried, so many voting against it.' I told him, I did not mention it, but to shew that we were ready to serve him in any shape; that our wish would have been to have had him form the plan, and left us the honour of the execution only; that my family, he knew, had always been zealous friends to his cause; that I was the same, and ready to set my life and fortune at the same stake; that my brother had voted against the last regiments, but had no view in it of distressing his service, nor would have any such view at any time; that he was the only person with whom I had any influence or interest in the House of Commons; and that I could assure him, he would exert all his talents to serve his family; that it was in this view we had agreed that he should propose the act, making it treason to correspond with the Pretender's son, when it was neglected by others. I told him, that I desired to inform him of the state of Scotland; that all the south was zealous for him. He said they were all presbyterians, who had always been for his family; that Dumfries, Glasgow, and others, were good towns; but that he could not say so much for Edinburgh. I told him, he had even there at least four out of five. He said, there were a great many Jacobites there. I said, that in the south there were not a hundred papists; and that the people were zealous for him, and all those that had property. He said, he believed so, except Lord Kilmarnock. I said, he was a man of

desperate fortune, whose estate would go to his creditors, when his person was under forfeiture; that I had an estate in the country where he lived, and there was none of property there; and in another county, there was but one man of property, a Jacobite, against whom a warrant had been granted. He said: 'Mr. H.,' but that he had not been taken. I said, there was not a man of 'em could carry out a hundred men against him in the south. He said the southern parts liked the union, and found benefit by it. I said, his majesty knew that it had been made to bring the crown into his family. He said: 'Yes; but they had felt benefit by it too.' I said, no doubt they had; that I could assure his majesty, he had twenty thousand good men ready to arm for him in the south; and that all we desired, was to have him for our king. He said, he had ordered the duke (who was in very great spirits, and extremely pleased with the civilities he received in the country), as soon as this was decided, to detach a body of troops to Scotland, and that the Scots regiments were to recruit in the south of Scotland; but that I knew that London was the principal place. I said, his majesty was the best judge; that his people in Scotland desired no other; that I had lived in his foreign dominions, and therefore could assure him, that he had no where better subjects than in the south of Scotland; and who wished to see his interest superior, abroad and at home, and to see him respected on the continent as well as here; that they had nothing to do with the English factions. He said: 'You have factions amongst yourselves; there are the Highlands against the Lowlands, and others; but one must do the best one can.' I said, there were no factions against him: all we desired was, to have him cast an eye upon us, and to have access to him. He said, he had never refused any body. I said, I was far from meaning so, and that I had taken the liberty to trouble him, only to represent the state of Scotland to him. He said, he looked on the two countries as one united, and would equally regard them both; that Scotland had always been well affected; but, indeed, the last elections had not gone as he desired; but he hoped it would not be so more. I said, that the elections had never gone against him; that, indeed, if any subject would act without regard to his interest, and pretend to set himself up, it would create difficulties; but that all we desired to know was, his majesty's own opinion. He said, he never would let any subject set himself between him and his people. I said, that was all we desired; we wanted to behave like good subjects, and have none between him and us. He repeated, he had never refused any. I told him, I am sure I ought not to think so, since he had shewed but too much goodness in hearing me so long; that it was the first time I had ever had the honour to speak to him; and I desired he would be assured, that he had not a subject more affectionate to his cause than I was; that I wished the method proposed now, to arm in Scotland, might answer. He said: 'What would you have me do? they have offered it—they have offered it.' I said, I wished it success; but could have wished in this, and in ours, that his majesty, who understood these matters better than any in his council, had formed the plan. He said, the House of Commons would not consent, as I saw by the last. I said, I believed many voted then, because they thought he did not approve of it. He said, 'I did not approve of it at first: but these lords having shewed so much zeal, my ministers thought it was proper; and when I did ap-

prove of it, it should not have been obstructed.' He said, great zeal had been shewed every where; and when this was over, some scheme must be thought of to prevent it for the future. I said, the south of Scotland would be glad to concur in any his majesty judged himself to be proper. He said, his ministers would propose something to secure the south of Scotland for the future. I said, whatever service in that, or any thing else I could do for his family, I should always be ready to do. I begged leave to assure him, he should always find me a faithful subject; and if he ever did me the honour to speak to me again, he should always find me a man of truth. When the king mentioned the duke, he said he had some regiments together, with which he was sure he would give a good account of the rebels. I told the king, I hoped so, and did not doubt it; that they were a pack of robbers from the head of Argyleshire; that his majesty knew well enough from what country they came. He said, 'Yes;' they were the Camerons, the Stewarts of Appen, and the Athole men."

When disputes ran highest against Sir R. Walpole's ministry, Alexander Earl of Marchmont thus writes to the Earl of Stair (1739)—

"No doubt you have heard of Sir Robert Walpole's rudely disabliging the prince. When a deputation was appointed to compliment him, Sir Robert called across the house to Alderman Heathcote, who was one of those named to go, 'Take a bank bill of 20,000*l.* with you—he needs it—he will touch.' You may guess how this is taken; and I am told, he has called the prince one of the pretenders to the king's crown—one at Rome, the other at Norfolk House. What does not such a fellow deserve? What do you think of all this flagitious madness from one in his situation? The Duchess of Marlborough shewed me a drawing, which points out his deserved exit."

From the letters to Hugh Earl of Marchmont, who succeeded his father in 1740, "we shall make a few selections; and, for the sake of room, afford them no other introduction or comment than the names of their celebrated writers.

"I do not know now whose life or death to wish for; I know whose death I should have wished some years ago, to have prevented the mischiefs that are now remediless, and whose lives to have enjoyed better times; but in certain situations it is happier for honest men to die than live, and in some times fitter that knaves should govern, to stand charged with the infamy of them to posterity. God Almighty certainly knows what he does when he removes those from us whose lives we pray for, and leaves behind those scourges which a mercenary people deserve, though the partiality of a few virtuous or brave men (who happen to be born among them) would save them. We do not live, my lord, under the Jewish dispensation, nor are to imagine the most dirty, rascally race on earth are the favourite people of God. You know, when they were so, after they had provoked him enough, he punished them with an absolute king: he has done as much to all Europe of late days; and if Britain should be the only corner left still free, do you think it will not be more his goodness than our merit?"—*Pope*.

"Whether the Supreme Being governs the moral and physical worlds by general laws, as I find most reason to believe, for this is matter of opinion only—or by particular providences, resignation to his government is our duty most

* The allusions are to his death and that of Sir William Wyndham.

certainly; and wherever we are concerned as individuals—I mean wherever the accidents of life, or that of death, fall on us alone—I think we should practise, as far as the frailty of our nature permits, the lesson contained in the hymn of Cleanthes—we should follow cheerfully, what we must follow necessarily, the order and disposition of Providence; but in all cases we should follow it without murmuring; and this may be done by him who feels his loss, and who even indulges his grief the most."—*Bolingbroke*.

"The languor and dispiritedness that have made life burthensome to me all this winter, require a better climate, and more dissipation, than I can find here; and I think it is better conversing with the cheerful, natural born slaves of France, than with the sullen, venal, voluntary ones of England. * * * The curiosity of knowing what becomes of one's country and one's friends is natural—nay, the want of it would be blamable; but, beyond that, I protest, the melancholy prospect before us has sunk me into such an indifference as to public matters, that I should neither trouble my friends nor myself about them. I want those two great prevailing springs of action, avarice and ambition; and being convinced that, as the world goes, a man that will enjoy a quiet conscience must lead a quiet life, I most cheerfully embrace an honest, however contemptible, obscurity."—*Chesterfield*.

(1743) "I am lame—my wife has lost the use almost entirely of one hand. We are going to the pool of Bethesda; and we shall soon see whether the angel will descend and stir the water for us. I take my resolution of bearing the ills I cannot prevent or remedy, as well as another. But physical evils put philosophy to the hardest trial; and instead of crying out, like the stoic, 'Gout, do thy worst!' I will never confess that 'thy pain is an evil.' I confess that it is a great one, and that a rheumatism causes much perturbation of mind, as well severe bodily sensations."—*Bolingbroke*.

"The state of my health, like that of my fortune, is not abundant, but sufficient, because I spend little, and shall want neither of them long."—*Id.*

"I agree with your lordship, that it is better to be clapped on the stage than hissed; and I approve the desire of applause, because I apprehend that the maxim *contemptus fama certamen virtutes* was drawn by Tacitus from a just observation of human frailty. But the applause of the world is a very uncertain tenure; and a wise and a good man will secure to himself another—that inward, conscious applause, which will never fail him when he has deserved it."—*Id.*

The following, entire, are of much literary interest.

Mr. Pope to Hugh Earl of Marchmont.

"Easter Monday."

"My dear Lords,—When I see a finer day, or feel a livelier hour, I find my thoughts carried to you, with whom, and for whom, chiefly I desire to live. I am a little revived to-day, and hope to be more so by the end of the week, since I think that was the time you gave me hopes you would pass a day or two here. Mr. Murray, by that time, or sooner if he can, will meet you. I hope Lord Bolingbroke has settled that with him in town. Mr. Warburton is very desirous to wait on you both; if he

* "This letter, without date or signature, is directed to the Earl of Marchmont, Bathurst; but is evidently addressed both to him and to Lord Bolingbroke. It is probable that it was written in 1744. He died on the 30d May of that year."

comes to Battersea in a morning, pray furnish him with my chaise to come on hither, and let the chaise be left here, of whose earthly part I shall make use in my garden, though not of its aquatic. My faithful services wait on Lady Marchmont."

Viscount Bolingbroke to Hugh Earl of Marchmont.

"Battersea, Monday.

"My dear Lord,—The arrival of your servant with the message from Lord Stair gives me an opportunity of telling you, that I continue in the resolution I mentioned to you last night, upon what you said to me from the Duchess of Marlborough. It* would be a breach of that trust and confidence which Pope reposed in me, to give any one such of his papers as I think that no one should see. If there are any that may be injurious to the late duke or to her grace, even indirectly and covertly, as I hope there are not, they shall be destroyed; and you shall be a witness of their destruction. Copies of any such, I hope and believe, there are none abroad; and I hope the duchess will believe I scorn to keep copies when I destroy originals. I was willing you should have these assurances under the hand of, my dear lord, your faithful and devoted humble servant,

BOLINGBROKE.†

Viscount Bolingbroke to Hugh Earl of Marchmont.

"Monday Morning.

"Our friend Pope, it seems, corrected and prepared for the press, just before his death, an edition of the four Epistles that follow the Essay on Man. They were then printed off, and are now ready for publication. I am sorry for it, because, if he could be excused for writing the character of Atossa formerly, there is no excuse for his design of publishing it, after

* "The following passage occurs in Johnson's Life of Pope:—'He (Pope) left the care of his papers to his executors, the Earl of Marchmont and Lord Bolingbroke, whom undoubtedly he expected to be proud of the trust, and eager to extend his fame. But let no one ever dream of influence beyond his life. After a decent time, Dodsley the bookseller attended one of them, to solicit preference as a publisher, and was told, the parcel was not yet inspected; and, whatever was the reason, the world has been disappointed of what was reserved for the next age.' This letter alone would shew that this imputation, as affecting Lord Marchmont, is wholly groundless. It is to Lord Marchmont that Lord Bolingbroke states a certain line of conduct which he is ready to hold, and what line of conduct is forbidden him, under the exclusive power and control over his papers committed to him by Pope. All that Lord Marchmont feels himself authorised to do with regard to certain papers of his supposed to exist, is to convey to Lord Bolingbroke a message respecting them; and when Lord Bolingbroke declares that he will destroy them, if ascertained to exist, the only part allotted to Lord Marchmont in the transaction is that of a witness of their destruction. But it appears, that in the third edition of his Lives of the Poets, Johnson substituted for the first sentence of the passage cited, the following:—'Pope left the care of his papers to his executors; first, to Lord Bolingbroke, and, if he should not be believing, to the Earl of Marchmont—undoubtedly expecting them to be proud of the trust.' It is quite clear, not only that Johnson had not read Pope's will when he wrote his life, but not even when he had to qualify an assertion on a matter connected with that will in the third edition of it. From the last quoted statement of his it would be supposed that Lord Marchmont and Lord Bolingbroke were the sole executors; but there were four executors—Lord Marchmont, Lord Bathurst, the Hon. William Murray, and George Arbuthnot; and Lord Bolingbroke was not of their number. Pope, however, left all his manuscript and unprinted papers to Lord Bolingbroke, 'committing them to his sole care and judgment, to preserve or destroy them; or, in case he should not survive him, to the above said Earl of Marchmont.' As Lord Bolingbroke survived Pope, he had these papers, which never came into Lord Marchmont's possession. Lord Marchmont complained of inaccurate statements made by Johnson in his Life of Pope, in despite of the information which he had afforded him, and which, he apprehended, would be laid to his charge, as it was known that he had been in communication with that author respecting it."

† "As Pope died on the 30th of May, 1744, this letter must have been written between that day and Lord Bolingbroke's departure for France."

he had received the favour* you and I know; and the character of Atossa is inserted—I have a copy of the book. Warburton has the propriety of it, as you know. Alter it he cannot, by the terms of the will. Is it worth while to suppress the edition? or should her grace's friends say, as they may, from several strokes in it, that it was not intended to be her character? and should she despise it? If you come over hither, we may talk better than write on the subject. Adieu, my dear Lord."†

We have nothing to add in the way of praise: such a publication speaks best for itself.

Thoughts on Man, his Nature, Productions, and Discoveries. Interspersed with some Particulars respecting the Author. By William Godwin. 8vo. pp. 471. London, 1831. Effingham Wilson.

THE result of thirty years' meditations of the author of the "Inquiry into Political Justice" are well entitled to consideration. Sound reason and humane principles form the essence of this truly excellent volume; which, being the production of a thinking man, will be a fountain for thoughts in all his readers. To analyse it will require much attention; and for the present announcement of it we shall aid our good opinion with but two passages. In the first we detect the fruitful cause of much of that spirit which now distracts our country; and we see, if the schoolmaster is abroad, that he has not been abroad widely or long enough.

"It is principally while knowledge and information are new, that they are likely to in-

* "At the bottom of the original letter is written, in Mr. Rose's handwriting, in pencil, '10000.'; and this sum Lord Marchmont stated to be the favour received by Pope from the hands of the Duchess of Marlborough. Pope expresses himself as follows, respecting the Duchess of Marlborough, in a letter to Swift of the 17th May, 1739—'The Duchess of Marlborough makes great court to me; but I am too old for her, mind and body;' thus closing this intelligence by an insinuation which is as coarse as it is groundless, and, from obvious circumstances, absurd. But in a later day, his feelings towards her shew themselves plainly, in a letter she printed in this collection, which must have been written about July 1742. The veneration which Pope there professes for her grace is a demonstration made solely to give more point and effect to the expression of derision, and even aversion, which its last words distinctly breathe. Her grace's letter to Lord Marchmont, of the 3d March, 1742, shews how much she was afraid of Pope. She is alarmed lest her religious belief, if such it is to be called, should not be quite religious enough for him; and she begs his lordship to 'endeavour to keep him her friend.' She was then well aware that his friendship was held under a slippery tenure; and it seems probable that her effort to secure it had been already made. After the evidence we have how generous and munificent her friendship could be, as is evinced by her conduct to Lord Marchmont on his father's death, of which the proof is in her letter to him on that occasion, and by her legacies to Mr. Pitt and to Lord Chesterfield, it would be very unjust to assume that her gift to Pope was under intimidation only. But, Pope, crooked-minded, and impressed as he was towards her, was little likely to give her credit for disinterested blindness—he was too clear-sighted not to have discovered her apprehensions of him; and, fond of contriving and managing as he was, it would have been painful and humiliating to him to have been, in his own view of the matter, outwitted, outmanœuvred, and compelled to consent to have an object carried against him in despite of himself, and to forego a magnificent subject of satire, of which he had made himself thoroughly master, even under her own roof. He was sure that in the caricature he had not mislaid the likeness, for he was in correspondence with her, and he frequented her house on a footing of much familiarity—facts which appear in her letter of the 15th March, 1742; so that he added an act of remarkable perfidy to the ingratitude he was guilty of towards his benefactress. He had made a splendid dissection of a rare and peculiar specimen, with all the avidity of professional eagerness, and could not endure to be balked of the display of his exquisite anatomical skill. It may well have been, and one must hope it was so, that, carried away by the strength of these impulses of his mind, he committed this act of singular baseness and malignity, without allowing himself to recognise the deformity of the features which it presents to the eye of the bystander."

† "This letter must have been written after the preceding letter, but before Lord Bolingbroke left England. He wrote from Calais on the 18th June."

toxicate the brain of those to whose share they have fallen; and, when they are made a common stock upon which all men may draw, sound thinking and sobriety may be expected to be the general result."

Mr. Godwin is decidedly inimical to the system of ballot, and his objections are as plain and as obvious as they are profound and philosophical.

"The very essence of this scheme is silence. And this silence is not merely like that which is prompted by a diffident temper, which by fits is practised by the modest and irresolute man, and by fits disappears before the sun of truth and through the energies of a temporary fortitude. It is uniform. It is not brought into act only, when the individual unhappily does not find in himself the firmness to play the adventurer. It becomes matter of system, and is felt as being recommended to us for a duty. Nor does the evil stop there. In the course of my ordinary communications with my fellow-men, I speak when I please, and I am silent when I please, and there is nothing specially to be remarked either way. If I speak, I am perhaps listened to; and if I am silent, it is likely enough concluded that it is because I have nothing of importance to say. But in the question of ballot the case is far otherwise. There it is known that the voter has his secret. When I am silent upon a matter occurring in the usual intercourses of life, where I might speak, nay, where we will suppose I ought to speak, I am at least guilty of dissimulation only. But the voter by ballot is strongly impelled to the practice of the more enormous sin of simulation. It is known, as I have said, that he has his secret. And he will often be driven to have recourse to various stratagems, that he may elude the inquirer, or that he may set at fault the sagacity of the silent observer. He has something that he might tell if he would, and he distorts himself in a thousand ways, that he may not betray the hoard which he is known to have in his custody. The institution of ballot is the fruitful parent of ambiguities, equivocations, and lies without number."

Narrative of a Voyage to the Pacific and Beering's Straits, to co-operate with the Polar Expeditions; performed in H. M. S. Blossom, under the command of Capt. W. F. Beechey, R.N., in the Years 1825, 26, 27, 28. Published by authority of the Lords Commissioners of the Admiralty. 4to. pp. 742. London, 1831. Colburn and Bentley.

THIS splendid volume has at length reached us; and we have had an opportunity of perusing in full many of those interesting statements, slight sketches and hints of which we had the pleasure to receive during the progress of the voyage, wherewith to enrich several Numbers of the *Literary Gazette*. And though we do not this week go into extracts, partly on account of the difficulty of selecting passages brief enough for our pages, and partly on account of the late hour at which we received the volume, when our columns were previously arranged—we cannot allow a Saturday to pass without bearing testimony to the superior merits of this sterling production. The narrative is replete with every thing that can attract British feeling: the description of hitherto unknown lands, the perils of four years' travel, the near approach to the consummation of the great object contemplated, accounts of extraordinary customs among uncivilised tribes—in short, all that can delight the reader, are given by Captain Beechey in a manner infinitely to

enhance that delight. Not to speak of his memorable doings in Beering's Straits, his touch at Loo Choo is in itself an episode which would float a quarto volume upon the tide of popularity. The maps, too, and the multitude of admirable engravings from the burins of the Findens, deserve the highest encomiums;—but we must finish with only one—Beechey's Voyage to the Pacific is full of valuable information, told in the most agreeable manner.

Fuseli's Life and Lectures. 3 vols. 8vo. Colburn and Bentley.

THIS large publication has also reached us, but merely in time for a paragraph. The Life occupies 418 pages of Vol. I.; twelve Lectures occupy Vol. II. and 60 pages of Vol. III.; aphorisms, chiefly relative to the fine arts, take 100 pages more; and the work finishes with views of the various great schools—the Tuscan, Florentine, Roman, Mantuan, Neapolitan, Siennese, Venetian, and Bolognese. Some of the aphorisms are very striking; and we shall take an opportunity of winnowing them. To-day we only quote one anecdote from the memoir. Fuseli was educated for the church, at Zurich.

“As his reputation stood high at college, and as his society was coveted for the power which he displayed in conversation, and for his deep knowledge in the classics and in sacred and profane history; so, a great degree of curiosity was excited among his friends as to the success of his probationary sermon, which he knowing, with characteristic humour, took his text from the 17th chapter of the Acts of the Apostles, 18th verse—‘What will this babblers say?’ and preached against the passion of curiosity.”

Buffon's Natural History of the Globe, and of Man, Beasts, Birds, Fishes, Reptiles, and Insects. Corrected and enlarged by John Wright, M.Z.S. 4 vols. 18mo. London, 1831. Tegg.

WE have here an extremely neat and compact edition of Buffon's celebrated work, illustrated with abundance of well-executed wood-cuts, printed in a good clear type, and sold at an extremely moderate price. The editor has also consulted Cuvier, Lacépède, and other eminent naturalists, to improve the text, and give the latest information; so that, altogether, we are bound to mention this publication as a valuable accession to the cheap and pleasing intelligence now so generally diffused. Both young and old will read it with instruction and delight.

A Manual of Analytical Chemistry. By Henry Rose. From the German by J. Griffin. 8vo. pp. 454. London, 1831. Tegg.

THE practical chemist is as much indebted to Mr. Griffin as the student, for his translation of this admirable work. The name of Rose is well known to the scientific world; and of the two chemists of that name who are ornaments to the Prussian capital, Mr. Henry Rose is particularly distinguished by the philosophy of his researches and the accuracy of his experiments. It would be mere supererogation, then, on our part, to say any thing of the volume before us: its arrangement is somewhat novel, but its details embrace an immense number of facts, many of which possess the greatest interest. Works on analytical chemistry are exceedingly rare in this country; indeed, we had none of importance until the translation of Klaproth made its appearance; and Dr. Reid, of Edinburgh, has lately published a useful work of the same character. These, however, have made

Mr. Rose's Manual only more acceptable; and we have merely to regret that it was not placed in the hands of a more correct translator. “There be (says Mr. Griffin) translations in which the text hides its diminished head under the accumulated illustrations of the translator;” and there are, we may add, translations which profess to come from the pen of scientific men, and which would disgrace the grammatical accuracy of a preparatory school. The rejection of the nomenclature of Berzelius, used in the original, as, to us, an unpardonable fault.

ARTS AND SCIENCES.

ROYAL INSTITUTION.

THE subject announced was, on the reproductive powers and history of the Planarie, by Dr. J. R. Johnson, a gentleman who has paid very great and close attention to these little animals, but who, in consequence of sudden and severe indisposition, was unable to appear behind the lecture-table. Mr. Faraday, therefore, came forward, at a very short notice, to supply the vacancy.

Mr. Faraday's subject was *oxalamidi*—a substance recently found by M. Dumas, and which possesses some curious relations to organic and inimitable matter. It is obtained by distilling the salt called oxalate of ammonia, and is a white, neutral, insipid substance, almost insoluble in water, containing neither oxalic acid nor ammonia, but able to yield both by treatment with potash and water, and in such quantities as to surpass in weight the oxalamidi used. Mr. Faraday first spoke of the chemical history of oxalic acid and ammonia, stating and illustrating, as he went along, in what manner M. Gay Lussac succeeded in producing the former from a great variety of organic matters, by the action of potassa; and also pointing out, that the latter is almost always the result of the decomposition of organic matter: oxalate of ammonia was then found, and from it the oxalamidi by distillation. Finally, Mr. Faraday dwelt, with his accustomed perspicuity, upon the views entertained by M. Dumas and others, and referred to the general paucity of means possessed by man to imitate organic bodies—the influence of these means, both in theory and practice, and the extension of that portion of knowledge which relates to both organic and inorganic matter by the discovery of oxalamidi.

In the library there was a beautiful apparatus, by Mr. Harris of Plymouth, for determining the laws of the development of voltaic power, by the heat evolved in a wire through which the current is passing. There was also a very beautiful quadrant, in which the effect of parallax was removed, and by which an angle of 170° could be taken. Some very fine engravings were also exhibited; amongst them an unfinished proof, by Mr. Landseer, of the Dogs of the Pass of St. Bernard. There were likewise some curious metallic productions, from Mr. Johnson of Hatton Garden, embracing a finely worked paladium chain for the Emperor Nicholas—Russian platina coinage—and native platina from Russia.

GEOLOGICAL SOCIETY:—ANNIVERSARY MEETING.

THE Rev. Adam Sedgwick, F.R.S. president, in the chair. The president informed the Society, that the medal on the foundation of the late Dr. Wollaston had been awarded by the council to Mr. William Smith, for the eminent services rendered by that gentleman to geology, and especially for his having been the

first successfully to point out to geologists the importance of fossil remains in the study of the science. Professor Sedgwick in the evening, on quitting the chair as president, at the termination of the triennial period prescribed by the regulations of the Society, took his leave of the members in a splendid and elaborate discourse,—in which he reviewed the present state of geology, its prospects, and the rules of reasoning to be adhered to in studying its phenomena; entering into a detailed analysis of the labours of the Society, as well as of those of the most distinguished geologists on the continent during the preceding year. Roderick Impey Murchison, Esq. F.R.S. was elected president, and Dr. Turner and H. T. De la Beche, Esq. secretaries.

CELESTIAL PHENOMENA FOR MARCH.

20^d 20^h 21^m—the Sun enters Aries, the vernal equinox.

J. T. B.

NEW PROCESS OF DISTILLATION.

WE have occasion to call the attention of our
readers to what will probably be deemed one of
the most curious discoveries that has been

effected in the useful arts during the present century,—that of procuring alcohol, or ardent spirit, from fermented paste, such as is commonly used for making baker's bread; in lieu of making an extract of malt or corn, for the especial purpose of raising a vinous fermentation, as now practised by the corn distillers. This important discovery has been made by Mr. Robert Hicks, a gentleman in the medical profession, who, we understand, has just taken out a patent for the invention.

As nearly all vegetable substances capable of undergoing the vinous fermentation are known to give out a certain portion of aroma, in conjunction with the carbonic acid gas evolved by the process, it might have been inferred, *a priori*, that at least a portion of such vapour contained gaseous alcohol. But the discovery of this fact, obvious as it may appear when once announced, has hitherto been overlooked, notwithstanding the profound discoveries which have been made in almost every department of chemical science during the last thirty years. The only doubt we entertained on the question, on hearing of this discovery, was, as to the practicability of obtaining spirit in any quantity worthy of notice, from the vapour of fermented paste, and sufficiently pure for the purposes of the rectifier. Previous to offering any notice of this important invention, therefore, we took the trouble of investigating its nature, and of tasting a sample of the spirit which had been produced from the condensed vapour given off during the process of baking. The specimen we tasted served at once to satisfy us of the perfect practicability of the process on a large scale. The sample (which appeared to be nearly the strength of proof spirit) was certainly destitute both of that empyreumatic flavour, which might have been in some measure expected from a species of *dry* distillation, like that of the baking process; while it was equally free from any fetid or unpleasant odour, such as would be supposed to result from imperfect fermentation. We should say that the spirit we tasted had a slight acidulous or ether-like quality, by no means unpleasant to the palate, but which may probably be quite got rid of by subsequent rectification. It is needless to state that it was also perfectly free from colouring matter, and apparently applicable to the most delicate purposes of the rectifiers and compounders of British spirits.

In the absence of any drawing or plate to illustrate the invention of Mr. Hicks, we shall endeavour to give such a description of the new baker's oven and distilling apparatus, as may perhaps render the invention intelligible to the majority of our readers.

The body of the oven, instead of being constructed of brick-work, is formed of iron plate, and made of a circular figure, having a coating of brick or tile for receiving the loaves, when prepared of the usual sponge or dough. This oven is supported upon hollow brick-work beneath, with a space round the sides and top, sufficient to allow the play of the flame or heated air from the fire below. About a foot beneath the bottom of the oven is a circular iron plate, of the same diameter with itself, on which rests the grate or fire-chamber, with openings for the ashes to fall through into the ash-pit beneath. This circular platform is affixed to, and made to revolve on, a vertical axis, furnished with a bevil wheel, which communicates with another bevil wheel fixed on the end of a horizontal shaft; the exterior end of which shaft is provided with a winch, to enable the platform to be kept in motion by the hand, or any other moving power that may be judged neces-

sary. The object of applying this machinery is to keep the action of the fire uniformly distributed beneath the bottom and round the sides of the oven. But in addition to this desirable point, we are informed that a very great saving of fuel is effected, as compared with the quantity required to heat an oven of the same capacity by the common brick flues. Indeed, when we take in view the rapid conducting power of metal compared with brick-work, nearly the whole effect of the fuel must be rendered available for the double process of baking and distillation. In order to prevent any escape of the heated air or flame, the edges of the circular platform are bent downwards, and made to work in a narrow trough of water, forming what may be called a water-joint.

From the upper portion of the oven, a large chamber or pipe receives the vapour evolved from the baking process, and carries it onwards through a pipe and worm-tub, or refrigerator, as in the usual process of distillation. This vapour from the bread contains a quantity of carbonic acid gas, combined with the alcohol vapour; but the latter becomes condensed into the liquid form; while the former flies off in the gaseous state, from the recipient containing the spirit.

The upper portion of the oven also contains a most ingenious contrivance for regulating the temperature of the whole process with the utmost precision. An iron tube, containing a quantity of oil, with a thermometer immersed in it, contrived so as to lower down into the body of the oven, and to be withdrawn at pleasure; thus preventing the possibility of the oven being overheated sufficiently to scorch the bread, or impart a disagreeable flavour to the spirit. The operative portion of this compound process seems to us to be provided for in a manner so as to leave little, if any thing, to be desired.

The practical application of this important discovery may lead to results which cannot at present be anticipated. Without offering any opinion as to the benefit to the community of the extensive consumption of ardent spirit, there can be no manner of doubt that, if it be a benefit, the more cheaply it can be procured, the greater will be the advantage in an economical point of view. If that which has hitherto been deemed a worthless vapour can be now converted into a valuable product, as an article of almost universal consumption, the discovery must, at all events, be deemed one of great importance in civil economy, and calculated to enhance, in a very eminent degree, our national reputation for improvements in the several departments of the useful arts. How far the discovery of Mr. Hicks may be found to militate against the interests of persons at present connected with distillation from corn, it is not our business to inquire. Neither is it necessary to investigate the position in which the patentee may stand with regard to the present excise regulations relative to the distillation from grain. But the merits of the discovery can be in no wise prejudged, as a scientific process, by the influence it may exercise on any question of manufacturing speculation.

With regard to the influence it may have indirectly upon the agricultural interests of the country, from a considerable diminution of the consumption of grain, we are not enabled at present to form any estimate. It will assuredly tend to diminish the enormous consumption of barley at present required for the use of the corn distillers; but when it is considered that the growth of barley in this country is not ade-

quate to such consumption, and that a considerable sum in specie is annually paid to the foreign agriculturist for the importation of grain, without the smallest return being made as a compensation to our manufacturing interests; it is doubtful whether the English agriculturist would eventually suffer by the general introduction of this invention for saving the consumption of grain in the process of distilling. Another important saving will be effected in the consumption of fuel at present used for distillation, which forms so large a portion of the outlay required in this extensive branch of manufacture. We have heard it stated (but almost deem it incredible) that the sponge necessary to form the peck loaf is capable of yielding three ounces, imperial measure, of proof spirit during the operation of baking, and without prolonging the process beyond the ordinary time for baking the quarter loaf. It is also stated, that the bread baked by this new oven is superior in quality, and more porous in texture than that baked in the usual way, from the vapours being carried off as fast as they are generated by the new patent oven, while a great portion may be presumed to be again condensed and incorporated with the bread by the old process. The invention, in a variety of respects, will be likely to excite no ordinary attention in the public mind, the moment it is reduced to practice.

LITERARY AND LEARNED.

ROYAL SOCIETY.

DAVIES GILBERT, Esq. V. P. in the chair. Two papers were read; the first by Mr. Barry, on the chemical action of atmospheric electricity; and the second by Mr. Lloyd, on the operations carried on by him in ascertaining the difference of level between the river Thames at London Bridge and the sea; and also for determining the height, above the level of the sea, of intermediate points passed over between Sheerness and London Bridge. In the library were exhibited the beautiful instruments employed by Mr. Lloyd. The Bishop of Chichester, Dr. John Lee, and Dr. Isaac Wilson, were elected fellows.

SOCIETY OF ANTIQUARIES.

HUDSON GURNEY, Esq., Vice President, in the chair. Among other presents to the Society, Miss Waddilove, daughter of the Dean of Ripon, at the instance of W. Bray, Esq., the venerable and respected late treasurer of the Society, presented a collection of extremely beautiful and interesting Spanish drawings and prints of the Alhambra Palace. Mr. J. Gough Nichols, by permission of Mr. Mackey, exhibited an ancient brass plate, found at Tours in France, commemorating the dedication of the Chapel of St. Eloy, by the Archbishop of Tours, in 1446. The ground of the plate had been cut out, leaving the inscription in relief; and the letters were rather tastefully ornamented, each line being varied. A communication was read from Mr. Smirke, in answer to Mr. Gage's remarks on the proposal to remove the organ screen at York, accompanied by some very pretty views of the screen in its present position, and as it is presumed it would appear after the alteration; but the correctness of which views, both as to situation and light, was very strongly attacked at the last meeting of the subscribers. Mr. Smirke observed, that although the Dean of York had yielded to the wishes of a large body who were opposed to the removal of the screen, he considered it necessary to make some reply to the remarks of the

director of the Society of Antiquaries. He asserted that the screen would not be deprived of light by its removal, as had been stated by Mr. Gage, but that the light thrown upon it would be increased; that with regard to the alterations at Ely, where the screen was removed to the second pillar of the choir arches (and in York Cathedral it had been proposed to remove it only to the first pillar in the choir), Mr. Gough had stated that the alteration at Ely was a restoration. Another point in Mr. Gage's remarks, was the mutilation of the screen, by reducing it to occupy the proposed new situation; and Mr. Smirke observed, that it had not been any part of his proposal to reduce the height of the screen, although he contended that it might have been done without injuring its beauty or proportions; he felt a just dread of mutilating a specimen of ancient art; but he observed, that much of the present screen was but modern plaster; and that the screen was formed of seven niches on one side of the entrance to the choir, and eight on the other; and consequently the entrance was not in the centre, and therefore he presumed the eighth niche was a modern addition, and had proposed to remove it. Mr. Gage had also said, that the removal would be against the rubric of the Church of England, which directed that the chancels should remain as they had done in times past; but Mr. Smirke observed, that some of the early reformers had been very strenuous in their endeavours to destroy the separations of the chancels from the naves of churches, because the laity were not admitted there, and they alleged that the people did not properly hear the service; but that the rubric referred to, which settled the dispute, merely decided that the chancel or choir should remain separated from the nave. Mr. Smirke stated, that now that the question of removal was settled, he did not wish to revive the discussion of it; but he considered it due to himself, and those who had agreed in opinion with him, to make some observations in justification of his opinions and conduct. We congratulate the lovers of architectural antiquities, that the attempt (worthy of a country churchwarden,) to mutilate and disfigure our northern masterpiece of ancient art, has been for the present abandoned,—we say for the present, as it appears from the dean's letter, published in the *Yorkshire Gazette* of the 19th inst., that he intends, at some future time, and at the expense of the dean and chapter, to partially remove the screen, though not so far as had been proposed. We sincerely hope that time will never arrive, and that our antiquarian friends will keep a vigilant eye to the subject.

ROYAL ASIATIC SOCIETY.

COLONEL BAILLIE, M.P. in the chair. A paper on the white elephant, by Captain Low, was read. It appears that there are several of these animals in the stables of the King of Siam, where great reverence is paid to them. When one is newly caught, he is attended by an escort, and the governors of towns meet him on the road, with every mark of respect. From a verse in Siamese, we learn that the white elephant ranks above the king! In the same communication Captain Low alludes to the *Albinos*, or White Indians; a drawing of one of whom accompanied the paper. The original was about forty years of age, fair as a European, white hair, and bluish eyes; very weak. He was married; his children were of the Malay complexion; and he had two sisters, who were likewise albinos. This person was

by profession a schoolmaster. Another short paper was read; it was on the popular Hindu belief of the creation, and an account of the incarnations of Vishnu. Colonel Broughton is the author. There were presented to the Society several valuable oriental literary works, by the Chevaliers De Hammer, D'Hemso, and other individuals. Two members were elected.

ROYAL SOCIETY OF LITERATURE.

FEB. 16. Colonel Leake in the chair. The Secretary read the first part of a paper, by Mr. Prince Hoare, on two connected subjects,—“The moral fame of authors,” and “The moral character of Shakspeare's dramas.” The object of the writer is to prove the inseparable connexion between the durability of the reputation of authors and the soundness of their moral principles and depth of their religious sentiments. In support of this opinion, he adduces Homer, Pindar, Sophocles, Horace, &c., among the ancients; and Dante, Tasso, Camoens, Fenelon, Goldsmith, Johnson, &c., in modern times, as instances of the superior advantages of moral writers over those of a different description. With regard to Virgil, he thinks that the great prize which that poet proposed to himself in the rivalry of Homer, was lost by omitting to follow the first of epic poets in the grand path to fame, indicated in that reverence for the supreme powers that preside over human actions, which distinguishes the *Iliad*. How far the surpassing eminence of our great dramatic bard is to be ascribed to the same principle, is the subject discussed in the second part of the memoir, the reading of which is reserved for another meeting. The portion read was remarkable for that amenity and intelligence of mind and manner which were the peculiar characteristics of the amiable author when in the full enjoyment of the health and spirits, the loss of which his friends and society have to lament.

Among the presents of books announced was the Corpus Inscriptionum Græcarum of Boeckius, the valuable donation of the Bishop of Salisbury, president of the Society.

[Fifth Notice.]

SOUTH ROOM.

No. 394. *Cutting an Old Acquaintance*. C. Hancock.—A fair hit at the way of the world; but we much doubt if brutes degrade themselves by imitating the men of it. The contrast between the two dogs is very happy.

No. 414. *View of the Ruins of the Castle of Bredersode in Holland*. A. Brondgeest.—It would have been difficult to make more of old walls.

No. 437. *The Fox detected*. T. Clater.—As in Mr. Mulready's “Wolf and Lamb,” the character and disposition of the animal are here exhibited in human shape. The future career of these young marauders may be easily foreseen: from plundering a henroost, to robbing the mail: from the treadmill to the gallows. In character, expression, and colouring, this is one of Mr. Clater's best pictures: the story is well told, and the effect is clear, brilliant, and powerful.

No. 440. *Descending to an Eagle's Nest, Morning: Dinner-ory, Noon*. “Cromaboo-a:” *False Lights on a Leeshore, Night*. W. Willes.—There is much originality of conception in the treatment of these subjects, and good character and effect; especially in “Night.”

No. 443. *Roderick Random and Miss Sparkle*.

W. Drummond.—We cannot compliment the artist on his choice of a subject: it is an offensive view of human nature. In the colouring and execution there is much to commend.

No. 447. *Mount St. Michael*. C. Stanfield.—We poured out our admiration of this noble work in our notice of the last exhibition at Somerset-House; and we mention it now, only for the purpose of expressing our astonishment and shame at its remaining without a purchaser.

No. 462. *The Interior of Mr. Pinney's Gallery, Pall-Mall*. W. Novice.—As far as the situation of the picture will enable us to judge, Mr. Novice has given more interest to this subject than it would appear to promise.

No. 475. *A Land Storm*. S. W. Reynolds.—We never remember to have seen a picture from the pencil of Mr. Reynolds, that did not excite our attention by its fine abstract qualities. His choice of scene, like that of Rembrandt, is simple in form, but attractive and characteristic in effect. We consider this to be one of the most powerful and striking productions in the gallery.

No. 476. *The Spae Wife*. T. Warrington.—However repulsive such a picture of age and infirmity, the artist has very ably personified a being, invested by northern superstition with supernatural powers; the object at once of terror and of persecution.

No. 489. *The Casket*. G. Lance.—A variety, in Mr. Lance's best style of jewellery.

No. 500. *Macbeth, Act IV. Scene 1*. T. H. Nixon.—A print from this highly imaginative performance was noticed in our 733d Number. The original amply justifies our encomiums on the artist's talents.

No. 502. *The Return from the Chase*. J. Nash.—A little crude in the colouring; but designed with great taste, and executed with much spirit.

No. 504. *Chelsea Reach*. J. Wilson.—A perfect gem in the class of art to which it belongs; with the most clear and sparkling effect.

No. 509. *Ruins; Moonlight*. W. Delmar.—As a composition this little picture is admirable; nor is it less so for its truth.

No. 554. *The Chase*. C. Hancock.—The perils of the chase, and one of its occasional catastrophes, fatal at once to the pursued and the pursuer, are here very ably and spiritedly depicted.

No. 548. *Isaac and Rebecca*. Vide *Ivanhoe*. K. P. Parker.—To the two characters thus introduced from Sir Walter's admirable novel, Mr. Parker has imparted a colouring and an effect which would not have discredited a Rembrandt.

No. 546. *The Forecastle of a Berwick Smack*. T. S. Good.—Nature, and nothing but nature. Here is no exaggerated opposition of dark to light, no catching gleam, proceeding no one knows whence, to attract attention. The figures seem to awake our recollections; and their weather-beaten features are pencilled with singular firmness and truth.

(To be continued.)

NEW PUBLICATIONS.

Fraser's Panoramic Plan of London. Dedicated to the Queen. Engraved on steel by Josiah Neale. London, J. Fraser.

A COMPLETE *bijou* of a map, and not less useful than elegant. The plan is laid down on the space of only about twenty-two inches in length, and a foot in breadth; but it is so clearly and accurately engraved, as to be adequate for all needful reference. Tints of colour

assist the eye, and almost render the sheet a picture. Round the borders are engravings of remarkable objects in and about the metropolis, such as theatres, bridges, the Bank, London University, New Post-office, and other public buildings. Altogether, we may fairly say, that for neatness, convenience, and general merit, we have nowhere seen a plan of our immense capital so worthy of public favour as this.

Of Man, Six Monograms. By David Scott, S.A. Edinburgh, Constable; London, Moon, Boys, and Graves; Hamburg, Peithis and Besser; Leipzig, Ernest Fleisher.

THIS is a very striking and extraordinary production, consisting of six designs, of singular wildness and power. They seem to be metaphysical imaginings, expressed with an energy of art which leaves us at a loss whether to wonder most at the daring hand of the artist or the exalted mind of the inventor. Life, relation, knowledge, intellect, power, and death, are the subjects; and they are all treated with much originality and grandeur of conception, as well as skill and boldness of execution. Who Mr. David Scott is, we know not; but if we trace his ideas to the mystical fount of German philosophy, his expression of them in these outlines forces upon us a comparison not to his disadvantage with the best things of Blake, Fuseli, Flaxman, and even Michael Angelo. We warmly recommend them to the notice of the lovers of art, and especially of what is remarkable.

Thomas Telford, Esq., F.R.S. L. and E. Painted by S. Lane; engraved by W. Raddon. London, E. Turrell, W. Raddon.

A more manly and masterly portrait cannot be produced. Our able engineer is represented in a natural attitude; and on the left is a distant view of one of his most celebrated works. The engraving is quite worthy of the highest name in this branch of art; and though we are not familiar with that of Mr. Raddon, we hail his accession to the band of which England has so much reason to be proud.

M. de Talleyrand. By F. Gerard; engraved by E. Finden. J. Murray; H. Leggett and Co.

We congratulate the admirers of little exquisite pieces of art, on the separate publication of this portrait. It is a beautiful curiosity.

Couture de Haut Ton, No. I.—Fancy Ball Dress, Ragusa, No. 1. London, W. Spooner.

THE French lady is a little dumpy, with all her prettiness; but the fair Ragusan is quite a creature to fall in love with. Both are likely to attract the patronage of the sex for whose tastes they are intended; for the dresses are unexceptionable. The execution is very pleasing; and the colouring of the lithographed plates far more carefully and neatly finished than is usual with performances of the class. We perceive this is to be a periodical; so that our fair ladies may have a continual reference to what is most new and most becoming, and consequently what is most interesting!!

CONVERSAZIONE TO PROMOTE THE FINE ARTS.—We hear of the formation of a Conversation on a more extensive scale than any hitherto established, for the promotion of the Fine Arts. Lord Wharnduff is said to be the originator of this design, with the concurrence of Lord Farnborough and other distinguished patrons of our native school. The members are proposed to consist of 120 of our principal

artists, and 80 amateurs; each member to pay an annual subscription, and meetings at stated periods to be held.

DIORAMA.—The exhibition of a new picture has been opened at the Diorama in Paris. It is painted by M. Daguerre, and represents the Hôtel-de-Ville, on the 28th of July, 1830. The picture of the Deluge is about to be sent to London.—*Le Globe.*

MUSIC.

PHILHARMONIC SOCIETY.

ON Monday last, the first of the annual series of these performances took place in the King's Concert Room, Haymarket, before a very numerous audience.

The *Eroica*, Beethoven's third symphony, is a work as stupendous as it is difficult, and is seldom performed without some partial failure, as was the case on the present occasion, when, owing to the *scherso* having been taken too quick, the horns were out in the trio. The same may be said of the overture to *Don Giovanni*, which was also performed too much *à la chasse*. In every one of Beethoven's symphonies, except the first two, which are uniform throughout, there is one favourite movement much superior to the others; so in the fourth and seventh, the andante in the C minor the last movement; and in the *Eroica* it is undoubtedly the funeral march. Even the poet's pen might vainly endeavour to give an adequate idea of the intensity of feeling and grandeur of this wonderful production. Every one of the pieces performed was of the German school, and Spohr appears three times on the programme. From the predilection of the Germans for the instrumental, their vocal compositions encroach now and then too much upon the sister department; and their accompaniments are frequently so much at work, that one hardly knows whether the orchestra accompanies the voice, or the voice the orchestra. Spohr himself is not free from this fault; nor Beethoven, as was clearly perceivable in the "Terzetto Tremate," from *Fidelio*. Otherwise the duetto from the *Berggeist* is finely composed, and though fully performed according to its merits, it did not please. Hummel's military septetto was the most prominent novelty of the evening. It is a fine composition, no doubt, but not equal to the first septetto of the same author. Without being in the least influenced by the frequent bravos so excellent a judge as Mr. John Cramer bestowed on Mrs. Anderson during this piece, we have no hesitation in saying that it was her *chef-d'œuvre*. She gave the spirit of that composition in a manner which would have delighted the composer himself. The delicacy of expression in all the feeling passages, and the animation with which she played the lively parts, produced an effect which gained her the most flattering applause after every movement. It is needless to say how she was assisted, considering the names of the masters who accompanied her.* The overture to *Euryanthe* could not have been performed better. Madame Stockhausen was enthusiastically applauded for her excellent execution of the beautiful scena, "Mi sospiro." Spohr's double quartetto, which was played with no very great success last year, gave, on this occasion, universal satisfaction; the principal violin being in the hands of M. Mori, and the other instruments in those of performers also distinguished in their depart-

ments.* Many would take the "Tremate" of Beethoven for a work of Mozart; and it would be perfect if it were less crowded with accompaniments, and had a more striking melody. The whole concert, under the excellent direction of Messrs. John and Francis Cramer, was a high musical treat.

THE ORATORIOS.—The *Messiah* at Covent Garden on Wednesday was admirably given throughout.

THE APOLLONICON.—Among the musical treats of Lent, we know of none more attractive than the Wednesday performances of the Apollonicon. Harmony from mechanism is a curious production; but when it rises to the power and sublimity of this extraordinary instrument, and delights us with the noblest compositions of the science—it is wonderful. Mozart's overture to *Idomeneo*, and Weber's to *Oberon*, are surprising in combination and effect.

DRAMA.

AT Covent Garden, *Much Ado about Nothing* has been frequently repeated to full and applauding audiences. At Drury Lane, the great dramatic event of the week has been a royal visit on Tuesday. The house was brilliantly attended; and the representations on, as well as the loyal play off, the stage, were most gratifying.

ADELPHI.

ON Thursday, a comic burletta, called *Kind Intentions*, and from the pen (we believe) of his son, afforded Mr. Mathews an opportunity of appearing in one of his best original characters. He enacts a *Mr. Meanwell*, who, with the best purposes in the world, throws every thing into confusion and every body into distress. His consequent embarrassments and regrets are admirably delineated; and we have thus another very popular piece (and of a different character from the others) added to the strong list at this most attractive little theatre. Wilkinson, as a footman, has also an amusing part, in which he makes a very humorous figure.

OLYMPIC.

BOIELDIEU'S elegant little opera *Le Nouveau Seigneur* has been produced here, with some improvement and well-merited success. A translation, by the Hon. G. Lamb, was performed at Drury Lane some years ago, called *The Man his own Master*; but though a lively farce, and pleasantly acted by Harley, the omission of the tasteful and characteristic music of Boieldieu was grievously annoying to those who were acquainted with the original. The pieces most effective for the English stage have, in this instance, been retained; and an opening chorus, and an air for Madame Vestris, —the latter adapted from the popular finale to *Michel et Christine*,—introduced by the present arranger, Mr. Livius. Madame Vestris, instead of the original valet, is a page, whose assumption of his master's rank gives the title to the piece of a *Duke for a Day*. Miss Sydney played *Aline*, daughter of the Duke's senechal, enacted by Mr. W. Vining; and Cooper and Newcombe sustained the characters of two rival cousins. The well-known duets, "Où, c'est du Chamberlin," and "Si vous restez," were very effective in the hands (or rather the mouths) of Madame Vestris, Miss Sydney, and Mr. Newcombe. The choruses were also well sung. The *Duc de Valmont* found but a sorry

* Messrs. Mori, Lindley, Dragonetti, Nicholson, Williams, and Harper.

* Spagnoletti, Moralt, Lindley, Watts, A. Griesbach, Lyons, and Dragonetti.

representative in Mr. Hodges. This gentleman has a sweet voice, but he is a most intolerable walking-stick. The scenery, by Mr. Gordon, is very picturesque; and the dresses, in point of character and magnificence, we have rarely seen equalled in London.

FRENCH PLAYS.

Jeune et Vieille, the first performance on Monday night, introduced Madlle. Jomain to a London audience. In the early portion (the first act), in which she is the young and blooming Rose, her acting is charming; and even in the second act, when forty years have elapsed, and she meets her original lover again, both having meanwhile grown old in absence, she displayed very amusing talents. She is a welcome accession to the company. Laporte was excellent throughout; but in the latter part perfect. His chagrin and astonishment at the reception he meets with from her, of his long-cherished fancies, are as admirable as any thing of the kind upon the stage. The other pieces were, *André le Chansonnier* and *Quoniam*, in both of which M. Bouffé grew greatly into favour. The touches of feeling in the former, and the sheer comic humour of the latter, deserve no less a meed. We are, therefore, glad to see these lively representations becoming every night more fashionable.

As is usual, theatre running against theatre, instead of devising separately what is most likely to please the public, we hear that Spohr's *Selima* and *Azor* is in rehearsal at Covent Garden, and Mozart's *Zauberflöte* at Drury Lane!

VARIETIES.

Mortality among Leeches during Storms.—That atmospheric changes have a remarkable influence upon leeches, is a well-known fact. In 1825, M. Derheims, of St. Omer, ascribed the almost sudden death of them, at the approach of or during storms, to the coagulation of the blood of these creatures, caused by the impression of the atmospheric electricity. This opinion, which, at that time, was the result of theory, he confirmed during the summer of last year by direct experiment.

*Mrs. ***.* The newspapers contain a statement, which we earnestly hope is not true; namely, that a lady, celebrated for her literary productions, and no less for having enacted what (after their public effect) was deemed the part of a Modern Dame of Ephesus, has found the foreigner, to whom she resigned her widowed heart, in the possession of a prior wife. If this be true, it is a lesson to our females how they form engagements with foreigners: few such matches turn out well.

York Minister.—It is stated, in the York newspapers, that after all the bickering which has taken place, the choir-screen in this cathedral is to remain *in statu quo*. As the dispute, like all disputes on matters of taste, ran high, we took no part in it; and now, as non-combatants, have only to remark, that, according to Smirke's engravings, the removal must decidedly have added to the grandeur and beauty of the architecture. The question whether this improvement of one part should be obtained at the cost of another, and that of so fine a remains of antiquity as the screen itself, it is not in our power to determine.

Cholera Morbus.—This disorder appeared at Tera, in Russia, in the autumn of 1829. It was suspended during the winter; but, reviving in the spring, spread on the shores of the Caspian Sea, and reached Astrachan. On the 8th

of August, 1829, it appeared for the first time at Tiflis, and attacked three soldiers of the garrison. Doubts were at first entertained of the nature of the malady, but by the 13th those doubts ceased. The affrighted population sought for a remedy against this new scourge, in religious processions. These, by assembling so many persons, among whom some were already infected, propagated the disorder. It augmented prodigiously, carrying off hundreds in less than eight hours after their first attack. All medical aid proved unavailing; and in less than a twelvemonth the number of the inhabitants was reduced from 30,000 to 8,000! At Tauris above 5,000 persons have already fallen victims either to the cholera morbus or to the plague; for both those disorders are raging there together. The greatest precautions ought to be adopted to prevent this dreadful malady from invading the whole of Europe, to which it has, in former times, extended its ravages. In the years 1362, 1363, 1379, and 1380, it raged at Augsburg, under the name of the vomiting sickness. It appears that even in 1653 an establishment was formed out of that town, entitled the Vomiting Hospital; as well as a cemetery, the graves of which were ordered to be six feet deep. Recent news from Swedish Finland states that the cholera morbus has shewn itself in the neighbourhood of Wilmanstrand.

Salicine.—M. Leroux, an apothecary at Vitry-le-François, has established the means of producing large quantities of this new medicine for general consumption.

Vitalism.—The physiologists in France are divided in their opinions. The one party, attaching themselves to physico-chemical researches, endeavour to shew, in all the phenomena which appear in living bodies, the application of the general laws which govern matter; the other party hold that organised beings are not only subject to the action of the forces which operate upon bodies, but that they are further subject, during the whole of their lives, to the action of forces of a particular nature, which they denominate "vital forces." M. Geoffroy Saint-Hilaire lately read to the French Academy a paper, in which he defends the former opinion.

Flying Machine.—A projector, of the name of De la Porte, lately submitted to the French Academy a plan of a flying machine, capable of being worked by hand, by mechanical means, or even by steam! A committee of the Academy, to whom the plan was referred for consideration, have pronounced an unfavourable opinion upon it.

Iodine.—The most satisfactory results have been produced at the hospital of Saint Louis, in Paris, by the administration of preparations of iodine in scrofulous cases, even of the most desperate character.

Saramelodicon.—The name given to his invention by a M. Backstein, of Cassel, who strikes flints together with so much skill as to produce very agreeable sounds.

Royal (alias sans culotte) Condescension.—A few days since L— left town in a great hurry for Brighton, where, passing along the Steyne, he met the king. His majesty, with his usual frank urbanity, accosted him as an old acquaintance. "Ah, L—, how are ye? what brings ye here? how long do ye stay?" L— replied, he came to see a sick relation, and was obliged to return the ensuing day. "Pooh, pooh, pooh," said his majesty, "you must dine with me first." "Please your majesty, I am under the necessity of returning immediately." "Nonsense! come to-morrow. Sir Herbert, do you mind, L— does not go away without

dining with me." L— whispered to Sir Herbert that it was quite impossible he could avail himself of the honour, for he was deficient in a certain article of dress. Sir Herbert overwhelmed poor L—, by at once informing his majesty of his reason for declining the honour, namely, that he had no breeches. "Nonsense—ceremony—stuff—let him come without—let him come without," said the king.

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. IX. Feb. 20.]

The Albanians, a Dramatic Sketch, to which are added Miscellaneous Poems, by George J. Bennett, Theatre Royal Covent Garden.—Valpurgis; or, the Devil's Festival, with Illustrations by R. Seymour.—Mr. Martin is, we are informed, engraving two Prints, "Satan presiding at the Infernal Council," and "Pandemonium," on the same scale as the "Belshazzar's Feast."

LIST OF NEW BOOKS.

Coster's Manual of Surgery, by Fife, 12mo. 7s. 6d. bds.—Henson's Young Christian's Guide, 18mo. 2s. 6d. bds.—Tulleries, a Tale, 3 vols. post 8vo. 11. 11s. 6d. bds.—Burkhardt's Customs of the Modern Egyptians, 4to. 11. 5s. bds.—Lover's Legends and Stories of Ireland, 12mo. 7s. 6d. bds.—Wilson's Trigonometry, 8vo. 10s. 6d. bds.—Jamieson's Modern Geography, 8vo. 18s. bds.—Bent's London Catalogue, corrected to February 1831, 8vo. 14s. bds.—Nolan's Time of the Millennium, 8vo. 8s. bds.—Napier's War in the Peninsula, Vol. III., 8vo. 11. bds.—Money's Vade Mecum of Morbid Anatomy, royal 8vo. 11. 5s. bds.—Armstrong's Journal of Travels in the Seat of War, 8vo. 10s. 6d. bds.—Year in Spain, by a Young American, 2 vols. post 8vo. 16s. bds.—Marchmont Papers, selected by Sir G. H. Rose, 3 vols. 8vo. 11. 16s. bds.

Number of days of rain and snow, 15.
Quantity of rain and melted snow in inches and decimals, 2.721.

Winds.—6 East—1 West—6 North—1 South—6 North-east—4 South-east—1 South-west—6 North-west.

General Observations.—The month was warmer than in the last two years; but the range of the thermometer was not so great. The mean of the barometer was higher than that of January last year, and the maximum above any in the corresponding months since 1826. Snow fell on the 27th and 31st—the whole depth only 3.6 inches; the rain and melted snow measured 2.721 inches, being more, excepting in 1828, than for the last seven years. The most splendid aurora borealis that has been seen in these parts for the last thirty years, was observed on the evening of the 7th, about seven o'clock: the whole of the atmosphere, from the E.N.E. to the N. was brilliantly illuminated by a deep yellow light. From the first-mentioned point several curved and divergent rays issued—at intervals streams of a grayish blue light shot up, with great velocity, and, passing the zenith, vanished in a few seconds. These appearances continued for nearly an hour when the radii assumed a deep red tint, and the whole light spread further to the westward. At one time two red rays took the shape of a very pointed arch, like that of a lancet window. With little variation as to form and brightness, the rays and light continued until past nine o'clock, still extending more to the westward, and reaching from the E.N.E. to the W.S.W.; after this hour the aurora gradually became fainter, but had not entirely disappeared until after midnight.

TO CORRESPONDENTS.

A mass of private correspondence is reluctantly left unattended to this week. Some of our public returns must also stand over.

ADVERTISEMENTS,

Connected with Literature and the Arts.

BRITISH INSTITUTION, Pall Mall.

The Gallery for the Exhibition and Sale of the Works of British Artists is Open Daily, from Ten in the Morning till Five in the Evening.

Admission, 1s.—Catalogue, 1s.
WILLIAM BARNARD, Keeper.

BY MR. HODGSON, at his Great Room,

No. 125, Fleet Street, on Thursday, March 2d, and Friday, March 3d, commencing at Twelve o'clock precisely, a valuable and splendid Collection of Books, Prints, Books of Prints, and Illustrated Works; the Library of a Gentleman going Abroad, among which are—

Folia.—The Stafford, Houghton, Tomkins, and Forster Galleries, India Proofs—Cook's Pompeii, 2 vols.—History of Buckinghamshire, illustrated—Phylogie Sacré, 8 vols.—Macklin's Bible—Voyage Pittoresque de Naples, Sicile, et de la Suisse, 7 vols.—Dugdale's Warwickshire—Musée Français, 4 vols.—Atlas Universel, par Vandermaelen, 6 vols.—Stuart's Athens, 4 vols.—Histoire de l'Art par les Monumens, 6 vols.—302 coloured Botanical Drawings—Thoresby's Leeds, 2 vols. printed on India paper. *Quarto*.—Vetus Testamentum Græcum, curâ Baber, printed on Vellum, 6 vols.—Britton's Architectural Antiquities, 4 vols. large paper—Reyn's Cyclopædia, 43 vols.—European Sceneries, 7 vols. large paper—Lycæum's London illustrated, 10 vols.—Encyclopædia Metropolitana, 30 Parts.

Octavo.—40s.—Dodley's Annual Register, 73 vols.—Lodge's Portraits, 40 Parts—Gentleman's Magazine, 142 vols. uncut—Auctores Classici Græci et Latini, 150 vols.—Universal History, 63 vols.—Biographie Universelle, 12 vols.—Donovan's Fishes, Shells, Birds, Insects, and Quadrupeds, 30 vols.—Beauties of England and Wales, 25 vols.—Galerie du Musée de France, 10 vols.—many in superb bindings of morocco, rusia, and calf.

A handsome Spanish Mahogany Book-case; a ditto Secretaire and Book-case; and an Egyptian Manuscript on Papyrus.
To be viewed, and Catalogues had.

LITERARY GAZETTE.—Thirteen Vols.

In handsome Half-binding, to be sold.
Inquire of Mr. Farlow, Stationer, Throgmorton Street.

MUSIC.

New Songs by Mrs. Hemans.

A SET of SIX ORIGINAL SONGS, the Poetry by the above Lady; the Music by J. Zeugheer Hartmann, and H. F. C. Price 10s. 6d. Containing—

Far away! O lonely Bird
Plaster! since I met thee last Dirge at Sea
Pilgrim's Evening Song The Lyre and Flower.

Published by J. Power, 24, Strand.

MADAME VESTRIS'S NEW SONGS

CHANGE OF AIR; or, the Pursuit of Health: an Autumnal Excursion through France, Switzerland, and Italy, in the Year 1839; with Observations and Reflections on the Moral, Physical, and Medicinal Influence of Travelling, Exercise, Change of Scene, Foreign Skies, and Voluntary Expatriation, in Sickness and in Health.
By JAMES JOHNSON, M.D.
Physician Extraordinary to the King.
Printed for S. Highley, 174, Fleet Street; and T. and G. Underwood, 35, Fleet Street.

London and Parisian Society.
Lately published by Henry Colburn and Richard Bentley, New Burlington Street.

THE CLUBS OF LONDON, with Anecdotes of their Members, Sketches of Character and Conversation. In 2 vols. post 8vo. 18s.

"Two very sprightly volumes for readers of every degree."
Monthly Review.

"This is an excellent book."—*Scotsman*.

St. James's; a Satirical Poem, in Six Epis-
des, addressed to Mr. Crookford. 3d edition, 8vo. 6s.

A Second Portraiture of Exclusive Society;
or, Foreign Exclusives in London. A Novel. 3 vols. 12mo. 21s.

Ecarté; or, the Salons of Paris. In 3 vols.
post 8vo. 22s. 6d.

"The work under this title must not be considered as a fiction. It was sketched in the midst of the dissipated scenes which form its subject. We are assured that imagination has not been called in aid; for every incident and scene was witnessed, and every character is from the life."—*Globe*.

The Hermit in London; or, Sketches of English Manners. New edition, 3 vols. 18s.

"Tis pleasant through the loop-holes of retreat
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."—*Comper*.

The Ball; or, a Glance at Almack's. Post
vo. 7s. 6d.

Babylon the Great; or, Men and Things in
the British Capital. 2d edition, with Additions. In 2 vols. post
8vo. 18s.

"These volumes treat of all subjects connected with London, from the 'forest of masts' in the river, to the elegance of the corporation; from the Chapel of St. Stephen's, to the steam-press in Printing-house Square; men, women, books, and newspapers; every thing in and about London that is worthy of notice in an intellectual point of view. He has studied the character of London and Londoners with acuteness."—*Atlas*.

A new edition, 3 vols. small 8vo. 10s. 6d. half-bound.

BERTHA'S JOURNAL; comprising

A Variety of Interesting Information for Young Persons.
Arranged for every Day in the Year.

"We have seldom had occasion to notice a work more replete with amusing and diversified information, conveyed in an agreeable style and adapted to juvenile minds. We are much mistaken if many are not allured to the acquisition of knowledge by a perusal of these volumes. We can recommend the work most earnestly to those who wish to place an interesting book in the hands of youth."—*Astoria Journal*.

"It is with sincere pleasure that we have perused these volumes, which, with all the clearness and accuracy of Mrs. Marcet's justly celebrated conversations, have a familiarity and elementary simplicity about them, that at once qualify them for, we had almost said, the exclusive perusal of more advanced children. No head of a family, we presume, will think of dispensing with this work, at least no one that is anxious to invigorate the minds of his children by communicating to them an early taste for the more valuable and profitable pursuits of the human understanding."—*Monthly Review*.

"Four les enfants dont l'esprit actif réclame de nouveaux aliments, la Visite de Bertha sera une mine précieuse, ou leur curiosité trouvera sans cesse de quoi se satisfaire—on annonce comme devant paraître incessamment une traduction de ce livre."—*Revue Encyclopédique*.

"Of the little works contrived of late years for the purpose of conveying information to young folks in an attractive manner, this, we think, will prove by far the most successful."—*Monthly Magazine*.

"An admirable production of its class."—*Court Journal*.
"An interesting present for young people. The book is extremely cheap, only half-a-guinea for three volumes."—*Standard*.
"A great variety of information is here pleasantly collected."—*Literary Gazette*.

SYLLABIC SPELLING; or, a Summary

Method of Teaching Children to Read, upon the Principle originally discovered by the Sieur Berthoud. Adapted to the English Language, by Mrs. WILLIAM M. N.B.

This edition contains a variety of testimonials in favour of the system, from some of the most respectable professors of the English language, as well as from several parents, whose children (amused and interested by this novel mode of instruction) have learned in the course of a very few months to read correctly, and with perfect ease, the longest and most difficult words.

Boxes, with appropriate Counters, for amusement of Young Beginners, may be had, if required, of the Publishers.
Printed for Whittaker, Treacher, and Co. Ave Maria Lane.

Of whom may be had, by the same Author,

Conversations on English Grammar, in a

Series of Familiar and Entertaining Dialogues between a Mother and her Daughter, in which the various Rules of Grammar are introduced and explained, in a manner calculated to excite the attention of Children, and at the same time to convey to their minds clear and comprehensive ideas of the general principles of Language. 4th edition, 2s.

Poetical Works and Memoirs.

Just published, by Henry Colburn and Richard Bentley, New Burlington Street.

THE LOVES OF THE POETS.

By the Authoress of the "Diary of an Ennuyée."

In 3 vols. post 8vo. 12s.

"Very delightful volumes."—*Blackburne's Magazine*.

"The volumes are admirable: they confirm conceptions which are amongst the most brilliant and charming in the range of literary history."—*Atlas*.

The Poetical Works of the Rev. George

Croly, M.R.S.L. In 2 vols. post 8vo. with Illustrations, 21s.

"Full of lofty imaginings and poetic thought, we will venture to say that there is hardly a theme which Mr. Croly has not awoken to with a masterly hand, and hardly a sympathy which he has not beautifully touched in the great and multifarious range of subjects embraced in these volumes. Thus enriched, we most cordially recommend them to that universal attention which they will repay abundantly by the pleasure they are so well calculated to yield."—*Literary Gazette*.

The Poetical Works of Barry Cornwall, now

first collected, in 3 vols. small 8vo. 12s.

Also, a new edition, separate, to complete Sets, price 7s. of

The Flood of Thessaly, the Girl of Provence, and other Poems.

Woman, a Poem. By E. S. Barrett, Esq.

New edition, beautifully embellished with Engravings, from Designs by Westall. small 8vo. 6s.

"Mr. Barrett has evinced both talent and genius in his little poem. Some passages of it, and those not a few, are of the first order of the pathetic and descriptive."—*Quarterly Review*.

The Pleasures of Conversation, a Poem. By

William Cooke, Esq. New edition, small 8vo. 5s. 6d.

The Bride, a Drama. By Johanna Baillie,

Authoress of "Plays on the Passions." 2d edition, 8vo. 4s. 6d.

Memorials of Shakspeare; or, Sketches of

his Character and Genius. By Sir Walter Scott, Campbell, Coleridge, Godwin, Mackenzie, Cumberland, Warton, Dryden, Goethe, the two Schlegels, Madame de Stael, and other eminent Writers. Edited with Preface and Notes, by Nathan Drake, M.D. &c. In a large vol. 8vo. forming a valuable Accompaniment to every edition of the Poet, 10s. 6d.

"The design and execution of this volume are admirable."—*Gentleman's Magazine*.

"Dr. Drake has collected a variety of particulars which cannot fail to be interesting to every reader of the bard."—*Athenæum*.

Price 11. 5s. in boards, and 11. 10s. in silk, illustrated by 50 Vignettes.

I T A L Y. A Poem.

By SAMUEL ROGERS, Esq.

T. Cadell, Strand; and E. Mozon, 64, New Bond Street.

Sets of Proofs to be had of Moon, Boys, and Co. 6, Pall Mall.

Mr. Buckingham's New Work.

8vo. edition, in 2 vols. with Map and 85 Plates, 11. 11s. 6d.

TRAVELS IN PERSIA, including a Journey

from Bagdad by Mount Zagros to Hamadan, the Ancient Ecbatana—Researches in Ispahan during a stay in that City—a Visit to the Ruins of Persepolis—A Voyage down the Persian Gulf—and Passage by the Arabian Sea to Bombay.

By J. S. BUCKINGHAM, Esq.

Author of "Travels in Palestine," in "Mesopotamia," &c.

"These volumes may be pronounced more interesting than any of Mr. Buckingham's former travels, as they chiefly consist of personal narrative."—*Monthly Review*.

"The volumes contain a good deal of information respecting the towns in the Persian Gulf, which we have little doubt merchants will find interesting and useful."—*Edinburgh Gazette*.

Also, by the same Author,

Travels in Palestine, through the Countries

of Bashan and Gilead, East of the River Jordan, including a Visit to the Cities of Geraza and Gamala, in the Decapolis. 2d edition, 8vo. 8s. with numerous Engravings, 21s. 6d.

Travels in Mesopotamia, including a Journey

to the Ur of the Chaldees, and the Ruins of Nineveh and Babylon. 2d edition, in 2 vols. 8vo. with 25 Engravings, 21s. 6d.

"One of the most valuable contributions that have been made in modern times, to our knowledge of the ancient and modern state of Asia."—*Globe*.

Printed for Henry Colburn and Richard Bentley, New Burlington Street.

16mo. 8s. bound in canvass.
THE INFANT'S DAILY SACRIFICE;
 A Book of short Hymns for Children. With Plates.
 "A sweet little book of short hymns for children, and adorned with many appropriate plates. It is a delightful composition, in the purest, the kindest, and the most truly Christian spirit—pious without austerity, and admirably calculated to make a right impression on the minds of children."—*Literary Gazette*, Jan. 15, 1851.
 Printed for J. Hatchard and Son, 107, Piccadilly.

In 1 thick vol. third edition, much enlarged and improved, 1s.
MODERN DOMESTIC MEDICINE; or,
 A Popular Treatise, exhibiting the Nature, Symptoms, Causes, and most efficacious Treatment of all Diseases. Containing also a copious Collection of approved Prescriptions, Medical Management of Children, Rules of Diet, Virtues and Doses of all Medicines, &c. The whole forming a clear and comprehensive Medical Guide for the Use of the Clergy, Families, and Invalids.
 By T. J. GRAHAM, M.D. &c.

"We conscientiously recommend it. It is very far above the celebrated Buchan's; and we shall preserve the volume as the advice of an invaluable friend, to which we can refer in the hour of need, without any doubt of being benefited by its wisdom."—*Literary Chronicle*.

"In the opinion of a respectable physician, well known in our connexion, it is enriched with much of all that modern practice has ascertained to be valuable, and is not only incomparably superior to Buchan's, but also to every similar work in our language."—*Watson's Magazine*.

"It is altogether deserving of permanent popularity."—*London Weekly Review*.
 "It is one of the very best and most useful books published in modern times."—*Monthly Atlas*.
 Published by Simpkin and Marshall, London; and sold by all Booksellers.

Also, by the same Author, 8d. edition, revised and enlarged, price 8s. 6d.

2. A Treatise on Indigestion; illustrating the Symptoms, Varieties, Causes, and correct Treatment of the prevailing Disorders of the Stomach and Liver; with Practical Observations on some Painful Complaints originating in those disorders, as the Douleur, Gout, Fulness of Blood in the Head, &c.

"We sincerely recommend it, and have long been convinced that such a work was imperatively called for."—*London Medical Journal*.

"It is very evidently the result of close attention to, and deep experience in the subject. Mr. Abernethy speaks of it in terms of high praise."—*British Magazine*, Jan. 1850.

The 8d. edition, corrected and enlarged, price 15s. boards, of
A PRACTICAL TREATISE on the DISEASES OF THE SKIN, arranged with a View to their Constitutional Causes and Local Characters, and including the Substance of the Essays on these Subjects to which the Royal College of Surgeons awarded the Jacksonian Prize.

A cheap edition, being the 3d. small 8vo. 6s.

FINANCIAL REFORM.

By Sir HENRY PARNELL, Bart.

"The whole of this work has been carefully revised, and several important additions have been introduced, comprising, among others, the following Subjects—the Duties on Cattle, Horses, and Sugar—the Corn Laws, Government Manufactures, Collection of the Revenue, French System of Public Accounts, the Civil List, &c.

To which are added, Tables of the Civil List Payments, and of Salaries above 1000l.; together with a very complete Index.

"Sir Henry Parnell's admirable work, to which we have now more than once directed the attention of our readers, is—'Financial Reform.' It is a rapid survey, clear, ingenious, and diversified."—*Quarterly Review*.

"No book ever appeared on financial topics bearing with it a greater claim to attention than this."—*Westminster Review*.

John Murray, Albemarle Street.

In 3 vols. 8vo.
A SELECTION from the PAPERS of the EARL of MARCHMONT, illustrating Events from 1685 to 1750; in the possession of the Right Hon. Sir G. H. Rose.

These volumes contain many original Letters from some of the most celebrated characters of the time; among others, from Lord Bolingbroke, Mr. Pope, Sarah Duchess of Marlborough, Sir William Wyndham, Lord Shaftesbury, the great Lord Chesham, John Duke of Argyll, Lord Cobham, the Duke of Montrose, &c.

The work throws much light on the following interesting events:—the ill-fated Expedition of the Earl of Argyll—the Landing of William III.—Battle of the Boyne—Union with Scotland—Rebellion of 1745.—&c. &c.

John Murray, Albemarle Street.

Albemarle Street, Feb. 11, 1851.

Latest published by Robert Cadell, Edinburgh; and Whittaker and Co. London, a 3d edition of

TRAVELS IN CANADA AND THE UNITED STATES OF AMERICA.

By CAPTAIN BASIL HALL, R.N. F.R.S.

And, in a separate Volume,

Forty Illustrative Etchings, drawn with the Camera Lucida.

The Author's chief object in visiting America was to examine the Institutions of the United States, in order, if possible, to remove some portion of the prejudice existing against that nation, so generally felt by his countrymen, but of which he himself was quite free at the outset of his journey; in fact, he was actually predisposed the other way.

He was obliged to confess, however, after many struggles between the evidence of his senses and his anxious wish to find things right, that the task he had undertaken was hopeless; since there appeared no possibility of establishing any cordial union of political sentiment between two countries differing so much from one another in all the essential attributes which go to the formation of national character.

On making this painful discovery, his purpose, necessarily, took a different direction, and he occupied himself in observing the facts of the case with all the care and impartiality which he was master—no man with a view to remove what is called prejudice, as to clear away many egregious errors respecting the actual state of things in America.

On returning to England, with his views and his feelings thus entirely changed, the author had nothing left for it but to tell the story of his disappointments as candidly as possible; and if not to satisfy, at least to explain, his apparent inconsistency, by describing the unexpected facts which met his eye, during more than a twelvemonth of patient investigation on the spot.

He was, above all things, struck with the evil consequences of placing all the power of the state in the hands of one branch of the community, to the exclusion of all the others. And he has endeavoured to shew, that although the democratical part of the body politic, when retained in its right place, is eminently useful in preserving that equilibrium in society which is most favourable to the extension and maintenance of genuine freedom; yet, when it quits its proper station, and claims the exclusive authority, it amounts, in many respects, to an absolute despotism.

That the right chord has been struck, in describing and in commenting upon the singular state of America at this moment, seems apparent to the ordinary reader, and the work by those parties in England who are not content to remain in their natural places, but desire to imitate their brother democrats and reformers across the Atlantic, in the usurpation of the whole sovereign authority, to the utter extirpation of the other estates of the realm—the monarchy—the aristocracy—and the aristocracy. These people, indeed, little dream of the intolerable misery which a compliance with their wishes would soon bring, not only on the objects of their jealousy, but upon their own class, which, after all, is perhaps more deeply interested than any other in maintaining untouched the present order of things.

Price 3s.

ALFIERI'S MEROPE, a Tragedy, with an Analytical and Interlinear Translation, on the Hamiltonian System.

By Mrs. MERRINGTON.

Daughter of the late Mr. Hamilton.
Published and sold by J. Souter, School Library,
78, St. Paul's Churchyard.

BOOKS IN THE PRESS.

Family Library of French Classics.

MESSRS. TREUTTEL, WURTZ, and Co.

will commence the publication, early in March, of a French Family Library, in 8vo. with Portraits, on a Plan of unprecedented cheapness and elegance. Prospectuses and Advertisements will be issued in a few days. Orders received by all Booksellers in Town and Country.

20, Soho Square, Feb. 1854, 1851.

Early in the Spring will be published, a new Monthly Periodical, entitled

THE ENGLISHMAN'S MAGAZINE.

Announcing the appearance of a new Magazine, intended to be essentially different from any at present published, the Proprietors deem it necessary to state, briefly but explicitly, the object of their undertaking.

At a period when most of the Magazines are identified with opinions directly opposed to the true interest and ancient desire of the people, the want of another Monthly Periodical, adapted to the spirit of the times, is too obvious to require explanation. The field is evidently open for a Magazine conceived in rigid honesty of purpose, and executed with ability, energy, and good faith.

In Politics it will always be the endeavour of the Proprietors to increase the sum of knowledge, virtue, and happiness among mankind, and to uphold the cause of reason and liberty in whatever guise it may claim their advocacy. At the same time, to prevent the possibility of misconception, it is proper to state, that they consider the want of an honest Journal rather judiciously to direct the enthusiasm of the people, than to pervert and inflame it. Should the day unhappily arrive when the numerical scale be opposed to the intellectual force of the country, the "Englishman" will be found at his post—on the side of reason, consistency, moderation, and national honour.

As a Critical Journal, the "Englishman's Magazine" will found its claims to support upon firm and fearless integrity, seconded by the industry of enlightened and able men, whose co-operation has been secured. In the several departments of elegant literature, the Proprietors are enabled, by facilities peculiarly their own, to give to the world the dignity of literature—an unfailing variety of instructive and entertaining contributions from English, Continental, and American sources; including, from time to time, the wild fictions and romantic chronicles of Scandinavian and German growth, many of which well deserve to be naturalised on English ground.

The Fine Arts will receive especial attention; and in connection with this department of the work will be introduced, a series of effective engravings, illustrative of the scenery, architecture, costumes, and pastimes of Italy.

Finally, while the object of that amusement and information are the main business of a popular Magazine, the more serious object of this undertaking will be to expose, wherever they exist—in church and state, in art and science, in politics and letters—quackery, dishonesty, and cant—to raise humble merit to protect and encourage genius—acquire the dignity of literature—and to promote sound and enlightened views on every subject that comes within the scope of a Magazine.

London: Hurst, Chance, and Co. 65, St. Paul's Churchyard.

Montgomery's New Poem.

On the 10th of March, small 8vo. 7s. 6d.

OXFORD; a Poem.

By the Author of the "Omnipresence of the Deity."

At the same time, 8s. India Proof, 10s. 6d.

Illustrations for the above, from Drawings

by Joseph Skelton, F.R.S. and other Artists.

Whittaker, Treacher, and Co. Ave Maria Lane, London;

and W. Blackwood, Edinburgh.

National Library.—Series of Standard Novels.

Uniform with the Waverley Novels.

On the 1st of March, beautifully printed and embellished, and neatly bound, price 6s. each Number.

STANDARD NOVELS, No. I. containing

the Pilot, by Cooper, complete, price 6s.

No. II. will contain Godwin's celebrated Story of Caleb Williams, complete, price 6s.

No. III. will contain the Spy, by Cooper, complete, price 6s.

According to the Prospectus issued some time since, the present collection will consist solely of those works of fiction which have been established in public estimation by the unerring voice of fame; and to the novels of each writer will be prefixed a biographical and critical Essay.

Printed by Henry Colburn and Richard Bentley, New Burlington Street; and sold by every Bookseller throughout the Kingdom; Agents for Scotland, Messrs. Bell and Bradfute; and for Ireland, John Cunningham.

Next week, in 3 vols.

THE KING'S SECRET will come out!

"Give it an understanding, but no tongue."—Shakespeare.

Now ready,

2. The Anatomy of Society. By Mr. St. John. In 3 vols. 18s.

3. The Romance of History—France. From the time of Charlemagne to Louis XIV. inclusive. By Leitch Ritchie. 2d edition, 3 vols.

4. The Way of the World. By the Author of "De Lisle." 8 vols.

5. Chatterley, the Fatalist. By a Contributor to Blackwood. 8 vols.

"This is a valuable novel."—Spectator.

6. The Game of Life, a Novel. By Leitch Ritchie. 3 vols.

"Strong and vivid pictures of actual life."—Literary Gazette.

7. Tales of the Five Senses. Edited by the Author of the "Collegians." 1 vol.

"A valuable and entertaining volume."—University Magazine.

8. No. XI. of the Family Cabinet Atlas, to be completed in one more Number, comprising altogether, One Hundred Maps, &c. from Steel Engravings. Price 2s. 6d. plain, and 3s. 6d. finely coloured.

Printed for Edward Bull, New Public Subscription Library, 26, Holles Street, Cavendish Square.

On Monday next, a 3d edition, with a fine Portrait, from Romney's celebrated Painting, in 9 vols. 8vo.

THE LIFE OF MRS. JORDAN.

By JAMES BOADEN, Esq.

"Mr. Boaden has brought into clear view much that was formerly hidden in obscurity and falsehood. He has had the justice and sagacity likewise to let Mrs. Jordan speak for herself. Her letters, which he has inserted, carry the strongest claims to attention, not only as they exhibit touching and frequent traces of the generous goodness of her own extimable heart, but as they dispel, in a great measure, the mist of prejudice which has existed with regard to the deportment towards her, that exalted individual to whom so many links of her destiny are attached."—Courier.

Printed for Edward Bull, New Public Subscription Library, 26, Holles Street, Cavendish Square.

On Monday next, a 3d edition, with a fine Portrait, from Romney's celebrated Painting, in 9 vols. 8vo.

New Spring Present.

Early in March will be published, price 12s.

THE DRAMATIC ANNUAL.

By FREDERIC KEYNOLDS, Dramatist.

This work is on a novel plan, and so far dissimilar from the other Annals, that the Dramatic Annual will be published at a different period, and consist of a continuous Tale—the one of this year to be called a Playwright's Adventures. The volume will be elegantly bound, and embellished with nearly forty highly finished wood engravings, chiefly comic. Published by Longman, Rees, Orme, Brown, and Green.

WAVERLEY NOVELS. New Edition.

Vol. XXII. commencing Keithworth, will be published on Tuesday, 1st March. This Volume has an Introduction by the Author, and is beautifully illustrated by C. R. Leslie, A.R.A.

Vol. III. of the New Issue will also be published on that day. This Volume commences Guy Mannering.

On the 1st of March, the new Issue enables Subscribers to commence with Waverley, and have the Work from the beginning, in monthly deliveries, and without any interruption for all the Volumes of the first Issue which have already appeared.

Printed for Robert Cadell, Edinburgh; and Whittaker and Co. London.

The Publication of

Destiny; or, the Chief's Daughter. A Tale.

By the Author of "Marriage," and the "Inheritance," is unavoidably postponed for some weeks.

Fisher, Son, and Co. will publish on the 1st of March,

THE NATIONAL PORTRAIT GALLERY.

Vol. II. No. 23, containing the Portraits of Lord Tenterden, Sir George Murray, and Dr. Marsh, Bishop of Peterborough.

2. Captain Elliot's Views in the East, Part 7, containing Palace of the Seven Stories, Bejapore, Jahara Bag, Agra, Akbar's Tomb, Secundra.

3. Select Library, Vol. I.; being the First Volume of an improved edition of Polytechnic Researches, by William Ellis.

4. Baines's History of Lancashire, Part I.

5. Devon and Cornwall Illustrated, Part V. and Nos. 19 and 20.

6. Ireland Illustrated, No. 18.

7. Imperial Magazine, No. 3, Second Series, with a View of Holyrood Palace, the present Residence of Charles the Tenth.

WHITTAKER'S MONTHLY MAGAZINE.

ZINE for March will contain—I. The March Night-Thoughts of Gog and Magog—II. Europe and the British Parliaments—III. The Tiger's Claw—IV. Coal Duty and Coal Trick—V. Spanish Highway and Byways—VI. The Letter Bell, by the late William Hazlitt—VII. The Merchant's Club; a Legend of the Old Time in London—VIII. Sir H. Parnell on Financial Reform—IX. A Personal and Political Portrait of Prince Metternich—X. The Duke of Devonshire, a Penetration of Quality—XI. Dublin Saints—XII. Dramatic Copyrights: Theatrical Affairs at Home and Abroad—XIII. Notes of the Month on Affairs in general—Reform and Quarterly Review—The Duke's Healing Measure—Expenses of Insolvency—Orator Hunt—Stanley's Economy—St. John Long—Gudgeon Catching—French Bankers—The Blessings of Peace—Sierra Leone, the Leprous Colony—Metternich's tender Passion—Capt. Swing and Hindoo Burnings—Letter about Lord Rivers—The Irish Agitator—Whig Shuffling—Pimlico Palace again, &c. &c.—Reviews, Fine Arts, Reports, &c.

Whittaker and Co. London; Waugh and Innes, Edinburgh; and J. M. Leckie, Dublin.

THE RIGHT HON. COUNTESS DOW-AGGER OF BRROL.

A Portrait of the distinguished Lady, Countess Dow-Agger, from a Miniature, will embellish the March Number of La Belle Assemblée, being the 78th of the Series of the Female Nobility.

The number will also contain several full-length Figures, brilliantly coloured, illustrative of the prevailing Modes of Fashion, both English and Continental, and executed in the style of excellence that distinguishes the Embellishments of this Publication.

The Literary Department consists of—I. Illustrative and Genealogical Memoir of the Countess Dowager of Errol—II. Lord Chesterfield's Dream—III. My Lady's Album—IV. The Strawberry—V. My First Time—VI. Two Days in the Alps—VII. A Tale of the Pacific—VIII. A Domestic Sketch—with various Poetical Contributions, Descriptions of the Fashions of the Season, Reviews, Fine Arts, &c. &c.

Harrods Durham's beautiful Portrait enriched the February Number; and the following are in preparation: The King and Queen of England, the Empress of Russia—the Marchioness of Stafford—the Countess Gower—Lady Mary Leslie—Lady Normanby—Countess of Antrim—and other illustrious Persons.

Whittaker and Co. London; and may be ordered of all Booksellers in the United Kingdom.

PRICE 8d.

REVIEW OF NEW BOOKS.

History of the War in the Peninsula. By Lieut.-Col. Napier, C.B. Vol. III. 8vo. pp. 640. London, 1831. T. and W. Boone.

If we were called upon to name the department of science which in this country has met with the least attention or encouragement, we should directly answer, the study of the art of war. It seems to have been cautiously avoided by the deep reasoner, the speculative theorist, and the literary aspirant. Volumes we have, out of number, professing to give histories of our great captains, and descriptions of our British "feats in broil and battle;" but it must be acknowledged, looking at war as a grand science, that they are, for the most part, of flimsy construction—offerings to the imagination, not to the head—presenting a heterogeneous mass of confused geography, huddled march and countermarch, towns leaguered, with rockets hissing, shells exploding, soldiers mowing, and crowned with the delineation of combats, much in the pell-mell style of Mr. Cooper's battle-pieces. Humane and moral motives have been adduced to explain this neglect and want of consideration for military art; but they are of little weight, it being universally admitted, that wars have become less bloody, and strife less ferocious, as the means of fighting have improved. We are more inclined to the opinion of its being constitutional in us islanders—for dislike and jealousy of the military pervades all our institutions, and is instilled into us from our cradle: "*any thing will do for a soldier*," is the apology for devoting the impracticable grandson of the family to the profession of arms; the mouthing patriot scares his shuddering infant brood with the bugbear terrors of a standing army; and, in harmony with these, the Mutiny Act, authorising the maintenance of a permanent force, with admirable consistency opens with the declaration of its being contrary to law. Our military system is also clogged by these defects; no qualification, except as to age and size, is required to fit us either for the army—it is not even necessary for him to read or write; and many times of opportunity, *materiel*, and men, in our primary campaigns, are to be attributed to those in command being utterly ignorant of the first principles of their profession. The loving parent restricts his own pleasures, to furnish means for the education of the favourite son who is destined for what is termed a liberal profession; but the scapegrace who has to gain for himself "a name in arms," is permitted to idle away his time till the hour strikes for what is, in many cases, but the gratification of a foolish vanity, which would perhaps have been dissipated, if the measures to make him an accomplished soldier had been duly pursued. Surely it ought to be required that every candidate for a commission should be versed in mathematics, and possess a knowledge of at least one continental language.

We have been led to this digression, previously to laying before our readers a report of the admirable military work before us, being the third volume of Colonel Napier's *History of the Peninsular War*; and to such as are disposed to think lightly of the military in juxtaposition with other professions, we recommend its perusal: it will at once satisfy them by numerous illustrations of the natural endowments and scientific acquirements absolutely requisite to those who have any ambition to "shine in arms."

The earlier pages of this volume detail the final dispersion of the Spanish armies, and the almost entire subjection of Spain; but as the thread of the gallant author's narrative successively unwinds, we open upon events of more powerful interest,—the defence of Portugal by Lord Wellington, the retreat of Massena, and, in conclusion, the battle of Albuera, fought by Lord Beresford. To the latter we shall confine this notice, regretting that we are compelled, by want of space, to omit what appears to us one of the most favourable specimens of the author's style; his clear, distinct, and perspicuous description of the combat of Ocaña, so fatal to the Spaniards, who there proved their total inefficiency, single-handed, to withstand the invader. We, therefore, direct our attention to the eleventh book, which opens with a political tirade, expressed in the writer's usually strong language, ascribing to the ministry of the period (1810) the worst of motives, coupled with glaring ignorance and cowardly timidity. Is the gallant author, like his great chief, so wholly and exclusively a soldier, as to be but an indifferent and shallow politician? or does he suppose that all honour and high ambition for the country's welfare is the property of himself and his companions in arms? That faults were committed by the ministry, candour will admit; but the sin of ignorance is sufficient visitation, without the imputation of dishonourable motives. Their aim was the same as Lord Wellington's, and no less difficult was their part to accomplish: they had obstacles to encounter from a nation whose constitutional prejudices against military expeditions were confirmed by repeated disgraces and discomfitures; and no wonder they hesitated before they threw all into the scale of continental warfare: abler men would, perhaps, have done the same. While on this topic, we cannot forbear noticing the following extraordinary passage, of which sound discretion would, we think, have dictated the omission. If the communication to Lord Wellington was private, its revival is scarcely justifiable; if public, in common justice to the nameless writer, the whole letter ought to have been published. The arrow thus shot, is likely to fix in more than one breast.

"This spirit of faction was, however, not confined to one side; there was a ministerial person at this time, who, in his dread of the opposition, wrote to Lord Wellington, complaining of his inaction, and calling upon him to do something that would excite a public sen-

sation: *any thing, provided blood was spilt.* A calm but severe rebuke, and the cessation of all friendly intercourse with the writer, discovered the general's abhorrence of this detestable policy."

Our present illustration will be the battle of Albuera; and the severe strictures to which it gives rise on the conduct and capacity of Lord Beresford, almost lead us, in the spirit of charity, to wish that time had run a longer course, before history, with pen severe, had recorded these events. After such exposures (if, as they appear to be, justified by facts), no future confidence in a commander can be expected from either officers or men.

"During the night, Blake and Cole arrived with above sixteen thousand men; but so defective was the occupation of the ground, that Soult had no change to make in his plans from this circumstance; and, a little before nine o'clock in the morning, Godinot's division issued from the woods in one heavy column of attack, preceded by ten guns. He was flanked by the light cavalry, and followed by Werlé's division of reserve, and, making straight towards the bridge, commenced a sharp cannonade, attempting to force the passage; at the same time, Briche, with two regiments of hussars, drew further down the river to observe Colonel Otway's horse. The allies' guns on the rising ground above the village answered the fire of the French, and ploughed through their columns, which were crowding without judgment towards the bridge, although the stream was passable above and below. But Beresford observing that Werlé's division did not follow closely, was soon convinced that the principal effort would be on the right, and therefore sent Blake orders to form a part of the first and all the second line of the Spanish army, on the broad part of the hills, at right angles to their actual front. Then drawing the Portuguese infantry of the left wing to the centre, he sent one brigade down to support Alten, and directed General Hamilton to hold the remainder in columns of battalions, ready to move to any part of the field. The thirteenth dragoons were posted near the edge of the river, above the bridge, and, meanwhile, the second division marched to support Blake. The horse-artillery, the heavy dragoons, and the fourth division, also took ground to the right, and were posted; the cavalry and guns on a small plain behind the Aroya, and the fourth division in an oblique line, about half-musket-shot behind them. This done, Beresford galloped to Blake, for that general had refused to change his front, and, with great heat, told Colonel Hardinge, the bearer of the order, that this real attack was at the village and bridge. Beresford had sent again to entreat that he would obey; but this message was as fruitless as the former, and, when the marshal arrived, nothing had been done. The enemy's columns were, however, now beginning to appear on the right, and Blake, yielding to this evidence, proceeded to make the evolution,

yet with such pedantic slowness, that Beresford, impatient of his folly, took the direction in person. Great was the confusion and the delay thus occasioned; and ere the troops could be put in order, the French were amongst them. For scarcely had Godinot engaged Alten's brigade, when Werlé, leaving only a battalion of grenadiers and some squadrons to watch the thirteenth dragoons and to connect the attacks, countermarched with the remainder of his division, and rapidly gained the rear of the fifth corps, as it was mounting the hills on the right of the allies. At the same time the mass of light cavalry suddenly quitted Godinot's column, and, crossing the river Alhüera above the bridge, ascended the left bank at a gallop, and, sweeping round the rear of the fifth corps, joined Latour Maubourg, who was already in face of Lumley's squadrons. Thus half an hour had sufficed to render Beresford's position nearly desperate. Two-thirds of the French were in a compact order of battle, on a line perpendicular to his right, and his army, disordered and composed of different nations, was still in the difficult act of changing its front. It was in vain that he endeavoured to form the Spanish line sufficiently in advance to give room for the second division to support it: the French guns opened, their infantry threw out a heavy musketry, and their cavalry, outflanking the front, and charging here and there, put the Spaniards in disorder at all points: in a short time the latter gave way, and Soult, thinking the whole army was yielding, pushed forward his columns, while his reserves also mounted the hill, and General Ruty placed all the batteries in position. At this critical moment General William Stewart arrived at the foot of the heights with Colonel Colborne's brigade, which formed the head of the second division. The colonel, seeing the confusion above, desired to form in order of battle previous to mounting the ascent; but Stewart, whose boiling courage overhaid his judgment, led up without any delay in column of companies, and attempted to open out his line in succession as the battalions arrived at the summit. Being under a destructive fire, the foremost charged to gain room, but a heavy rain prevented any object from being distinctly seen, and four regiments of hussars and lancers, which had passed the right flank in the obscurity, came galloping in upon the rear of the line at the instant of its development, and slew or took two-thirds of the brigade. One battalion only (the thirty-first) being still in column, escaped the storm, and maintained its ground; while the French horsemen, riding violently over every thing else, penetrated to all parts. In the tumult, a lancer fell upon Beresford; but the marshal, a man of great strength, putting his spear aside, cast him from his saddle; and a shift of wind blowing aside the mist and smoke, the mischief was perceived from the plains by General Lumley, who sent four squadrons out upon the lancers, and cut many of them off. During this first unhappy effort of the second division, so great was the confusion, that the Spanish line continued to fire without cessation, although the British were before them; whereupon Beresford, finding his exhortations to advance fruitless, seized an ensign, and bore him and his colours, by main force, to the front; yet the troops would not follow, and the man went back again on being released. In this crisis, the weather, which had ruined Colborne's brigade, also prevented Soult from seeing the whole extent of the field of battle, and he still kept his heavy columns together,

His cavalry, indeed, began to hem in that of the allies; but the fire of the horse-artillery enabled Lumley, covered as he was by the bed of the Aroya, and supported by the fourth division, to check them on the plain, while Colborne still maintained the heights with the thirty-first regiment: the British artillery, under Major Dickson, was likewise coming fast into action; and William Stewart, who had escaped the charge of the lancers, was again mounting the hill with General Houghton's brigade, which he brought on with the same vehemence, but, instructed by his previous misfortune, in a juster order of battle. The weather now cleared, and a dreadful fire poured into the thickest of the French columns, convinced Soult that the day was yet to be won. Houghton's regiments soon got footing on the summit, Dickson placed the artillery in line, the remaining brigade of the second division came up on the left, and two Spanish corps at last moved forward. The enemy's infantry then recoiled, yet, soon recovering, renewed the fight with greater violence than before; the cannon on both sides discharged showers of grape at half range, and the peals of musketry were incessant, and often within pistol shot; but the close formation of the French embarrassed their battle, and the British line would not yield them one inch of ground, nor a moment of time to open their ranks. Their fighting was, however, fierce and dangerous. Stewart was twice hurt; Colonel Duckworth, of the forty-eighth, was slain; and the gallant Houghton, who had received many wounds without shrinking, fell, and died in the act of cheering his men. Still the struggle continued with unabated fury. Colonel Inglis, twenty-two other officers, and more than four hundred men, out of five hundred and seventy that had mounted the hill, fell in the fifty-seventh alone; and the other regiments were scarcely better off, not one-third were standing in any. Ammunition failed, and, as the English fire slackened, the enemy established a column in advance upon the right flank; the play of Dickson's artillery checked them a moment; but again the Polish lancers charging, captured six guns. And, in this desperate crisis, Beresford, who had already withdrawn the thirteenth dragoons from the banks of the river, and brought Hamilton's Portuguese into a situation to cover a retrograde movement, wavered; destruction stared him in the face, his personal resources were exhausted, and the unhappy thought of a retreat rose in his agitated mind. Yet no order to that effect was given; and it was urged by some about him, that the day might still be redeemed with the fourth division. While he hesitated, Colonel Hardinge boldly ordered General Cole to advance; and then riding to Colonel Abercrombie, who commanded the remaining brigade of the second division, directed him also to push forward into the fight. The die being thus cast, Beresford acquiesced, and this terrible battle was continued. The fourth division had only two brigades in the field; the one Portuguese, under General Harvey, — the other, commanded by Sir W. Myers, and composed of the seventh and twenty-third British regiments, was called the fusileer brigade. General Cole directed the Portuguese to move between Lumley's dragoons and the hill, where they were immediately charged by some of the French horsemen, but beat them off with great loss: meanwhile he led the fusileers in person up the height. At this time, six guns were in the enemy's possession; the whole of Werlé's reserves were coming forward to reinforce this front column

of the French; and the remnant of Houghton's brigade could no longer maintain its ground: the field was heaped with carcases, the lancers were riding furiously about the captured artillery on the upper part of the hill, and on the lower slopes a Spanish and English regiment, in mutual error, were exchanging volleys: behind all, General Hamilton's Portuguese, in withdrawing from the heights above the bridge, appeared to be in retreat. The conduct of a few brave men soon changed this state of affairs. Colonel Robert Arbuthnot, pushing between the double fire of the mistaken troops, arrested that mischief; while Cole, with the fusileers, flanked by a battalion of the Lusitanian legion under Colonel Hawshawe, mounted the hill, dispersed the lancers, recovered the captured guns, and appeared on the right of Houghton's brigade, exactly as Abercrombie passed it on the left. Such a gallant line, issuing from the midst of the smoke, and rapidly separating itself from the confused and broken multitude, startled the enemy's heavy masses, which were increasing and pressing onwards as to an assured victory: they wavered, hesitated, and then vomiting forth a storm of fire, hastily endeavoured to enlarge their front; while a fearful discharge of grape from all their artillery whistled through the British ranks. Myers was killed; Cole and the three colonels, Ellis, Blakeney, and Hawshawe, fell wounded; and the fusileer battalions, struck by the iron tempest, reeled and staggered like sinking ships. Suddenly and sternly recovering, they closed on their terrible enemies; and then was seen with what a strength and majesty the British soldier fights. In vain did Soult, by voice and gesture, animate his Frenchmen; in vain did the hardest veterans, extricating themselves from the crowded columns, sacrifice their lives to gain time for the mass to open out on such a fair field; in vain did the mass itself bear up, and, fiercely striving, fire indiscriminately upon friends and foes; while the horsemen, hovering on the flank, threatened to charge the advancing line. Nothing could stop that astonishing infantry. No sudden burst of undisciplined valour, no nervous enthusiasm, weakened the stability of their order; their flashing eyes were bent on the dark columns in their front; their measured tread shook the ground; their dreadful volleys swept away the head of every formation; their deafening shouts overpowered the dissonant cries that broke from all parts of the tumultuous crowd, as, foot by foot, and with a horrid carnage, it was driven by the incessant vigour of the attack to the farthest edge of the hill. In vain did the French reserves, joining with the struggling multitude, endeavour to sustain the fight; their efforts only increased the irremediable confusion, and the mighty mass giving way like a loosened cliff, went headlong down the ascent. The rain flowed after in streams discoloured with blood; and fifteen hundred unwounded men, the remnant of six thousand unconquerable British soldiers, stood triumphant on the fatal hill!"

Our task for the present draws to a close; and, after the expression of our cordial thanks to the author for the able execution of his undertaking, we divest ourselves of our characters as critics, and, as Englishmen, express our national pride, our triumphant satisfaction, at finding written proofs, beyond the reach of foreign hatred, or contemporaneous jealousy, that the defence of Portugal, and the discomfiture of her invaders, was not decided by a cast of "fortune's faithless die;" but was solely due to the sagacious designs

and skilful combinations of our general and countryman, Arthur, Duke of Wellington.

Constable's Miscellany, Vol. LXV. Journal of a Residence in Normandy. By J. A. St. John, Esq. 18mo. pp. 296. Edinburgh, 1831, Constable and Co.; London, Hurst, Chance, and Co.

This is a very pleasant little volume, though, we must say, full long for the importance of its contents. A residence in a provincial town, and a few journeys in its environs, afford scant matter for nearly three hundred closely printed pages. But it is a common fault of travellers to imagine that what would never be thought worth mentioning (hardly even in a private letter) if happening in their own country, is deserving of circumstantial detail if occurring in a foreign land. Much in these pages might well have been left out, without loss of either information or amusement; and there are one or two coarse passages, the omission of which would have been an improvement. We now turn to the more agreeable office of praise and quotation. We recommend Mr. St. John's observations on his resident countrymen in France to particular attention.

"It is certain, however, that they who go to reside in France for purposes of economy, very quickly discover that they might have lived much more economically at home. There are very few things cheaper in France than in England, excepting wine and brandy; and, with the aid of these, a man may certainly kill himself for a trifle in that country. House-rents is far from being lower than in towns of equal size in England; and it is considerably higher, if we consider the quality of the house and of the furniture which is put into it when it is called furnished. If persons ever save any thing in France, it is by rigidly denying themselves all those pleasures and comforts which they were accustomed to enjoy in their own country; but this they might do at home, with far less trouble, and a much less painful sacrifice, only removing to a little distance from the scene of their prosperity. Indeed, there are not, I imagine, in the whole world, persons more to be pitied than English economists on the continent. Cut off from all old associations, they become restless, dissatisfied, unhappy. They are seldom sufficiently numerous in any place to allow of each person among them finding society exactly according to his taste; and, whatever they may pretend to the contrary, they never thoroughly enjoy the society of the natives. Reduced to the mere animal gratifications, they eat, drink, sleep, and creep on in discontent and obscurity to their graves. Some of them, it is true, enjoy that sort of excitement which gambling furnishes, and which people without brains mistake for pleasure; but these persons are quickly reduced to a state more wretched than that of the mere eating and drinking emigrants, and generally end by furnishing prematurely a subject to the French demonstrators of anatomy. In proportion to the length of time they have been away from England, their patriotism, or rather their nationality, is strong; for the feeling increases as time softens down the unpleasant and heightens the agreeable features of their own country in their memory. But this only renders them more unhappy in themselves, and more disagreeable to the inhabitants, by constantly impelling them to institute comparisons between England and France, which of course are disadvantageous to the latter. Besides gambling, they have a few other amuse-

ments—scandal, calculation of their expenses, balls, parties, and newspapers. But still their time is badly filled up, and much remains to be devoured by idleness and ennui. Go into the streets whenever you please, you will generally observe two or three knots of Englishmen on the look-out for excitement, inquiring about the king's health, the emancipation of the Jews, or the arrival of the last steam-packet from England. Every new comer is regarded as a godsend for a few days—that is, until he ceases to be new; and then another comes, and amuses and disappoints them in his turn. One excellent regulation has been adopted by the English abroad: a stranger, on his arrival at any place, calls first upon as many of the residents as he desires to be acquainted with, and thus knows just so many persons as he wishes, and no more."

The sounds mentioned in the ensuing passage are new, at least to us:—

"Among the signs of spring in this country, there is one which is any thing but poetical; and that is, the croaking of the frogs, which, in the dusk of the evening, and during the night, is so loud and unintermitting, that it disturbs one's sleep. I never heard any thing resembling it in England. It is almost as loud as the scream of the quail. And every pond, ditch, and river, in the whole country, appears to nourish myriads of these rivals of the nightingale, who seem to rejoice exceedingly in tuning their terrific voices, and 'making night hideous.' With this infernal croaking, which nightly brought Aristophanes into my head, another sound, which I heard for the first time in my life in the neighbourhood of Caen, is frequently mingled. Having occasion to visit the city one night in the early part of the spring, I was startled, on approaching the Falaise road, by a sound resembling the distant tinkling of small bells, breaking suddenly, and in a strange manner, upon the ear. While I was pausing, and endeavouring to conjecture what it might be, a hundred similar sounds seemed to burst up out of the earth, in various places, until all the fields around were alive with this strange music. I was now convinced that it must be the cry of some bird, or reptile, or insect, and was listening to the clear, silvery, fairy tinkling in the distance, when the same sound suddenly burst up in the grass at my feet. I now began to imagine it must be the grasshoppers calling to their mates; but, upon inquiring of the peasants, the only persons who appeared to know any thing of the matter, I was informed that the owners of these fairy bells were the toads. Other persons, however, maintained that it was a species of lizard; others, that it was the frogs; but, upon the whole, the toads seemed to bear the bell."

At Rouen there is a portrait of the celebrated Ninon, of which Mr. St. John observes:—

"A portrait of Ninon, painted by I know not whom, is perfectly exquisite. It was taken when the lady was young and innocent, if she ever was so, for it betrays none of those qualities of mind and heart which have rendered the original so famous. I should have conjectured Ninon to have been a dark beauty, with tresses of jet, and eyes of fire; but she was nothing of all that. On the contrary, she was a delicate blonde, a gentle, modest-looking creature, with blue eyes, and cheeks slightly carnationed. Her only defect was to have had hair too fine and scanty, her tresses being rather apologies for ringlets, than those rich sunny curls which one would have expected to

see on the temples of one so fair and so celebrated."

The following extract does not say much for the common comforts of life:—

"The cutlery, for example, is generally exceedingly poor and clumsy; and every improvement which is attempted is said to be à l'Anglais. They mark their linen with English ink; they cut their beef steaks and plum puddings with English knives, when they can get them; and, if they can scrape off their beards with an English razor, they are but too happy. But, in fact, no man can be expected to be patriotic or national in the matter of razors; for, if the devil himself kept a cutler's shop, and sold a good article, I think no man who has a beard would scruple to become his customer. I was not able to discover a pair of nut-crackers in all Caen, though, I am told, such things have accidentally been seen there; and was compelled to send to London for a pair or two. The instrument with which filberts and hazel nuts are squeezed to pieces here, is exactly like a country cobbler's pincers, only not half so neat. Walnuts are opened with a knife, at the constant risk of lock-jaw. Fenders, of course, there are none; and the fire-irons are of the most rude and awkward construction. The ordinary earthenware is exactly of the description which, I suppose, prevailed before the siege of Troy, being at once ugly and brittle; but the porcelain and finer species of earthenware are frequently extremely tasteful and elegant. The manufacturing of glass seems by no means to have reached the perfection which it has attained among us, though many articles are cheap and pretty. But of all the clumsy fellows in the country, the locksmiths, I think, bear the bell. Nothing can equal the ugliness and coarseness of their locks and keys, if you except the manner in which they are fastened to the doors. In shoeing horses, also, the Normans are peculiarly inexpert. Three persons are invariably employed in the operation: one man seizes the horse by the head, another takes hold of his foot, turns it up, puts on the shoe, and holds it with both hands, while the third strikes in the nails."

The cold in the winter is intense, firing is exceedingly dear, and they have a great prejudice against coal fires.

"Dr. Bennett, the Protestant clergyman, told me, that he had received notice to quit his house, because he burned coal; and another English gentleman at Caen, who had invited a large party, finding his drawing-room very thin, and inquiring the reason, found that the French had staid away because it was understood he burned coal. What renders the preference for wood fires more astonishing is, that, besides giving much less heat than coal, they are far more expensive."

The lace-makers resort to a curious custom to save fuel. "They agree with some farmer, who has several cows in warm winter quarters, to be allowed to carry on their operations in company with the 'milky mothers.' The cows are tethered in a row, on one side of the apartment, and the lace-makers are seated cross-legged upon the ground, on the other, with their feet buried in straw. Opposite each girl, in a small niche in the wall, is a candle, placed behind a clear hemispherical bottle, the flat side of which is towards the candle, and the globular one towards the knitter. This bottle is filled with water, and throws a small stream of strong, pure, white light upon the cushion, which renders the minutest thread of the lace more visible, if possible, than by day. These

cow-houses being generally too dark to allow of their ever working without candles, and the cattle being sometimes out in the fields by day, the lace-makers prefer working all night. Numbers of young men, of their own rank, resort to these cow-houses, and sit or lie down in the straw, by the cushions of their sweet-hearts, and sing, tell stories, or say soft things to them all night, to cheer them in their labours."

French love-making differs very much from our English method. "During courtship, the mother generally sits in the room with the lovers, walks out with them, goes to church with them, and, in one word, never quits her daughter's side until she is fairly married. The other day, in a match where the lover was French, the mistress English, the gentleman, some time after he had obtained permission to pay his addresses, petitioned, with much gravity, to be allowed every day, on entering and quitting the house, to kiss his mistress's cheek. The favour was granted, and the methodical and conscientious lover, never dreaming of overstepping the bounds prescribed, gave his beloved two kisses regularly per day. The courtship was carried on in French, of which the mother did not understand one word, and the daughter very few; but the diplomacy of love requiring but little aid from language, the business was conducted with facility, and terminated as it ought. If the mother, however, left the room for an instant during the courtship, the lover, in the greatest alarm for the honour of his mistress, would start up from the sofa, on which they usually sat, and, throwing open the door of the apartment, that the persons in the next room might have a full view of him, would pace to and fro, or stand as far as possible from the girl, until the duenna returned."

Mr. St. John has, to our taste, one great fault in style—he is too fond of grandiloquent similes applied to ordinary events. The blacksmiths, for example, use "a hammer large enough to have served the Cyclops in beating out the thunderbolts for Jupiter in their smithy in Mount Etna." He encounters some execrable dormitories, sleeping in which calls forth a not very complimentary comparison. "Here, however, having, at all events, a bed apiece, we resolved to repose our 'wearied virtue,' like Milton's devils, after their fall." Passing through the refectory at St. Michael's, now converted into a place of confinement for criminals, is called passing "like Dante and his guide." Two men of low rank quarrel at an inn, and one, "like Byron's Lara, conceives himself insulted." We have reserved the most poetical and polite to the last. "Their 'robes' are only what, I believe, is technically called *half-low* among the ladies. From beneath the neck of this, however, the rich lace of the chemise peeps out, like the leaves of the white rose, full and fragrant, and gives an air of delicate coquetry to the person." We advert to these little absurdities, because they are quite out of keeping with the good sense which marks so many of our author's observations. We regret we have not room for a very interesting scene of drawing for the conscription.

The History and Antiquities of the Doric Race, by C. O. Müller, Prof. Univ. Gött. Translated from the German by H. Tufnell and G. C. Lewis, Esqrs. 2 vols. 8vo. London, 1831. Murray.

THE difficulty, and it is one of reiterated occurrence, that will be found to present itself in the perusal of Müller's *Dorians*, consists in

arriving, with any degree of satisfaction, at the definite conclusion as to what we are to admit and what to reject. We cannot but feel indebted to the weariless spirit of research displayed in collecting materials from the most varied and multiplied sources. We cannot but applaud learning as unbounded in its range as it is indefatigable in the pursuit of all that can illustrate and develop the different bearings of its subject. But while we make these willing acknowledgments, we must urge the necessity of caution, lest, from the extraordinary erudition of the author, the reader suffer himself to be lured on into the wilderness of conjecture and vague speculation. At the same time that no passage of antiquity which bears upon his subject, or can bring out his views in a forcible, or even faint light, escapes the scrutinising intellect of Müller, he cannot be acquitted of an unreasonable tendency to captious incredulity, and a proneness to disputation, where, from the obscurity of the question, any definite result is utterly hopeless. Hence springs up the prevalent habit of rejecting as prejudices the only positions which the relics of ancient literature have handed down. Many incongruities are now apparent, and many inconsistencies startle us, which, had a perfect instead of a mutilated account descended to us, would have been seen to have no existence but in the ignorance arising from the scant and incomplete information that now remains. Thus, the German scholars go far to balance the debt we owe their deep research and acquisitions, by throwing doubt upon points of history, from which we have been wont to derive unmixed delight, but the charm of which is broken the moment we fear them to be no longer facts. From thus having many of our fountains of pleasure destroyed at "one fell swoop," we are the more disposed to cherish the supposition, that these uncompromising historical sceptics are frequently wanderers in the fields of conjecture. We have said so much for the purpose of warning the reader of Müller's *Dorians*, that while he revels in the rich learning of these volumes, however he may be astounded by the prodigious display of investigation, or admire the keen ability evinced in extracting from the depths of classic lore every allusion to his subject, and compacting therefrom a probable, or at least profound, statement; still he will do well to bear in mind, that the grounds upon which Müller proceeds, require the close scrutiny which he himself applies to others; and that his inferences must ever "be weighed in the balance," and when "found wanting," be unscrupulously rejected. We now quote the annexed curious explanation of various terms of relationship, for which we are indebted to the able translators.

"There is, however, a subject connected with the political divisions of the ancient states, on which little or no information is to be found in any English writer; and we have therefore collected from some German books, a knowledge of which is presupposed in the following work, a brief account of the meaning of the terms *φυλή*, *φρατρία*, *πάτρα*, *γένος*, and *αἶμα*. We shall begin by setting down a translation of a passage of Dicaearchus, preserved in Stephanus of Byzantium, which is the chief authority on this difficult subject. '*Patra* was the name of the second stage of relationship among different persons, the first having merely been the affinity between man and wife. Its title was derived from the most ancient and powerful of the race, as, for instance, the *Æacids* or *Pelopids*. The names *Phatria* and *Phratris* arose

as follows. When a man married his daughter to the member of a different *patra*, the bride no longer continued to share in the sacred rites of the *patra* to which she by birth belonged, but was reckoned in the *patra* of her husband. So that a meeting of brothers and sisters in different *patras* having first arisen from natural affection, another society was formed, with a community of sacred rites, called *phratris*. Thus a *patra* arose chiefly from the affinity of parents and children, and children and parents; and a *phratris* from that of brothers and sisters. The terms *φυλή* and *φύλιαι* first arose from the association of mankind into states and nations, each of the combining parts being called a *φύλον*.' The above very curious passage of Dicaearchus, who was a pupil of Aristotle, must be considered in reference to the political theory of that philosopher. The most simple element of civil society is, according to Aristotle, a family: the next, a village, which is a collection or assemblage of families: the last, a state, which is a collection or union of villages. Aristotle, therefore, considers mankind as brought together by the communion of *place*. Dicaearchus, however, supposes the principle of union to have been, not communion of residence, but relationship. In shewing this, he supposes society to be resolved into its most simple element,—a married pair. This is the first stage; and he then proceeds to form a nation, as it were, *synthetically*; that is, he adds the parts together, to make up the whole. The second degree is a *family*, properly so called; that is, a number of persons deriving their descent from the same stock. This was sometimes called *πάτρα*, as being a collection of persons springing from the same father, or *φάτρις*. This person (whether real or supposed) gave his name to all his descendants, such as the *Æacids* from *Æacus*, the *Heraclids* from *Hercules*, &c. which corresponds to our *surnames*. In the origin of society, a family would consist only of parents and children living under the same roof. This is the point at which Dicaearchus must take it; for his third stage is a *collection of families*, which arose, he says, from the regret which the sisters, when married, felt for the loss of their brothers' company; as the wife belonged to the *patra*, or family, of her husband. Hence certain meetings were held, at which all the *patres* connected by marriage took part in the same rites and sacrifices, and thus formed a certain political division, called a *phratris*, from *φρατρία*,—the same as *frater*; because the connexion originated, not, like a *patra*, from *paternal*, but from *fraternal* affection. This great religious festival was, by the Ionians and Athenians, celebrated under the name of *Ἀστυρία*, 'the union of the *πάτρες*, or members of the *φάτριαι*.' A union of these larger bodies, or *phratris*, made a *φυλή*, or tribe (*tribus*), which tribes were again combined into a state."

To enter fully upon the multifarious subjects of which our author treats, is wholly incompatible, both with our purpose and our page: let it be sufficient, therefore, that we afford space for such an extract as will give our readers a fair sample of the translators' style, and Müller's searching manner of handling his subject. We select his remarks on the condition of the Helots.

"It is a matter of much greater difficulty to form a clear notion of the treatment of the Helots, and of their manner of life; for the rhetorical spirit with which later historians have embellished their philanthropic views, joined to our own ignorance, has been productive of much confusion and misconception.

Myron of Priene, in his romance on the Messenian war, drew a dark picture of Sparta, and endeavoured at the end to rouse the feelings of his readers by a description of the fate which the conquered underwent. 'The Helots,' says he, 'perform for the Spartans every ignominious service. They are compelled to wear a cap of dog-skin (*κύνιον*), to bear a covering of sheep's skin (*ἀφίμην*), and are severely beaten every year without having committed any fault, in order that they may never forget that they are slaves. In addition to this, those amongst them who, either by their stature or their beauty, raise themselves above the condition of a slave, are condemned to death, and the masters who do not destroy the most manly of them are liable to punishment.' The partiality and ignorance of this writer is evident from his very first statement. The Helots wore the leathern cap with a broad band; and the covering of sheep's skin, simply because it was the original dress of the natives, which moreover the Arcadians had retained from ancient usage: Laertes, the father of Ulysses, when he assumed the character of a peasant, is also represented as wearing a cap of goat's skin. The truth is, that the ancients made a distinction between town and country costume. Hence, when the tyrants of Sicily wished to accustom the unemployed people, whose numbers they dreaded, to a country life, they forced them to wear the *σαρκίνην*, which had underneath a lining of fur. The Pisistratids also made use of the very same measure. Thus also Theognis describes the countrymen of Megara (whose admission to the rights of citizenship he deplores) as clothed with dressed skins, and dwelling around the town like frightened deer. The *diphthera* of the Helots, therefore, signified nothing more humiliating and degrading than their employment in agricultural labour. Now, since Myron thus manifestly misinterpreted this circumstance, it is very probable that his other objections are founded in error; nor can misrepresentations of this political state, which was unknown to the later Greeks, and particularly to the class of writers, have been uncommon. Plutarch, for example, relates that the Helots were compelled to intoxicate themselves, and perform indecent dances, as a warning to the Spartan youth; but common sense is opposed to so absurd a method of education. Is it possible that the Spartans should have so degraded the men whom they appointed as tutors over their young children? Female Helots also discharged the office of nurse in the royal palaces, and doubtless obtained all the affection with which the attendants of early youth were honoured in ancient times. It is, however, certain that the Doric laws did not bind servants to strict temperance; and hence examples of drunkenness among them might have served as a means of recommending sobriety. It was also an established regulation, that the national songs and dances of Sparta were forbidden to the Helots, who, on the other hand, had some extravagant and lascivious dances peculiar to themselves, which may have given rise to the above report. We must, moreover, also bear in mind, that most of the strangers who visited Sparta, and gave an account of its institutions, seized upon particular cases which they had imperfectly observed, and, without knowing their real nature, described them in the light suggested by their own false prepossessions. But are we not labouring in vain to soften the bad impression of Myron's account, since the fearful word *crypteia* is of itself sufficient to show the unhappy fate of the Helots, and

the cruelty of their masters? By this word is generally understood, a chase of the Helots, annually undertaken at a fixed time by the youth of Sparta, who either assassinated them by night, or massacred them formally in open day, in order to lessen their numbers, and weaken their power. Isocrates speaks of this institution in a very confused manner, and from mere report. Aristotle, however, as well as Heracles of Pontus, attribute it to Lycurgus, and represent it as a war which the Ephors themselves, on entering upon their yearly office, proclaimed against the Helots. Thus it was a regularly legalised massacre, —and the more barbarous, as its periodical arrival could be foreseen by the unhappy victims. And yet were not these Helots, who in many districts lived entirely alone, united by despair for the sake of common protection, and did they not every year kindle a most bloody and determined war throughout the whole of Laconia? Such are the inextricable difficulties in which we are involved by giving credit to the received accounts: the solution of which is, in my opinion, to be found in the speech of Megillus the Spartan, in the Laws of Plato, who is there celebrating the manner of inuring his countrymen to hardships. 'There is also amongst us,' he says, 'what is called the *crypteia* (*κρυπτεία*), the pain of undergoing which is scarcely credible. It consists in going barefoot in storms, in enduring the privations of the camp, performing menial offices without a servant, and wandering night and day through the whole country.' The same is more clearly expressed in another passage, where the philosopher settles, that in his state sixty agronomi or phylarchs should each choose twelve young men from the age of twenty-five to thirty, and send them as guards in succession through the several districts, in order to inspect the fortresses, roads, and public buildings in the country; for which purpose they should have power to make free use of the slaves. During this time they were to live sparingly, to minister to their own wants, and range through the whole country in arms without intermission, both in winter and summer. These persons were to be called *κρυπτεῖαι*, or *ἀγρονομοί*. Can it be supposed that Plato would have here used the name of *crypteia*, if it signified a secret murder of the Helots, or, rather, if there was not an exact agreement in essentials between the institution which he proposed and that in existence at Sparta, although the latter was perhaps one of greater hardship and severity? The youth of Sparta were also sent out under certain officers, partly for the purpose of training them to hardships, partly of inspecting the territory of Sparta, which was of considerable extent, and who kept, we may suppose, a strict watch upon the Helots, who, living by themselves, and entirely separated from their masters, must have been for that reason the more formidable to Sparta. We must allow that oppression and severity were not sufficiently provided against, only the aim of the custom was wholly different; though perhaps it is reckoned by Thucydides among those institutions, which, as he says, were established for the purpose of keeping a watch over the Helots. It is hardly necessary to remark, that this established institution of the *crypteia* was in no way connected with those measures to which Sparta thought herself compelled in hazardous circumstances to resort. Thucydides leaves us to guess the fate of the 2000 Helots, who, after having been destined for the field, suddenly disappeared. It was the curse of this bondage (which Plato terms the hardest in

Greece), that the slaves abandoned their masters when they stood in greatest need of their assistance; and hence the Spartans were even compelled to stipulate in treaties for aid against their own subjects."

This topic naturally awakens the recollection of the reader, and directs it to the extraordinary delusion that prevails in the world relative to the vaunted *liberty* of Greece. At Sparta the slaves were upwards of two hundred thousand; at Athens, something under that number: the proportion of citizens in the former state was eight thousand; in the latter, twenty; and thus, throughout the rest of Greece, was the infinite majority doomed to slavery. Provided in that "land of the free" the democracy at Athens, the oligarchy at Sparta, or whatever favourite form of government suited their several tastes, was the dominant power, a hue and cry was raised about freedom, the echoes of which would still have the world suppose that such a thing had a positive existence. Now, if the great bulk of mankind is to be taken into account, this liberty was assuredly romance, rather than reality. In closing our notice of these volumes, we have only to express our acknowledgments to the industry, and add our testimony to the creditable manner in which the translators have executed their useful and laborious undertaking, and mention that the work carries with it the recommendation of some invaluable maps.

Thackrah on the Effects of Arts, Trades, and Professions, and on Health and Life.

[Second Notice: conclusion.]

IN this age of strange and contradictory opinions, when it is no easy matter to decide, whether it is better or worse for a community that a majority of its members should be cut off in the flower of their years, or be suffered to enjoy a healthy longevity, and people the country; at a period when, in theory at least, all the anxious measures of former legislators, and all the ideas of our forefathers, that it was good to replenish the earth, and that the strength of a nation lay in the abundance of its population, seem to be regarded as barbarous paradoxes; at such a time, we say, it is difficult to tell whether we ought, humanely speaking, to laugh or weep at the distressing *ensemble* of Mr. Thackrah's picture. Sure we are, that our progenitors would have thought it most calamitous, and would have set to work, with all their strength and ingenuity, to devise means of improvement: but we are almost equally sure that our contemporary philosophers will hail it as a blessing, that so many occupations contribute to the abridgment of human life. Were it not for these, for habits of intemperance, for labour continued beyond the physical endurance of man, for insufficient nourishment, for exposure to cold and misery, for the rack of nerves, and the thousand other ills which, in our complicated state of civilisation, more than 95 per cent of us are heir to, the land would soon be so overrun, that we must resort to infanticide, cannibalism, or some other horrible process, in order to thin and remedy the superabundance. War and pestilence would come to be hailed as boons; the individual who imported plague or cholera morbus would be entitled to a statue or a temple. Yet it is a curious contradiction in our system, that, while we praise the devisers of every scheme for reducing the population, such as discouraging early marriages, and encouraging emigration, we at the same time praise the skilful accoucheur, surgeon, and physician, the patriarchal-looking papes and

mammæ with prodigious tails of good-looking progeny, and all others who contribute to increase our wretchedness, by bringing into, and keeping in, the world that very superfluous which occasions us so to jostle and pinch each other for food and raiment. Truly we are in a dilemma; but still we must confess, for ourselves, that our hearts bleed when we read of so vast a multitude of our fellow-creatures perishing from disease, and doomed to close a life, only long in weary sufferings, in the quiet of an early grave. Surely Nature never intended this; surely it is counter to the scheme of a beneficent Providence. It is dreadful to reflect upon; and every being, not utterly lost in heartless selfishness, ought to exert his uttermost power to lighten the heavy load. We are not fond of theories; but the theorist upon this subject claims our respect, when we see that his motives are benevolent; and, if we could but witness the practical also, each in his own sphere, the landlord, the master-manufacturer, the merchant, the clergyman, bend his energies to promote the welfare of those immediately around him, we fancy that a mighty sum might readily be added to the aggregate of human happiness.

It is a disordered state of society, where any considerable proportion cannot obtain food by their toil; and discontent and the desire of change are the rational results. Before the necessity of remedying this state of things, even the great question of Reform becomes a mere trifle. They ask for bread, and you give them a problem,—a problem, however, which we grant is of essential consequence to the body politic.

With these preliminary remarks, we resume our analysis of Mr. Thackrah's volume, and come to his second division, i. e. of *dealers*.

Shopkeepers suffer from want of air and exercise. They are "pale, dyspeptic, and subject to affections of the head. They drag on a sickly existence, die before the proper end of human life, and leave a progeny like themselves."

Commercial travellers are compelled to take more liquor daily than nature requires; and the consequence is, in spite of their active employments, that few of them bear the wear and tear for thirty years—the majority not twenty. For the drinker, if he "be not suddenly taken off by apoplexy, or other affection of the brain, he merges into droopy, and the bloated mass sinks into an early grave."

The third division of the work before us refers to *merchants and master-manufacturers*. These are affected by the general principles applicable to other classes. If not too much confined, or exposed to injurious dusts, or effluvia from manufactures, or so hurried as to swallow their meals in a hasty manner, their lives are of a fair proportion. But, truly, adds the author, "of all agents of disease and decay, the most important is *anxiety of mind*. When we walk the streets of large commercial towns, we must be struck with the hurried gait and care-worn features of the well-dressed passengers. Some young men, indeed, we may remark, with countenances possessing natural cheerfulness and colour, but these appearances rarely survive the age of manhood."

The physical evils of commercial life would be considerably reduced, if men reflected, that the success of business may be prevented by the

very means used to promote it. Excessive application and anxiety, by disordering the animal economy, weaken the mental powers. Our opinions are affected by states of the body, and our judgment often perverted. If a clear head be required in commercial transactions, a healthy state of the body is of the first importance; and a healthy state of body is incompatible with excessive application of mind,—the want of exercise and of fresh air. But subjects like this find no entry in the books of our merchants. Intent on their avocations, they strangely overlook the means necessary for pursuing them with success. They find, too late, that they have sacrificed the body to the mind."

Mr. Thackrah allows for the pleasures of the table; but goes into details, enough to frighten the most resolute *bons vivants*, who exceed, and make a god of their belly. The worshippers of *center Deus*, who build houses as if they were immortal, and feast as if they meant to live for only a very short time, are denounced as the sure consumers of the latter purpose. But we need not insist on the evils which attend those who will indulge their appetites: all that we can do, is to suggest the use of an improvement of our own day for their benefit—we allude to the stomach pump! The Romans, we know, had some not very delicate modes of prolonging and repeating gastronomic enjoyments; had they been enlightened with the knowledge of this machine, how happy it must have made them!

But, leaving both Roman and English epicures, we approach the fourth, the last, and not the least interesting of Mr. Thackrah's divisions; *professional men, and persons engaged in literature*: those who work by mind more than by body. "Some have mental application conjoined or alternating, with considerable exercise in the open air.

"*Civil engineers, surveyors, and architects*, belong to this division. Though confined to the desk occasionally, yet they travel frequently through the country, and thus enjoy fresh air and muscular exertion. They are, indeed, occasionally exposed to wet and cold; but these agents seldom injure persons in motion. Few individuals in this department are unhealthy; except those who are irregular in their habits, and addicted to high living.

"*Ministers of religion* have a similar alternation of study and exercise. The latter, however, is too gentle or restricted for muscular men. Their situation, and the ideas attached to it, unfortunately prevent their joining in sports or amusements which produce a full circulation of the blood, and a full action of the viscera. Hence, congestion of the venous system of the bowels is a frequent occurrence. The individuals of this class who are hard students may be referred to the section of literary men. Clergymen, who preach long, frequently, or with vehemence, as well as orators, actors, public singers, and persons who play much on wind instruments, are subject to pains in the chest, spitting of blood, and diseases of the larynx.

Practitioners of medicine and surgery.—"Night calls (observes Mr. T.) are generally thought to be very injurious. I think the evil less than the public and the profession suppose; for, if we observe those who have for thirty or forty years been much engaged as accoucheurs, we shall find them as robust as others. Anxiety of mind does more, I conceive, to impair health, than breach of sleep, nocturnal exposure, or irregularity in meals." As a profession, the medical is by no means

healthy;* and there is an extraordinary mortality among the students.

"We have next to refer to persons who have much mental application, without adequate exercise of the body.

"*Clerks, book-keepers, accountants, &c.* suffer from confined atmosphere and a fixed position.

"Though urgent disease is not generally produced, yet a continuance of the employment in its full extent, never fails to impair the constitution, and render the individual sickly for life.

"*Schools* (the author continues) demand our particular attention. Children are crowded in rooms of disproportionate size. The air, consequently, is greatly contaminated, and the vital power is more or less reduced. Even where attention is paid to ventilation, the evil must, in a greater or less degree, exist in large schools. I mention, as an instance, that excellent institution, the Leeds Lancasterian school. Children, and very young children, are kept, too, for many hours daily, in a state as nearly motionless, as it is possible for the masters to produce. The time devoted to amusement is much too little. Instead of two or three hours a-day being allowed for play, only two or three hours a-day should be devoted to confinement and labour. To fix a child in a particular posture for hours, is vile tyranny, and a cruel restraint on nature. The practice in infant schools is admirable; for here the muscles and the mind are suitably and alternately exerted. The diet at boarding-schools is often much too scanty. The meals are neither as numerous nor as plentiful, as the growth and nourishment of the body require. Neither is the diet sufficiently animal. The exertion of mind also greatly, though indirectly, impairs the corporeal vigour. Learning, or what is called learning, absorbs the nervous energy which is necessary for the body. School-boys have, in winter, too little fire, or are kept too far from it. Hence they suffer a general depression, and are often affected with chilblains. The inmates of schools, though not often attacked with urgent disease, are rendered delicate. Scrophulous complaints are developed, and the vigour of the constitution remains frequently impaired for life. Young ladies especially suffer from habits of schools. Their exercise is much too limited. They walk out, it is true, but scarcely at a rate sufficient to warm the feet. Their time for amusement is too little; and full romping exercise, exercise which brings all the muscles into play, is discouraged." The principal cause of the ill health of girls is the want of full exercise, whether at schools or after they have returned to their homes. Tight stays are also of the most fatal tendency, injuring the spine, and diminishing the capacity of the chest.

"*The profession of the law*, in most of its branches, is sedentary. Solicitors' and other clerks are kept, from morning to night, in a bad position, with the limbs fixed, and the trunk bent forward."

But, leaving the lawyers to take care of themselves, which they very well know how to do in this world, we "have now arrived at the last class of society,—persons who live in a bad atmosphere, maintain one position most of the day, take little exercise, and are frequently under the excitement of ambition. This class

* "Ramazzini speaks very differently on the subject. He says that medical practitioners are comparatively exempt from ordinary diseases, in consequence of the good exercise, and their hilarity of mind, when they come with their fees in their pockets.—*Dura bene vult mori lætus rursus repetit.*" He adds, that medical men never so unwell, as when no one else is unwell."

* "Thus," says the author, "an occupation in itself so healthy, that a man might follow it from boyhood to eighty, in health and vigour, is corrupted to the production of disease, and the destruction of at least half the term of human existence."

includes individuals from the several professions, as well as the men devoted to science and literature."

And on this subject we cannot but quote the first observation feelingly:—

"The position of the student is obviously bad. Leaning forward, he keeps most of the muscles wholly inactive, breathes imperfectly, and often irregularly, and takes a full inspiration only when he sighs!!"

Our poor friends and fellow-labourers, is not this too true? Unhappy race! whose best breath is a sigh; whose inspiration is almost a groan; and whose expiration is but a brief term! We will not detail the particulars of your unhappiness, your enfeebled circulation, your cold feet, your reduced powers of digestion (when you have any thing to eat), your impaired nervous energies, your disturbed brains, your irregular arterial action, your epilepsies, your insanities, your diseases of liver, lungs, and heart (*quæque ipse miserrima vidi*). We will only finish, as we cannot help ourselves, with "a full inspiration,"

ALAS! A SIGH!!!

Legends and Stories of Ireland. By Samuel Lover, K. H. A. With six Etchings by the Author. Pp. 227. Dublin, 1831, Wake-man; London, Baldwin and Cradock; Edinburgh, Oliver and Boyd.

We very much doubt whether "excess of appetite doth" in this way "grow by what it feeds on." Irish tales and legends have been both so very good and so very plentiful, that, to use a Dublin Bay simile, "there's a glut of herrings in the market." Many of the stories are very humorously told, though somewhat lengthy. The "illegant" addition to Brian O'Lynn's "ginteele clothin'" is very droll.

"Brian O'Lynn had no watch to put on,
So he scooped out a turnip to make him a one;
He next put a cricket bone under the skin,
Who! they'll think it is tickin'! says Brian O'Lynn."

The etchings are extremely clever and characteristic.

The Works of Lord Byron. Vols. V. and VI. London, 1831. J. Murray.

THESE two neat and singularly low-priced volumes complete the edition of Lord Byron's works, containing all the scattered poems, never before collected. We must confess most of his epigrams are much indebted to his name. Still this collection is of great interest:—from the *Mourning of Idleness* upwards, we may mark the progress of his mind, and in every slight poem some phase of his thoughts and feelings. We must own to preferring his graver mood—more than half of his mirth was ill nature;—but that is mirth's usual infirmity.

Constable's Miscellany, Vol. LXIV. The Achievements of the Knights of Malta. Vol. II. By Alexander Sutherland, Esq. Author of "Tales of a Pilgrim." London, 1831. Hurst, Chance, and Co.; Edinburgh, Constable and Co.

WE have only to repeat for this volume the recommendation we gave its predecessor;—praise for industry, clearness, and an animated tone, which enters into the chivalric spirit of the order whose annals it records.

Songs of the People; or, British Melodies. By T. H. Cornish. Pp. 132. London, 1831. Smith, Elder, and Co.

THESE must be some particular charm in publishing a volume of poems—there ought to

be. We extract a single verse from this little volume for the sake of one of the oddest opinions that were ever pronounced on Crabbe's poems.

"I was not born to fame—not I;
I was not born to fame:
I have not Hood's keen pleasure;
I have not Campbell's claim.
Friend Crabbe was never crabbed seen,
I like his cheerful twinkle;
Though I have never Moorish been
I love the name of Little."

Certainly, "Sir Eustace Grey," the dark and powerful painting of the "Borough," was never called "cheerful twinkle" before. It is something for an author to be original.

Lardner's Cabinet Cyclopædia; Vol. XVI. Geography. London. Longman and Co.

THIS volume is the third and last devoted to the interesting history of Maritime and Inland Discovery. Of later date than the first volume, it could not be expected to contain so much of matter which was not only racy, but new from its antiquity. The first chapter, however, is an equally able and agreeable sketch of the progress of geographical science in the middle ages. The rest is a pleasing *coup d'œil* of the voyages of Byron, Wallis, Carteret, Cook, La Pérouse, D'Entrecasteaux, Dillon, Bounty Bligh, Flinders, Baudin, King, Ross, Parry, Franklin, Humboldt, Park, Denham, Clapperton, and other celebrated navigators and travellers. Such a volume must be read with great pleasure, and afford much various information; but we have in our *Gazette* journeyed with so many of the originals, that we need not encumber this encomium with quotations.

The Historical Traveller, comprising Narratives connected with the most curious Epochs of European History, and with the Phenomena of European Countries. By Mrs. Charles Gore. 2 vols. 18mo. Colburn and Bentley.

A SELECTION of interesting episodes belonging to history, and addressed to the rising generation, this is altogether a very charming book for youth. Most of the stories are full of attraction, such of those of Masaniello, Ugolino, Cola di Rienzi, the impostor Demetrius, Hofer, &c. &c.; but besides these, there are a multitude of chapters devoted to information of all ages, kinds, and countries, which is supplied in a way well calculated to amuse while it instructs.

The Planet. No. II. for March. Nimmo.

WE are again induced to notice our modest monthly contemporary, for some interesting reminiscences of Gilbert Stuart, Burns, and John Logan. They are simple and unadorned touches, and must be gratifying to all the admirers of genius—especially to our brethren in the north. The other parts of this little publication display throughout good feelings—the greatest recommendation of any periodical.

Dr. Lardner's Cabinet Library; Vol. III. Annual Retrospect of Public Affairs for 1830. Longman and Co.

ONE of two volumes to record the principal events of the past year, according to the best views which the writer could take of them from so near a distance. It seems to be what is called ultra-liberal in its tone; and the remarks on the character of George IV. appear to us, for instance, to be unnecessarily, and, we think, unjustly harsh. We allude, particularly, to the publicly refuted charge of his hav-

ing neglected Sheridan during his latter days, which is here stated as a fact.

Dibdin's Sunday Library, Vol. II.

Longman and Co.

LIKE its predecessor, a good selection from admired and sterling writers. A valuable contribution to the religious world.

Waverley Novels; Vol. XXII. Kenilworth. Edinburgh, R. Cadell; London, Whittaker and Co.

AMONG Sir Walter Scott's own "Family Library," few works have been more popular than *Kenilworth*—the first volume of which is now before us. There is nothing in the preface or notes of sufficient originality or interest for quotation. In one of the notes it mentions, that Surrey used to call Leicester the Gipsy, on account of his dark complexion. Now, the portrait at Penshurst certainly represents him with red hair. We submit this discrepancy to the antiquaries.

The National Library—Standard Novels, No. 1.; the Pilot, by J. F. Cooper, complete in one volume. 12mo. pp. 420. London, 1831. Colburn and Bentley.

A VERY neat and very cheap volume; giving the ornaments of excellent printing, a pretty picture, and a good-looking outside, to that branch of our literature which, being generally called light and amusing, seems especially to require the aid of external embellishment. To this we must add, that a good selection of modern fictions will embody at least the majority of the thought and talent of the present day. The *Pilot* is too well established in public favour to require criticism; we certainly consider it the best of Mr. Cooper's works.

ORIGINAL CORRESPONDENCE.

ROYAL SOCIETY.

To the Editor of the *Literary Gazette*.

SIR,—A pamphlet, professing to be a "Statement of Circumstances connected with the late Election for the Presidency of the Royal Society," has just reached me; and as, in reference to that which has appeared in your publication on this subject, it is insinuated, that your information has been derived from me, and that the effect of this has been to induce Mr. Davies Gilbert to resign the chair of the Royal Society, I have to request of you to disavow for me, in the most positive and unqualified manner, the having contributed to you, either orally or by writing, directly or indirectly, any information at all connected with the subject. After the assertion contained in my letter of the 25th of October, to the editor of the *Times*, to which I subscribed my name, because, as I there state, I had never, "either directly or indirectly, written or given sanction to any of the various anonymous paragraphs that have appeared upon this subject in the periodicals of the day," and which letter is reprinted in this pamphlet, I surely could not expect that it would have been necessary for me to have troubled you respecting it. As, however, it relates to a point of character, I am, of course, anxious on the subject; and I shall feel obliged by your attention to it in your ensuing number. The pamphlet itself neither needs nor merits a reply. I am, sir, your obedient servant, T. J. PETTIGREW.

Swilite Row, March 2, 1831.

ARTS AND SCIENCES.

ROYAL INSTITUTION.

MR. COWPER on the recent improvements in paper-making. These observations were intended as an appendix to a lecture on the same subject, delivered by Mr. Millington in this Institution two or three years ago. Mr. Cowper described the mode of making paper by the machines of Hard and Fourdrinier, for the sake of those of his auditors who were not present at the former lecture. Next, the beautiful machine invented by Mr. Dickenson was illustrated by drawings and experiments. This machine differs considerably from Fourdrinier's: in the latter, the pulp flows upon a horizontal web of wire, about 30 feet in length, stretched on rollers, upon which it revolves; the water from the pulp flows through the web, and leaves the paper on its surface; and as the water drains from the pulp merely by its own weight, it requires about 11 feet in length of wire-web, moving at the rate of 22 feet per minute, or, in other words, half-minute time, to allow the pulp to become sufficiently set before it can be taken off the wire. In Mr. Dickenson's machine, a perforated brass cylinder, about 20 inches in diameter, covered with wire-web, and nearly immersed in the pulp, is substituted for the endless web in Fourdrinier's. The idea is very ingenious. The cylinder is turned truly inside and out,—it is perforated all over by holes and grooves, so disposed, that, when covered first with a layer of plain wires, and afterwards with the wire-web, there is no part of the wire-web which does not communicate with the interior of the cylinder. The ends of this are closed, and it revolves on a hollow spindle or pipe, which has two or three small branch-pipes, bent downward within, but not touching the cylinder: these pipes, from their action, may be called siphons. An air-pipe enters the hollow spindle at one side of the cylinder, and is bent towards the interior upper surface, where it is united to a sort of trough, the edges of which apply themselves closely to the interior, by means of packing; i. e. the interposition of any elastic substance. A vacuum is constantly produced in this trough by the air-pump: the trough extends about 8 or 10 inches along the circumference of the cylinder, all of which part is above the surface of the pulp, in which the rest of the cylinder is immersed. As the cylinder revolves, the water flows through the wire-web into the interior, whence it issues by the siphons through the hollow spindle. The current of water flowing through the wire draws the floating fibres against the cylinder, and the paper continues forming, till, in the course of its revolution, it rises over the vacuum-trough. Here the pressure of the atmosphere comes into action, and the remaining water is instantly forced through the wire-web, and the sheet taken up by a blanketed roller. The paper is thus made in the space of a few inches, the machine moving at the rate of 48 feet per minute. Mr. Cowper exhibited a working model of the machine invented by him for preventing the loss, by what, we believe, is technically called shavings; a loss varying from one-sixth to one-twelfth of the whole paper manufactured. The model was furnished with a reel of tissue paper, about 200 feet long: the longitudinal cutting is effected by circular knives, and the transverse cutting by a serrated knife, which divides the paper easily, accurately, and with a sufficiently small edge. A drawing was also exhibited, to illustrate Mr. Ibbotson's new strainer for prevent-

ing the knobs which are sometimes found in paper. Mr. Cowper concluded by noticing the gratifying results of the improvement in paper-making and printing-machines; observing that the Bible Society expended between 50,000*l.* and 60,000*l.* annually on paper and printing; the Tract Society also, he stated, frequently printed upwards of 400,000 of a single tract; other Societies for the diffusion of knowledge, whose names he mentioned, printed of each number of a series as many as 20,000; and of the new edition of Sir Walter Scott's *Tales* about 1000 volumes were printed in a day.

A very fine series of anatomical models and drawings were placed in the library; also working models of Mr. Price's method of warming houses by hot water, the principles of which he explained to the members and visitors.

ROYAL GEOGRAPHICAL SOCIETY.

FEB. 28th. Colonel Leake, V.P., in the chair. —Read minutes of the preceding meeting, and list of donations since made to the Society's library. Several members balloted for, and candidates proposed. We are happy to have it in our power to develop the ulterior objects of this excellent institution, by inserting here the purposes announced by its directors.

"The president and council of the Royal Geographical Society of London give notice, that his majesty's annual donation of fifty guineas, as due for this year, will be presented to the author of the best communication of either of the two following descriptions, which may be sent to the Society on or before the second Monday of March 1832; provided that it appear to the council worthy of such distinction, viz.:

1. "A detailed account, accompanied by sufficient plans and views, of any important geographical discovery not previously published, and in which the author shall have been personally engaged.

2. "The establishment of any of those lost sites of antiquity which are materially connected with the geography of history, and which may thus rank with modern discoveries of equal value.

"Further; next year's premium will be bestowed on the best communication of the following kinds (also if considered worthy of it), which may be sent before the second Monday of March 1833, viz.:

1. "A manual for the assistance of travellers; enumerating concisely, but clearly, the objects to which the attention of a geographical inquirer should be especially directed, and indicating the means by which the information he requires may be most readily obtained. It should describe the instruments by which positions are determined, elevations and distances measured, magnetic phenomena observed, and peculiarities of temperature, atmosphere, and climate, compared; giving directions, also, for adjusting the instruments, formulae for registering the observation, and rules for working out the results. It should also indicate some of those minute observations regarding the division of trades and occupations, the prevalence of marriages, and other data, from which valuable statistical inferences may frequently be drawn, where exact information is unattainable. And, to render it more generally useful, it should further consider, that there are various classes of travellers; and that, for the use of pedestrians, who may be obliged to carry, and often to conceal, their implements, the lightest and most portable, consistent with minute accuracy, should be devised and suggested.

2. "A statement of the principal desiderata in local geography, ancient and modern; bringing into one view what has been already done, and pointing out the most eligible routes that travellers can now pursue, in endeavouring to extend the range of minute and exact geographical knowledge.

3. "Copious tables, shewing the changes which have occurred in the nomenclature of places at successive periods of history, and giving references to the authorities.

"The president and council further announce, that it will always be a favourite object with them to encourage, by premiums or other rewards, mechanical inventions which may facilitate the acquisition of geographical knowledge, or render it more available to the public. Under these heads may be included the simplification of instruments and mathematical formulæ applicable to geographical purposes;—more compendious methods, consequently, of determining positions, heights, or other interesting local peculiarities;—and all improvements in the art of drawing or engraving maps, by which their precision and distinctness may be increased, and greater scope and expression given to what may be called the language of topography."

In conclusion, was read part of a paper on the isthmus of Panama, and the best means of effecting an easy mercantile communication between the Atlantic and Pacific Oceans, across it; communicated by J. A. Lloyd, Esq., who surveyed the country with this view, in 1827. This was filled with topographical details of great interest, and for the most part previously unknown; but we reserve our analysis of it till concluded.*

LINNEAN SOCIETY.

DR. MATON in the chair. A paper by D. J. Lindsay, Esq., on a new species of land shell, *Helix obvoluta*, of Lamarck, was read. It appeared that this species was found among moss about the roots of trees, at Ditcham Wood, near Buriton, Hants, along with *Helix nitida* and *rufescens*; so that the species is decidedly a native, though heretofore it has not been so classed. The commencement of another paper, entitled, "On the Nautilaceous Mollusca of Great Britain," by J. G. Jeffreys, Esq., was also read.

HORTICULTURAL SOCIETY.

DR. HENDERSON in the chair. A communication on the culture of the melon, by Mr. Knight, the president of the Society, was read. Mr. Knight strongly recommends that the Persian melon, especially, should be allowed to grow in a hanging position, as it is thereby less liable to burst than when allowed to rest on the ground, as is generally the mode in which the melon is cultivated. Several beautiful specimens of the *Camellia Japonica*, from the Society's garden, were exhibited.

ECLECTIC SOCIETY.

MR. J. FROST in the chair. After the routine business, Dr. James Rawlins Johnson read his paper on the *Planaria torva*. The learned doctor stated that his attention had been called

* The noble president, Lord Goderich, on being informed that in some other societies (the Royal, the Society of Antiquaries, &c.) refreshments were given at their meetings, has, in the most liberal manner, expressed his desire to pay the same attention to the members of the Geographical. Nothing pleases us more than to see ministers of the crown placing themselves in communion with those who cultivate the fine arts, the sciences, and the literature of the country: it is the noblest sort of popularity! We rejoice, therefore, to add, that the same noble Lord was on Wednesday elected a member of the Royal Society of Literature.—*Ed. L. G.*

to these singular animals by observing parts wanting in some, and in others such variety of appearance as might have justified an inattentive observer in supposing that they were of different species. The planariae are found near the Red House, Battersea, and are of a dirty brown or black colour; they vary in length from a third to half an inch, and have some resemblance to a leech. They have two eyes, placed like the eyes of a sole; they have two abdominal apertures; one, by which they feed, is situated about the place of the umbilicus in land animals, or even lower, which is very extraordinary; the other is the anal opening, situated at a little distance below the former. They feed by means of a trumpet-shaped proboscis, which is protruded, and bears a strong resemblance to the trunk of an elephant. Dr. J. having first vindicated himself from the charge of cruelty, by shewing that animals so very low in the scale of beings are almost, if not quite, exempt from the sense of pain, proceeded to state the results of his experiments. He cut off the head of a full-sized planaria below the eyes; a new head was reproduced in a few days, varying from nine to fourteen. He cut off this second head; a new one was again regenerated: a third, fourth, fifth, and sixth experiment met with the same success; and the doctor is of opinion, that if the cold weather (which is unfavourable to these creatures) had not set in, any number of heads might have been produced from the same body. In one of these experiments a new head was formed with but one eye, and that in the centre. He next made a longitudinal incision in another planaria between the eyes, and an incision at right angles with it; thus cutting off half the head, together with one of the eyes: in about fourteen days the piece was reproduced with a new eye, in the most perfect symmetry. The doctor divided another planaria into three equal portions transversely; the head speedily acquired a new body and tail, the tail reproduced a new body and head, and the middle piece regained a new head and tail. He divided many other planariae into six and even eight parts; each portion retained its vitality, and set about reproducing as much of a new body as was required to restore it to the form of the perfect animal, of which it formed once a component part. The doctor dissected wedge-shaped pieces out of the heads of other planariae, which were speedily reproduced, and what is most curious occurred,—that, according to the depth and breadth of these wedge-shaped incisions, a new eye would be supplied, making three eyes; or two new eyes, making four eyes; or if the incisions were very deep, then, instead of a new piece being supplied, the parts would diverge, and form two perfect heads. The limits of this report preclude many important and curious matters relating to this wonderful little animal. The doctor concluded by stating, that it is his intention to renew his inquiries in the approaching season; and that he had reason for believing he should be able to discover other circumstances in the history of the planaria not less interesting than the foregoing. On the table were two living double-headed planariae. The meeting adjourned until the last Tuesday in March, which is the anniversary of the Society.

ZOOLOGICAL SOCIETY.

J. E. BICHENO, Esq. in the chair. The monthly report was read. 3160 persons had visited the gardens, and 816 the museum, during the month of February; and the balance in favour of the Society on the month's ac-

count was stated to be 645*l*. Several interesting donations were announced: the Duke of Sussex had presented a beautiful Persian lynx. Professor Sedgwick, Sir Gore Ouseley, Lord Francis Russell, and several ladies, were elected into the Society. In consequence of the resignation of the president, a motion, which requested Lord Stanley, the president of the Linnean Society, to act in his stead until the anniversary, was agreed to. The new by-laws, about which so much has been said at recent sittings, were submitted to the meeting, as approved by the council, and ordered to be suspended in the meeting-room during the next three months. It may be mentioned, that the female Surikati (*Suricata Capensis*), a curious little animal, nearly allied to the ichneumon, died about a month ago: the male has taken his loss so much to heart, that he scarcely lifts up his head, but continues pining, and was considered at the sitting of this meeting to be in a hopeless state.

NEW DYE.

WE live in an age of improvements. Last week our *Gazette* contained the first public intimation and account of a discovery, which promises every man his dram with his bit of bread; since the loaf, in its baking, is found to give out a vapour which needs only to be collected to furnish an excellent spirit. Now, therefore, ovens may also be considered as stills, and the staff of life will be the more required to support those whose heads it may tend to turn by its odorous products. But our present purpose is with a new method of dyeing with Prussian blue; which is stated to be so efficient and cheap, as entirely to supersede the necessity for indigo. The prospectus issued by the inventors of this commercially important composition is now before us. It states, that since the year 1752, the attention of the most able chemists of Europe has been directed to the discovery of some means by which a fast blue dye might be obtained without the use of indigo; but that hitherto their researches have been attended with no favourable results, inasmuch as the use of Prussian blue (the only substitute that could be used) has been found to render the wool too hard to work well, and at the same time to burn it. But the inventors, who, we believe, have secured their discovery by a patent, assure us that their experiments have succeeded, and that they are prepared to submit to the public, specimens of blues, which have been produced without indigo; the tints of which are equal, if not superior, to any colour that has yet been produced by that dye, and its durability incomparably superior. Specimens, they add, will be produced of clothes that have been worn until there literally remained but the thread, and yet the colours are as firm as when first the cloth was cut, nor is there the slightest appearance of white upon any of the seams; a fastness of dye which has never been produced by indigo. We ought to mention that these specimens have been exhibited to us, and that they fully bear out the description given. Among the advantages which the proprietors promise from the adoption of this dye, are the following:—All the substances which compose it are indigenous to all countries, are abundant and cheap, not only in consequence of their great plenty, but also from many of them being absolute refuse, such as old woollen rags, meat unfit for use, blood, entrails, and, in fact, every description of animal matter, however corrupt may be its state:—as a new branch of industry, the manufacture would be a national benefit:—a much greater

solidity, beauty, and brilliancy of colour, than hitherto attained, and a capability of being brought to any tint required:—in an apparatus of equal capacity, three times more wool can be dyed by this process in a given time, and at an infinitely less cost than can be dyed by indigo:—wool dyed by the new process is in every respect better to work, is softer, cards better, and is more pleasant and easy to weave than when dyed with indigo:—it is not only applicable to blues, but is equally efficient as the foundation for blacks and greens; those colours being produced of the most beautiful tints:—for hats, the beauty and intensity of the black it produces, and the rapidity with which the operation of dyeing is performed, renders the discovery invaluable to that branch of trade. Such are the advantages proposed by the adoption of this process; and assuredly a discovery which would lower the price of articles of universal consumption and in constant use, and open a home employment of great extent, in the room of foreign and imported produce, is well worthy of the consideration of a commercial people. We can only speak of the thing from what we have seen, and the old and new cloths shewn to us seemed completely to warrant the pretensions which accompanied them. We have no doubt but that both practical skill and large capital will soon put this novelty to the test; and were it ours, we should not be afraid to “stand the hazard of the dye.”

LITERARY AND LEARNED.

ROYAL SOCIETY.

THE Duke of Sussex in the chair.—The reading of Mr. Lloyd's paper on the level of the Thames was resumed and concluded. Several scientific works were presented. After the meeting, Mr. Robinson exhibited in the library his new mountain-barometer, and explained its peculiarities. This instrument excited much interest amongst the members. The mercurial column is divisible into two portions, for safer and more convenient transport; the barometer itself, and the stand, may be enclosed in a case a foot and a half long, and three or four inches deep. Mr. Davies Gilbert has appointed Professor Whewell, Dr. Chalmers, Dr. Kidd, Dr. Buckland, Dr. Roget, Mr. Charles Bell, the Rev. W. Kirby, and Dr. Prout, to write the work for which 8,000*l*. was left by the will of the late Earl of Bridgewater; the president of the Royal Society for the time, being the sole disposer of the money, and having the appointment of the authors, without any control; and being empowered to advance the sums of 300*l*. and 500*l*. during the progress of the work. In forming the above selection of authors, Mr. Gilbert was guided by the advice and opinion of the Archbishop of Canterbury and the Bishop of London.

The following is an epitome of Dr. Lardner's paper on the lunar theory, read at a recent meeting:—

The subject treated of in this paper is introduced by a review of the labours of Clairaut, Euler, D'Alembert, and Thomas Simpson. The theories of these eminent men, the author remarks, were very deficient in accuracy, and were not at all adequate, without correction from observation, to the construction of tables. They could serve only to point out the arguments of the equations, and not all even of those. The inequalities of the moon's motion are investigated by approximating processes, which lead to results more or less accurate, according as the approximations are car-

ried to a greater or less extent. The writers above mentioned had contented themselves with short and easy approximations; and, though they had accomplished much, had yet left much more to be done. Subsequently to these, Mayer published an elaborate theory of the moon; but his co-efficients required much correction, the results of his computations being in some cases found to differ very widely from observation. A much greater degree of accuracy was attained by La Place, who bestowed particular attention on the influence of minute quantities in every part of theory. In the present paper the author has endeavoured to introduce further improvements in the lunar theory, by carrying the approximations considerably further than they have hitherto been made. In the solutions of the problem given by former mathematicians, the chief obstacle to the attainment of accuracy was the extreme length and labour of the necessary computations. Another object, therefore, which the author has had in view, is to facilitate these computations, and render them less appalling. This he endeavours to effect by the employment of certain artifices, by which the multiplicity of small terms will, with their co-efficients, be reduced within a practicable compass, and their numerical computation rendered less laborious. The co-efficient of the equation depending on the moon's distance from the sun, affords the means of calculating the sun's horizontal parallax. For this purpose, La Place has computed this co-efficient with greater accuracy than the rest, and he makes the sun's parallax nearly 9". The author's theory gives it little more than 8½", which is very near the mean of the various results obtained by the observation of transits. He thinks that there is therefore great reason to conclude that its true value is about this quantity.

SOCIETY OF ANTIQUARIES.

MR. HAMILTON, V. P. in the chair.—A communication was read from A. Bartholomew, Esq. with a representation of some ancient painted and glazed tiles found in digging a cellar near Clerkenwell Green, about five feet beneath the present surface. Mr. Britton exhibited drawings of Brixworth Church, Northamptonshire, and Jury Wall, Leicester, as specimens of Roman architecture; also of the south transept (exterior) of Beverly Minster, the south porch of Malmesbury Abbey, and three views of Warwick Castle. The Chevalier Brousted shewed two splendid Grecian bronzes, found in Italy, near Tarentum, on the spot where Pyrrhus fought his first battle with the Romans. In the execution and anatomical expression of the figures they are exquisite: they appeared to be shoulder-pieces for connecting the back and front parts of the gorget, and had evidently been gilt. It was observed, that it had been related, that Pyrrhus, in the contest alluded to, had worn golden or gilt armour, and that he was on that account so conspicuous, that during it he changed his armour; which afforded a presumption that these magnificent remains of Grecian art might have been part of his armour. The secretary read a further portion of the Rev. John Skinner's letters on the site of Camelodunum;—but the reverend gentleman was (and we say it with due respect to an antiquary of no mean talent) so erratic and diffuse, that it was impossible to follow him in any of the details of his paper, from merely hearing it read.

FINE ARTS.

ROYAL ACADEMY.

MR. PHILLIPS has commenced his course of lectures at the Royal Academy; but, however well calculated to lead the student on to eminence in his profession as a painter, (and a guide superior to Mr. P. could no where be found), they do not demand our detailed report, as they are the same as last year, when we paid them due attention.

BRITISH INSTITUTION.

[Sixth notice.]

HAVING gone through the rooms of the Gallery, we shall conclude by noticing a few of the works of talent which have hitherto escaped us.

No. 7. *A Cottage Child asleep*. T. Barker.—A subject always interesting, and treated by Mr. Barker in a very painter-like and old-masterish manner.

No. 21. *Boy with Whittings*. Miss Emma Jones.—Very creditable to the fair artist.

No. 94. *Cottage Children with their Pets*. T. Woodward.—The excellence of this picture entitles it to be made a pet by the fortunate possessor, whoever he may chance to be. The study of the ass, and the beauty of the execution, have never been surpassed.

No. 116. *Country Gossip—Morning*. John Tennant.—Those who wish to see the light and freshness of morning, without the trouble of early rising, should go and gaze on this clever work.

No. 312. *Othryades*. F. Pickering.—A good deal in the style of the French school of art. The dying Spartan is well drawn; and the accompaniments are carefully and skilfully painted.

No. 132. *The Loiterer*. R. Farrier.—The youngers at the well have mischief and audacity enough to disturb a whole village community, much more the temper and patience of the old dame in the back-ground. Mr. Farrier, like Mr. Webster* (whose pictures of "the Culprit" and "the Catholic Question" entertain and delight us more and more the oftener we look upon them), seems to luxuriate in representing the various youthful arts of "ingeniously tormenting."

No. 461. *The Falconer*. Joseph Severn.—One of the best examples of Mr. Severn's talents that we remember to have seen.

No. 135. *Old Widow*. N. Condry.—Mr. Condry has in this performance united the concentrated effect of Rembrandt with the cabinet pencilling of Teniers.

No. 206. *Numidian Lion-Hunt*. F. Howard.—A spirited representation of exploit and danger: perhaps a little too monotonous in colour.

No. 66. *Saturday Night*. T. Clater.—A sort of cupboard-love subject; in which the youthful sweetheart, contriving to arrive in pudding time, is fortunate enough to be welcomed by the father as well as by the daughter. It is an admirable piece of fire-light, executed with great truth and skill.

No. 145. *The Lake of Nemi*; No. 157, *The Lake of Albano*. Miss E. Rawlinson.—As well as we can judge from their elevated situation, deserving of much better places. The same may be said of No. 168, *A Lane in Warwickshire*. T. Creswick.

No. 143. *A View at Finchamstead, Berks*.

* Upon this most promising artist's *Fair-day* we may reverse what Faletta says, "If I be not ashamed of my soldiers, I am a soused gurnet. I have misused the king's press damnably." On the contrary, Mr. Webster has every reason to be proud of his recruits, and of every picture he has this year contributed to adorn the gallery.

E. Lane.—A fine sunshiny effect; so well managed, that a visit to the spot itself could hardly afford us more pleasure.

No. 44. *View on the Maase near Rotterdam*, C. Deane; No. 60. *Taken by Surprise*, R. Farrier; No. 65. *Swiss Peasants*, H. Mundy; No. 87. *Jaques*, James Stark; No. 89. *Hampstead Heath*, T. C. Holland; No. 131. *The Domestic Friends*, S. M. Smith; No. 181. *A Priest at an Altar*, Harry Willson; No. 190. *The Remembered*, B. R. Faulkner; No. 222. *Sooty Firs at Woburn Abbey*, H. W. Burgess; No. 224. *Landscape*, J. A. O'Connor; No. 234. *Smugglers alarmed*, W. Derby; No. 288. *A Stable in Hampshire*, G. Jones, R.A.; No. 363. *An Old Warrener*, J. Inskipp; No. 380. *Helena de Narbon*, T. Warrington; No. 388. *The Thames at Petersham*, G. Hilditch; No. 402. *A close woody Soene*, B. Barker; No. 423. *Lane Scene near Norwich*, G. Vincent; No. 456. *Scene at Dolgiem near Dolgelly, N.W.*, F. C. Lewis; No. 457. *Chapeau Noir*, B. R. Faulkner; No. 477. *The Mollah Hadan recognising Hayah Baba*, C. Hamilton; No. 517. *The Gondola*, J. Stephanoff, &c. &c., are all well deserving attention.

Of the sculpture there is little which has not already appeared before the public. *A Falconer, in marble*, by J. E. Carew, is a spirited figure. *Hæmon and Antigone*, an elegant group by F. W. Smith; and a head of *Flora*, by T. Sharpe, are among the best of the novelties.

ARTISTS' AND AMATEURS' CONVERSAZIONE.

THE above Society held its second meeting on Thursday the 17th ult., in a brilliantly-illuminated suite of rooms, hired by the committee for the season, at the London Coffee House, Ludgate Street. The display of all kinds of specimens of art was uncommonly splendid, comprehending works of the president and most of the other members of the Royal Academy, as well as numerous efforts of rising talent. The meeting was numerously attended, nearly one hundred persons being present, and amongst them many distinguished characters.

SCULPTURE.

WE have just had time to take a glance at the exhibition of sculpture, opened to private view to-day, by Mr. Lawrence Macdonald, the celebrated Scottish artist. Scotland has not been prolific of sculptors, and we rejoice to see works of so much genius offered to the inspection of their southern neighbours from that country. Mr. M. has some noble heroic and classical compositions, in which style he seems to excel; but he has also shewn powers in the representation of female loveliness. Among his range of busts, we recognised striking likenesses of several distinguished persons. Altogether, his efforts do honour to his native land, and are splendid monuments of his own abilities.

NEW PUBLICATIONS.

The National Portrait Gallery of Illustrious and Eminent Personages, particularly of the Nineteenth Century. With Memoirs, by William Jerdan, Esq. Nos. XX., XXI., XXII., XXIII. London, 1830. Fisher, Son, and Co.

WE have, for very obvious reasons, considerable difficulty in speaking of this publication; yet it would be unjust to debar it from notice in those pages which continually offer fair reports upon works of far inferior merit and importance. Our only resource (and we care not

if it expose us to malicious comment) is to state the truth candidly, and leave the truth to the judgment of our readers. We feel confident in their confidence, and in having deserved it; and therefore need only state that these criticisms emanate from the pen of a gentleman intrusted with the department of our Journal to which they belong; that the editor has such entire reliance upon his impartiality and integrity, that he would deem it an affront to alter a syllable he had written; and that so far from the connexion being likely to augment the praise bestowed, its tendency is rather unfavourable to Messrs. Fishers' deserts, since a sense of delicacy prevents that panegyric which their efforts would otherwise so often command.—Ed.

Part XX., besides three beautifully executed portraits, from pictures by Beechey, Jackson, and Hoppner, contains memoirs of the Duke of Kent, the Earl of Harewood, and Archdeacon Nares.

The general reflection included in the following paragraph from the memoir of Lord Harewood, we have never before met with in print, although we fancy it must have frequently occurred to the political observer:—

"Since his elevation to the House of Lords, on the decease of his father in 1820, we have little to record of the senatorial efforts of the Earl of Harewood. It is remarkable how many able and efficient commoners retire into the silent performance of their duties, when they become members of the upper house. No doubt this may in a great measure be accounted for, from the circumstance, that few questions can arise in that place to affect represented interests, or demand individual exertion, beyond an honest vote; but still it is curious to behold the most active members of the House of Commons become, as it were, suddenly obliterated by removal into another sphere of usefulness. Far are we from wishing that the same ardour for debate were felt in both; and we simply notice the fact as a corollary to our sketch."

After an enumeration of "the meritorious efforts in the cause of morality and learning," of the late venerable and lamented Archdeacon Nares, his character is thus summed up:—

"In private life no man was ever more beloved than Archdeacon Nares. His friends from youth to old age were delighted by his talents; while they were compelled to set a still higher value upon his individual character, as estimable and honourable in every relation of life. To know him, indeed, was to be attached to him; for the exemplary divine, the profound scholar, the judicious critic, and the elegant writer, was at the same time one of the most amiable, pleasing, and instructive companions into whose society good fortune could throw either the young or the old. No wonder, then, that his intimacy was zealously courted, and that he ranked among his most constant friends a number of the foremost men of the times which he himself lived to adorn."

Of the beautiful portraits which ornament No. XXI. we have already spoken. The narrative, brief but authentic, of the splendid military career of the Marquess of Anglesey, and the sketch of his political character, will be read with peculiar interest at the present moment; when the welfare of so important a part of the British empire, under circumstances of singular delicacy and difficulty, is intrusted to his wisdom's care.

From the memoir of the Earl of Carlisle we extract the following passage, illustrative of the cause of the severe attack made by Lord

Byron upon Earl Frederick, the father of the present earl.

"It will be recollected by our readers how bitterly he was assailed by his relative Lord Byron, in his literary character; and we refer to the matter, for the purpose of throwing some light upon this incident, which none of the biographers of Lord Byron have yet done. Lord Carlisle was related to our splendid poet by the marriage of his grandfather Henry, the fourth earl, to Isabella, the great-aunt of Byron: and we are informed, that the mother of the latter, a wayward woman, had, from his childhood upwards, prejudiced his mind against his paternal relations. It was not, therefore, surprising that, with a temperament like his, and impressed with erroneous feelings, he should, at the first semblance of an occasion, mistake civility for affront, and throw himself back on his native pride and resentment, instead of looking fairly at the circumstances which gave rise to his anger. It was then he struck the blow, which he afterwards repented, and in some measure recalled. The offence, we believe, was on account of Lord Carlisle's declining to introduce him to the House of Peers, when he took his seat; and also referring him for his pedigree to the Herald's College, previous to the issue of the writ. But it seems to have been his own temper, and not the facts, which could afford materials for so much spleen: the Earl of Carlisle never meant to treat Lord Byron alightingly, by pointing to him the only place where his pedigree could be made out; and with regard to the introduction, it is not consistent with the rules of the house, for a peer of a superior to introduce a peer of an inferior degree. A peer by descent, after receiving his writ, indeed, takes the oaths at the table without any introduction; and a peer newly created is introduced by two peers of his own rank. But, misinformed on these points, Lord Byron gave way to his passions, and endeavoured to stigmatise, or rather turn into ridicule, the party who had so unconsciously offended him."

The memoir of Sir John Franklin details that gallant officer's services in his profession; and contains an epitome of those voyages to the arctic regions, in which, and more especially in the second of them, he exhibited a courage, a perseverance, an endurance of unprecedented fatigue, hardship, and suffering, in the highest degree honourable to human nature.

The late Right Hon. William Huskisson, the late Lord Chief Justice Ellenborough, and the gallant Vice-Admiral Sir Edward Codrington, furnish the subjects for No. XXII. The memoirs of these three distinguished individuals are accompanied by portraits—of the first, from a picture by Graham (painted only three months before Mr. Huskisson's death), in the possession of John Gladstone, Esq.; and of the two others, after pictures by Lawrence;—all of which are exceedingly creditable to the respective artists employed upon them. The portrait of Mr. Huskisson, in particular, must be generally interesting, in consequence of its originality, of the fidelity of the resemblance, and of the recency, and melancholy circumstances, of the death of the highly gifted and deeply lamented statesman whom it represents.

The memoir of Lord Ellenborough contains an interesting letter from his late majesty George IV. to that eminent judge, on his retiring from the Court of King's Bench. It is singularly warm and friendly; but as it has been quoted by almost every newspaper, we shall not repeat it here.

Part XXIII., which has just appeared, con-

tains Lord Tenterden, Sir George Murray, and Herbert Marsh, Bishop of Peterborough—the robe, the sword, and the mitre. The portrait of Sir George Murray is after Lawrence, by H. Meyer; the other two from drawings by J. W. Wright for this Gallery, and engraved by W. Holl and J. Cochran. In the memoir of the learned prelate is the original letter of the premier, Lord Liverpool, offering him, in the prince regent's name, the unsolicited bishopric of Llandaff, as a testimony of his meritorious services and zealous exertions in the cause of religion and learning. This transaction was most honourable to the minister, to the royal head of the church, to the church itself, and to the individual member of it, Dr. Marsh.

Upon the whole we are free to say, that this Portrait Gallery well earns its very extensive popularity; for it can boast of original and well-executed portraits at a price which nothing but an immense sale could render possible; and the memoirs have at least great pains taken to ensure their authenticity.

Elizabeth, Dowager Countess of Errol. By Dean, from a Miniature by Cosway.

THIS beautiful portrait is the seventy-fifth of the series in *La Belle Assemblée*; and a more lovely countenance has not adorned it. There is nothing of the dowager in the exquisite sweetness of the young creature here represented, whose large dark eyes and delightful expression seem enough to detain a husband in this world almost in defiance of death.

The National Menagerie, No. I. to XI. inclusive. Published by S. Maunder.

THE Numbers of these studies of zoology from nature, consist each of a single print, of about twenty-two inches by sixteen, and representing various animals, of a sufficient size to distinguish all their characteristics: they are rendered still more perfect by being carefully coloured from the life. The design is an excellent one, and the execution so beautiful, that every plate might be framed as a picture to ornament the study, the sporting-box, the hotel, or any other place where such subjects are appropriate; and for the portfolio the series is quite a treasure. It begins with Bengal tigers and cubs, No. 2. wolves, 3. chetahs, or hunting leopards, 4. the leucorix or white antelope (an elegant animal), 5. American and black panthers (a fine contrast), 6. the Barbary lion in solitary majesty, 7. lamas, 8. royal striped tiger, 9. the giraffe or camelopard, 10. wapiti, and 11. the extraordinary and fatal combat which accidentally took place in the Tower on the 3d of last December, between a lion and a tiger and tigress. This conflict, which was perfectly appalling, is given with much spirit; and from the situation of the monarch of the animal world, between his two powerful and sanguinary adversaries, it is not difficult to foresee the probable result. The fact was, that he was so grievously wounded as to die within a few days. The various agitation, the roaring, howling, and shrieking, the signs of fierceness and horror of the other inmates of the Tower during the struggle, we are told surpassed all description. We have to repeat, in conclusion, that the general merit of these prints is such as to deserve a wide popularity; for the habits and actions of the beasts are seized with genuine spirit, and the details throughout are true to nature. They are, indeed, mostly portraits of individuals now living in the Tower, Zoological Gardens, &c. &c.

Vandyke. Drawn on stone by Miss Sambourne. Engelman, Coindet, and Co.

WE are assured that this is the first essay of a lady. It is a very fine specimen both of taste and art; and we are sure if Miss S. goes on as she has begun, the critics themselves who could resist her claims, would be harder and worse than stones.

Heath's Historical Illustrations of Scott's Novels, &c. No. II. Rob Roy. Jennings and Chaplin.

Six engravings to illustrate *Rob Roy*, by eminent artists, and excellently engraved. *Rob Roy's Wife*, with the Baillie dragged before her by her wild followers, is distinguished among the rest as a spirited composition. It does great credit to the talents of H. Corbould. The others, though appropriate, have nothing particularly striking, and the costume of the period is hostile to picturesque effect.

MUSIC.

SOCIETA ARMONICA.

THE second of these favourite concerts was held on Monday last. The music of the first part, though of the finest, and faultlessly executed, was of too sombre a cast throughout, since, owing to this sameness, it lost that effect which a more judicious variety in selection would have afforded. The burden of the vocal department rested upon Miss Paton,* Messrs. Philips, and Bennet. The leader (Spagnoletti) and the conductor (Forbes) performed a delightful duet, "*C'est une larme*," with admirable precision. In the second part a more enlivening diversity awaited us. Philips sang the "*Lass of Loch Lomond*" in a rich and manly strain, and was followed by Mr. Chatterton, who executed "the *Reminiscences of England*" on the harp in a very brilliant and spirited manner. Miss Paton, the only lady who sang during the evening, but a host in herself, gave the ballad "*She never blamed him, never*," with unequalled power and pathos, and was rapturously encored, *nemine contradicente*. The band was full, and finely disciplined; and, if we may judge from the satisfactory manner in which the exertions of the performers at these concerts are received, they bid fair, if not to increase, at least to retain their deserved popularity.

DRAMA.

KING'S THEATRE.

ON Saturday, in *Matrimonio Segreto*, Lablache gave us his admirable delineation of a deaf man, and sang like a man possessed of a very fine ear; his *Geronimo* is, indeed, a delightful contradiction. David, in *Paolino*, has not a prominent part; but we like to see principal singers do as he did with it—the most. E. Seguin, who has been astonishing the world with his splendid *Polyphemus* at the Queen's Theatre, shewed himself not only the possessor of a noble bass voice, but also, already, a very good actor at the King's. Madame Vespennann does not seem to please the English audience; and we are sorry to say they manifested their disapprobation in an unequivocal and rather coarse and ungallant manner on this

occasion. Miss F. Ayton acted better than she sang: she is a nice little creature, though not quite at home in Italian opera.

One of the grandest pageants we ever witnessed on the stage was produced here on Thursday evening, by Mr. Deshayes. Sir W. Scott's *Kenilworth* has furnished the materials, and the plot of that admirable novel is pretty closely adhered to. In fact, the piece is a tragic pantomime. There is nothing to speak of in the way of ballets more than may be met with in almost every melodrama on the French stage; a fête being considered indispensable, whether the subject be ancient or modern, historical or legendary. In the present case, the dancing occurs in the first act, amongst the peasantry, who are holiday making in the neighbourhood of Cumnor Place; and in the third, in the gardens of Kenilworth, before "the queen's majesty." A *pas-de-trois*, by the Earl of Leicester (!) and two of the court, setting aside the un-common sense of the thing, was most admirably executed, and loudly encored, the dancers being Lefèvre, Paul, and Madame Montessu. It was followed by a dance of gods and goddesses, in the old style of the French ballet, which was imagined and executed with considerable whim; but it would have been more in its place at the court of Louis XIV. than at that of Elizabeth. The horrible catastrophe is preserved. Brocard, as *Amy Robsart*, is presumed to break her beautiful neck, and the curtain falls on the agonies of Leicester. We fear there is too much acting and too little dancing to please our opera audiences; but the liberality exhibited in the production of the piece deserves, and we trust will obtain, its reward. The scenery, by Mr. W. Grieve, is in that clever artist's best style; and the costumes, banners, and other paraphernalia, most magnificent and correct. The arrival of the queen in her barge, at Greenwich, is one of the most real and picturesque exhibitions ever attempted. When we add, that the porter at the gate of Kenilworth Castle is "a real giant," full seven feet high, our readers may imagine the attention bestowed upon the details of this gorgeous entertainment.

ADELPHI.

PERPETUAL novelty is as moving a principle as general merit in this popular theatre. On Monday a new vaudeville, in six staves and two acts, called *Bringing Home the Bride*, was produced with much success. It is the French *Voyage de la Mariée*, rendered into English by Mr. Moncrieff, and consists of the adventures of a newly married couple (Reeve and Mrs. Fitzwilliam), on their way from Richmond to Cheapside, in which they are separated, and the bride sore beset. There is a good deal of originality and humour in this piece—some coarse matters, which were, we trust, cut out after the first night—and a great deal of clever acting and pretty scenery. We have always had so much to commend in this delightful resort, that we will only say, that nothing on earth can induce us to allow the appearance of the sweet and absolutely feminine Mrs. Yates in the male garb of the attorney's clerk. It is not to be borne.

VARIETIES.

Experiments on the Action of Cold on Animals.—The experiments of M. Flourens on the action of cold on animals establish that it is not only on organisation and life taken collectively that cold acts, but that it has a principal and determinate action on the respira-

tory organ, which it affects in two ways; the one, which produces an active inflammation, is promptly mortal; the other, which causes a chronic inflammation, that is to say, pulmonary consumption; and that a mild and constant warmth not only prevents the invasion of consumption, but often stays its progress.

Improvement of Wool.—The *Quarterly Journal of Agriculture* objects to Mr. Petre's new theory for the improvement of the wool of sheep, noticed in a former number of the *Gazette*. The period at which sheep can be shorn of their covering, they say, is sufficiently marked by the state of the wool itself; and a repeated shearing of the fleece of young sheep would be a violence done to nature, and could scarcely fail to injure or destroy the health of the animal. Although it is not in our power to subject the question to experiment, we do not coincide in these views; and think it might just as well be argued, that shaving the head of young people does violence to their constitution, and destroys the crop of hair, as mowing a field annihilates the crop of grass.

On preventing the Discharge of a Bullet from a Gun by the Finger.—At the sitting of the Helvetic Society of Natural Sciences of the 28th July last, a letter was read from Dr. Flachin of Yverdon, relative to an experiment, before mentioned to the Society, in which the ball was prevented from leaving the bottom of a musket when the gunpowder was fired,—simply by putting the ramrod upon the ball, and the end of the finger upon the ramrod. This experiment requires great care, especially as to the strength of the piece, which is very liable to burst in its performance.

Discharge of a Jet of Water under Water.—Mr. Fox states, in the *Philosophical Magazine*, that a jet of water discharges the same quantity in water as in air, in a given time, without reference to the depth or the motion of the water, at least within certain limits.

To restore the Elasticity of damaged Feathers.—A feather, when damaged by crumpling, may be perfectly restored by the simple expedient of immersing it in hot water. The feather will thus completely recover its former elasticity, and look as well as it ever did. This fact was accidentally discovered by an amateur ornithologist of Manchester.

Nursing!—"Among the superstitious notions which still exist in Normandy, there is one, connected with the treatment of children, which will never, I hope, be put to flight by modern philosophy, unless it be able to replace it by common sense: it is believed that the Virgin Mary sweetens the food of infants,—a notion which saves sugar, and prevents the stomach of children from being overloaded with sweets. As the child grows up, however, the Virgin ceases to interfere with its victuals, which is remarkably judicious."—*St. John's Residence in Normandy.*

"After the capture of Rhodes by the Turks, to mark their deep sense of the calamity that had befallen the order, the Hospitaller-nuns, who had hitherto worn a red robe with a black mantle à bec, on which was a white cross, assumed a habit entirely black, in token of mourning, which they continue to wear to this day."—*Achievements of the Knights of Malta.*

Lunar Rainbows.—It is a very prevalent error that these phenomena are of exceedingly rare occurrence. The fact is otherwise, at least in relation to Cornwall, and, probably, to all other localities where showers are frequent. In the western part of that county, a correspondent states to us, there is scarcely an indi-

* We are somewhat puzzled by the programmes, bills, cards, &c. whether we ought to designate this lady as Madame or Mademoiselle. Settling aside, however, these varied aliases of the same person, *εὐλαστὸν σπουδῆς* *μαρτυροῦν*, no one who hears her will doubt but that "by any other name she'll sing as sweet." In fact, the envelope to the Armonica cards designates her as "Mrs. Wood, late Miss Paton."

vidual in the habit of being out late at night, who does not repeatedly witness them.

The Deaf and Dumb.—During the last year a very large workshop has been erected at the Institution for the Deaf and Dumb at Toulouse, where the pupils, who belong to the industrious classes, receive such instruction in mechanical operations, as will afford them the means of maintaining themselves on their return to society.

Scientific Intelligence.—Dr. Brewster and Mr. Faraday have been chosen honorary foreign members of the Imperial Academy of Sciences at St. Petersburg.

The Skeleton Man.—A report was lately made to the Académie des Sciences, with respect to an individual, known, in consequence of his extreme leanness, by the name of the Skeleton Man. Nothing extraordinary appeared about this person until he was thirty-four years of age. He was a soldier, and was enjoying good health, when, being wounded in a battle, he was left for three days on damp and cold ground. Transported to a house, where proper care was taken of him, he was seized with a sleep, which lasted, almost without interruption, for three months. From that time his emaciation commenced, and continued until it left him in the condition in which he now is. His muscles are so reduced, that they have become flat cords, invisible on the surface. Nevertheless, he exercises locomotion without difficulty, and grasps forcibly enough a hand presented to him. In the three years which have elapsed since the commencement of his malady, the weight of his body has been reduced from 135 (French) pounds, to 58; and his height, which was 5 (French) feet 3 inches, has shrunk 2½ inches. His skin is hard and dry; nevertheless, the sense of touch does not seem to be impaired. It appears to be the same with his other senses. Even his sight is good, notwithstanding a chronic ophthalmia with which he has for some years been afflicted. The heart has shared in the general atrophy of the muscles; and, as far as can be judged by its beatings, does not exceed in size that of a kitten. He eats and drinks almost as much as a healthy man; and the various functions are performed with great regularity. His intellect seems perfect. Since the period at which his emaciation was already great he has had four children, who had nothing extraordinary in their appearance. One of them is dead, but the others are in good health.

Zoology.—The collections recently brought from India by M. Dussumier, for the Museum at Paris, are of great value. When the weather permitted, M. Dussumier never lost an opportunity of fishing; at Sechelless, the Isle of France, Bourbon, Saint Helena, on the coasts of India, in the rivers, and even in the deep sea; in consequence of which he has obtained a vast mass of fishes, some of them entirely new, others of which only imperfect specimens had hitherto been procured. He has also brought from India quadrupeds which have never been seen in Europe in modern times, but with which the ancients were nevertheless acquainted; such as the four-horned antelope, mentioned by Elian, and in cabinets; of which nothing is to be found in the collection of skulls, except an incomplete head. This animal, which M. Dussumier brought alive from Bengal, died on its way from Bourdeaux to Paris; but its remains have been preserved. Another rare animal, the long-lipped bear, has been more fortunate, and is now in the Parisian menagerie.—M. Dussumier

is desirous of returning to Canton and Manilla, to make further researches; and M. Cuvier has proposed to the French Academy to defray a portion of the expense of the expedition.

Meteorology.—It appears from observations made at the Royal Observatory in Paris, that, in the year 1830, the number of fine days was 164; of cloudy, 181; of rainy, 149; of foggy, 228; of frosty, 28; of snowy, 24; of alesty, 8; of thundery, 13.—The wind was northerly 44 times; north-easterly, 23 times; easterly, 17 times; south-easterly, 23 times; southerly, 74 times; south-westerly, 69 times; westerly, 71 times; and north-westerly, 47 times.

Wedding Rings.—It is notorious that a powerful superstition exists among married women with respect to their wedding rings. Nevertheless, a female society has been formed at the Polish town of Suwakki, having for its object to collect wedding rings, to assist in the maintenance of the Polish army. A great number have already been devoted to that purpose. We very much fear that some of the Polish ladies will lose their husbands as well.

New Mineral: Pyrophyllite.—M. Hermann has detected a new mineral species, which he calls pyrophyllite, under the radiated talc from the Ural. Before the blowpipe it exfoliates flabelliform to a great mass. The formula is $M^2 Si^2 + 3 Al^2 S^2 + 10 H$.

Champagne.—A French journal, advertising to the fact that, in consequence of the duty, Newcastle coals are sold at a cheaper rate in Egypt than in London, says, that Champagne, from a similar cause, is sold at a cheaper rate in South America (a distance of 4,500 leagues) than at Paris!

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. X. March 5.]

Songs of Social Hours, being No. 1. of Minstrel Melodies; by H. B., author of "the Garland," &c.—A Series of Engravings from the Works of the Members of the Society of Painters in Water Colours is announced, with the honour of a dedication to the King. It is undertaken with the sanction of the Society, and is intended to comprise a selection of the most admired works which have appeared in the past, as well as those which may be produced in future exhibitions.

LIST OF NEW BOOKS.

Lardner's Cabinet Cyclopaedia, Vol. 16 (History of Maritime and Inland Discovery, Vol. 3), fcp. 6s. bds.; Cabinet Library, Vol. 3 (Annual Retrospect of Public Affairs for 1831, Vol. 1), fcp. 6s. bds.—Dibdin's Sunday Library, Vol. 3, fcp. 6s. bds.—Weber's Anatomical Plates, Parts 1 and 2, 21s. each.—Gilly's Waldensian Researches, with Plates, 8vo. 21s. bds.—Vincent's Explanation of Moral Rights, 8vo. 7s. bds.—Jones on the Distribution of Wealth, 8vo. 7s. 6d. bds.—Cary's Dante, 3 vols. fcp. 18s. cloth.—Tri-glott Testament interlinear, Part 1, 8vo. 4s. 6d. sewed.—Assassins (the) of the Paradise, &c., 8vo. 7s. 6d. cloth.—John's (James Augustus St.) Anatomy of Society, 3 vols. post 8vo. 18s. bds.—Parliamentary Debates, Third Series, Vol. 1, of Sessions 1830-31, royal 8vo. 12 10s. bds.; 12 13s. 6d. hf.-bd.—Hughes's Divines, Vol. 10 (Barrow, Vol. 8), 8vo. 7s. 6d. bds.—Family Classical Library, No. 15 (Tacitus, Vol. 9), 18mo. 4s. 6d. bds.—Knapp's Greek Testament, 18mo. 6s. bds.—Aldine Poets, Vol. 10 (Poems of the Earl of Surrey), fcp. 6s. bds.—Johnson on the Change of Air, 8vo. 8s. 6d. bds.—Album (the) of Emily and Isabella, square 18mo. 2s. 6d. hf.-bd.—Knowles's Life of Henry Fuseli, 3 vols. 8vo. 2s. 2s. bds.—Gore's Historical Traveller, 2 vols. post 8vo. 14s. bds.—Standard Novels, No. 1 (the Pilot), fcp. 6s. bds.—Archbold on the Poor Laws, 2 vols. royal 18mo. 11s. 8s. bds.—Godwin's Thoughts on Man, 8vo. 14s. bds.—Crotchet Castle, 18mo. 7s. 6d. bds.

Wind S.W. and N.W.; the former prevailing. Alternately clear and cloudy; rain fell every day except the 1st.

Rain fallen .575 of an inch.

Lunar Eclipse.—Never, perhaps, was an eclipse of the moon seen under more favourable circumstances than that of the 26th ult. The atmosphere being, except from a few strata next to the eastern part of the horizon, peculiarly clear, the moon first appeared at 40 minutes after 5 (clock time); and from that time till 35 minutes after 6, when the eastern shadow quitted the western limb of the moon, remained perfectly unobscured by clouds; the penumbral shadow, however, was visible till about 35 minutes after 6.

Edmonton.

CHARLES H. ADAMS.

Extracts from a Meteorological Register kept at High Wycombe, Bucks, by a Member of the London Meteorological Society. February 1831.

Thermometer—Highest..... 60-50°

Lowest..... 9°

Mean..... 38-66394

Barometer—Highest..... 30-03

Lowest..... 29-68

Mean..... 29-5813

Number of days of rain or snow, 18.

Quantity of rain and melted snow in inches and decimals, 3-8683.

Winds.—1 East—11 West—0 North—3 South—2 North-east—4 South-east—4 South-west—3 North-west.

General Observations.—On the first three days of the month snow fell heavily, and the total quantity measured 17½ inches; but on the 4th a thaw commenced, and, with the trifling exception of a quarter of an inch more snow on the 6th, continued until the whole had disappeared. The melted snow and rain amounted to 3-8683 inches, which was more than for some years. The barometer was lower than in the last two years in the same month; the mean of the barometer, on the contrary, was above those in the same period; and the maximum of heat higher than observed at Wycombe in the February in the last eight years. A very distinct lunar halo observed on the night of the 25th. The evaporation 0-11875 of an inch.

TO CORRESPONDENTS.

We have been unable to complete our perusal of Captain Beechey's delightful volume in time for this No.; and must hold it in reserve, with several other novelties of public interest. Indisposition will also, we trust, plead for us to numerous Correspondents.

To the Junta of — we shall merely say, that a whole company of fools may be entertaining for a while—it is only one fool at a time that is so very irksome.

We would indulge the natural tenderness of G. B., but that we have rarely found the out-pourings of private feeling generally interesting; and our pages are for the many.

W. E. T. may read an answer in the above, independently of the length of the lines "to a spirit of the departed."

M.—The bad division of the lines, &c.

In answer to Lyricus, we are aware that the demand of Two Guineas for licensing a single song if introduced upon the stage, is made by the present Deputy Licensor; and believe, with our correspondent, that the practice has originated with that gentleman. It certainly appears to be a strange thing to charge as large a fee for perusing ten lines as for examining a five-act tragedy; particularly as that fee is a gratuity for expediting business, paid to an officer who has a regular salary for doing his duty.

A. W.'s Sonnet is by no means a sonnet—ten lines are poor measure.

We cannot answer Z. Z. Z. precisely at present.

We thank a Reader of the Gazette for Ten Years, and will keep his communication in view.

Upon looking attentively at the charge of partiality and favouritism in the recent award of honours and degrees at the University of Cambridge, we are compelled to decline entering upon the subject. We are desirous to lend our aid to the remedy of any abuse; but so grave an accusation must lead to much controversy; and our weekly sheet is hampered to find room for the pressing calls upon it to fulfil its own plan of being as complete a record as possible of the literature, science, and arts of the day.

We are sorry we cannot find room this week for Mr. Trevelyan's very interesting experiments on heat, which are ably stated in the Edinburgh Courant.

We would refer the curious in animal phenomena to our report of the Eclectic Society, page 152, where the most remarkable instances of reproductiveness we ever heard or read of are detailed.

Corrigendum.—The opinions of the gentleman to whom we owe our reports of the Society of Antiquaries, it would be seen from our last Number, differ widely from those expressed under the head of Varieties, on the question of removing the Screen in York Minster. As we have stated elsewhere, we do not feel justified in altering the MSS. of valued and impartial contributors; still we hold it right to mark our own sentiments where they happen to disagree.

ADVERTISEMENTS,

Connected with Literature and the Arts.

BRITISH INSTITUTION, Pall Mall.

The Gallery for the Exhibition and Sale of the Works of British Artists is Open Daily, from Ten in the Morning till Five in the Evening.

Admission, 1s.—Catalogue, 1s.
WILLIAM BARNARD, Keeper.

AT an established LADIES' SCHOOL of

the highest respectability, about four miles from Hyde Park Corner, Young Ladies are received for Board and General Instruction, at Thirty Guinea per Annum. Professors of the first eminence attend to give instruction in Italian, French, Harp, Piano-Forte, Drawing, Dancing, and Writing.

The Pupils may be allowed to remain during the Holidays—terms, Four Guinea each Vacation. There are Vacancies for Two Young Ladies as Parlour Boarders, who may remain during the Vacations without any additional charge being made. Apply by letter (post-paid) to A. B., Post-office, Turnham Green; 77, Newgate Street; or St. Fore Street.

REFORM.—The OBSERVER of

Sunday, price Seven-pence, will contain an Exposé by Lord Russell, to the extent of Five of the Observer's Columns. It may suffice to state that this Report of Lord Russell's Speech is abridged from Wednesday's Morning Chronicle.

A Monday edition of the Observer, price Seven-pence, peculiarly adapted for Country and Foreign Circulation, is regularly published at Four o'clock every Monday Afternoon, at No. 106, Strand.

THE late LIEUT.-COLONEL DENHAM,

the African Traveller. Colnaghi, senior, Dominic Colnaghi, and Co. Printers to their Majesties and the Royal Family, Pall Mall East, have the honour to inform their Friends and the Public, that they will shortly have ready for publication, a Portrait of the late Lieut.-Col. Denham, P.R.S. from a Picture painted by T. Phillips, Esq. R.A. and engraved on Steel, by Mr. Broomley, Junr.

Proofs, 15s. 5s.; Prints, 12s.
A finished Proof may be now seen at the Publishers'.

MUSIC.

Popular Journal of Music.
Price 2s. the Third Number for 1831, of

THE HARMONICON.

London: Mayhew and Co. 17, Old Bond Street.

BOOKS PUBLISHED THIS DAY.

Hughes's Divines of the Church.

1st March was published, price 7s. 6d.

WORKS OF DR. ISAAC BARROW,

Vol. V.; being No. 10 of the Divines of the Church of England, continued monthly, with a Summary to each Discourse. Notes, &c. In this edition are given the hitherto unpublished Sermons of Dr. Barrow.

No. XIII. will commence a Selection from the Writings of Jeremy Taylor, with a Memoir by the Editor. The first Five Numbers contain the only complete edition of Sherlock's Works.

Printed and published by A. J. Valpy, M.A. Red Lion Court, Fleet Street; and sold by all Booksellers.
Any Author may be had separately.

In consequence of repeated applications, it is intended to commence a New Monthly Subscription of the Octavo Edition of the

DELPHIN CLASSICS, with the

Variorum Notes.

Edited and printed by A. J. VALPY, M.A.

To commence on the 1st of March, 1831.

The Delphin, Bipont, and Variorum Classics, are rendered comparatively needless by this comprehensive edition, in which is incorporated, for the first time, the substance of the three; and the value of the Delphin, in most particular, enhanced by the insertion of the various readings contained in all the principal editions of each Author.

The price is 12s. in each Part; large paper double. Very few copies are printed beyond the first subscription, which amounted to 500 large and small. The whole work forms 141 Parts. The best indices are used, and not that of the Delphin, as has been erroneously stated. The Delphin Notes, Interpretatio, and the Various Readings, are placed under the Text; and the Notes in the best Variorum edition are printed at the end of each Author.

The best indices are adopted, and carefully collated with the Text, to remove the present numerous faults in the references. The reference is made to the Book and Chapter, and not to the page, so that the same Index will apply to all other editions. The Bipont Literaria Notitia, continued to the present time, is added to each Author.

A full and correct head is given of such authors as could be procured from authentic sources. Maps and illustrative Woodcuts are inserted. There are about 200 in the whole series.

It may be observed, that a set of the Delphin alone sold at the Roxburghe sale, in 1817, for above 5000s., and that a uniform set of the Variorum Classics, in nonpareil type, printed by the same edition now offered would cost many hundred pounds; whereas the present series will cost only 12s. 12s. per annum for 11 or 12 years.

Each Part averages 675 pages. The work cannot be had in separate Authors, but as a whole series. The Authors comprised are—

Cicero, Libri Oratorii, Orationes, Epistolae ad Familiares, Opera Philosophica—Claudianus—Catalinus, Tibullus, Propertius—Eutropius—Horatius—Juvenalis et Persius—Livius—Lucretius—Nepos—Valerius—Phaedrus—Plautus—Plinius—Sallustius—Silius—Statius—Suetonius—Tacitus—Terentius—Valerius—Virgilius—Apollonius—Aulus Gellius—Aurelius Victor—Ammianus—Boethius—Cæsar—Diogenes Crenetius, &c.—Florus, Justinus—Martialis—Martialis—Pamphilus—Pompeius Festus—Prædicator—Quintus Curtius—Valerius Maximus.

* As so few Copies left on hand, as even a voluminous work can never perhaps be reprinted, early applications should be made for the remaining sets. If more convenient, Mr. V. would issue two Nos. monthly, till the set is completed.
No. 141, containing the Dedication, Preface, Subscription List, Engraving of Cicero, may be seen at any Librarian who may be desirous of first ascertaining the nature of the work.
Any persons having incomplete copies are requested to make immediate application for the Numbers wanting, as the price will be raised from time to time on all Numbers in suspense. Names may be sent to Mr. Valpy, Red Lion Court, Fleet Street.

Price Threepence, No. 1. (to be continued Weekly, also in Monthly Parts) of

THE CHRISTIAN'S MAGAZINE; or,

Weekly Miscellany of Religious Essays, Anecdotes,

Literature, Biography, Intelligence, and Poetry.

Contents: Editor's Address—Paraphrase converted from Athelstan, by Moore—Lord Bacon on Atheism—Bibliographical notice of the Golden Legend—Rules of Conduct, by Bishop Middleton—Dr. Adam Clarke on the Populosity of Ancient Cities, &c.—Wickliff's Signs of Preaching, &c.—Extract from a Sermon by J. Bacon the Sculptor—The late W. Ward's (of Norwamp) Account of Human Sacrifices in India—The Frequent and Public Statement of the Evidence of Revelation one of the Methods of contracting Infidelity. Anecdotes: The Praying Negro—Bab-wild, Bishop of Winchester—Luther's Undauntedness—Forgiveness of Treason—Kloof, Bishop of Platola's kindness to a Mob by which he was attacked—Kloof Elizabeth and the Bible—Archbishop Leighton's Christian Liberty to other Sects—Bernard's Custom of Praying for a Blessing while Building a House—Conversion of an Infidel—The Soldier and his Bible. The Premier!!! In 3 vols.

For Majesty's Drawing Rooms.

THE COURT JOURNAL and GAZETTE

of the FASHIONABLE WORLD.

Arrangements have been made which will enable the Proprietors of this popular Journal to present to their readers more copious and interesting particulars, relative to the Drawing Rooms at the Palace of St. James's, than will be found in any other contemporary Journal. In order to afford scope for the complete Picture of the Court of Queen Adelaide, they will on each occasion present their Subscribers with an additional half-sheet, without extra charge. The Dresses, in particular, will form a subject of marked attention.

To prevent disappointment, the Nobility, Gentry, and others, are respectfully recommended to give early orders to the Bookellers and Newsmen, by whom it is regularly forwarded to all parts of the Country, postage free.

Published every Saturday Morning by W. Thomas,

19, Catherine Street, Strand.

No. 18, (to be continued every Two Months, alternately with

the "Gardener's Magazine"), 8s. 6d.

THE MAGAZINE of NATURAL

HISTORY, and Journal of Zoology, Botany, Mineralogy,

Geology, and Meteorology.

Conducted by J. P. W. PHILIP, M.D. F.R.S. L. and E. &c.

Vol. I. and III. may also be had, price 12s. 12s. bound.

Printed for Longman, Rees, Orme, Brown, and Green.

Price 3s.

A TREATISE ON INDIGESTION and

its CONSEQUENCES, called Nervous and Bilious Com-

plaints, with Observations on the Organic Diseases in which they

sometimes terminate.

By J. P. W. PHILIP, M.D. F.R.S. L. and E. &c.

6th edition, with considerable Additions respecting the Nature

and Treatment of the Disease, and particularly of the more pro-

tracted Cases.

London: Printed for T. and G. Underwood, 25, Fleet Street.

Births, Marriages, and Deaths.—Advertisement for Wilson's Foreign and Domestic Directory, 1844.
Edinburgh: and T. Cadell, Strand, London.

Dr. Reid's Practical Chemistry.
In 1 vol. 8vo. with Woodcuts, price 1s.

ELEMENTS OF PRACTICAL CHEMISTRY, comprising a Series of Experiments in every Department of Chemistry, with the Directions for performing them, and for the Preparation and Application of the most important Tests and Reagents.

By **DAVID BOSWELL REID, M.D.**
Experimental Assistant to Professor Hope, Conductor of the Classes of Practical Chemistry in the University of Edinburgh, Lecturer on Chemistry, &c. &c.

Printed for Macleachlan and Stewart, Edinburgh;
and Baldwin and Craddock, London.

Of whom may be had, by the same Author,
Scale of Chemical Equivalents, with Tables
and Letter-press, price 6s.

Speedily will be published,
Elements of Medical Chemistry, by D. B.
 Reid, M.D.

With Woodcuts, 8 vols. post 8vo. 16s.
A YEAR IN SPAIN.
 By a YOUNG AMERICAN.
 "Nothing is easier and more common than to fill a book of travels with erudite information, the after gleaming and gathering of the closet; while nothing is more difficult and rare than to take a year's journey, to study the life and manners of the people, and those groups and characters by the way-side, which place a country and its people immediately before our eyes, and make us the companions of the traveller. We trust that the extracts we have gathered from the original sources, and the notes and comments in no ordinary degree."—*Quarterly Review*, No. LXXXVIII.

The Divine Origin of Christianity, deduced
from some of those Evidences which are not founded on the Au-
thority of Scripture.

LIEUT. COLONEL MATTHEW STEWART'S REMARKS ON THE PRESENT STATE OF AFFAIRS.

The author is, indeed, a pure Whig—but it is on this very account that we are anxious to give his tract whatever additional circulation our testimony may be sufficient to command. He arrives at our conclusion, and he uses arguments which, though not such as our Colonel Stewart, the very able son of a most able father, (the celebrated Professor of Moral Philosophy), is a distant and calm observer of these fierce struggles in the world of politics. This essay will be read to its end by every man who once begins it. It is published by

John Murray, Alderman's Street.

On the 1st March was published, No. II. price 2s. 6d. of

PRICE 8d.

REVIEW OF NEW BOOKS.

Captain Beechey's Narrative of a Voyage to the Pacific and Beering's Strait. 4to. pp. 742. London, 1831. Colburn and Bentley.

THE perusal of this volume throughout has afforded us unmingled pleasure. The story is so well told, and the information is of so interesting a nature, that it is like proceeding along an agreeable path, with something at every turn to stop at and admire. But the more our gratification has been increased, we have felt the more our want of power to do justice to the highly-gifted author's narrative. The more perfect his pictures are, the less do we find ourselves competent to reduce them within our miniature size; the more finished his descriptions, the less will they bear to be broken into insulated fragments. We must, therefore, after all, be satisfied with performing a very imperfect duty towards a volume of very superior excellence.

With his code of instructions in his "locker," our gallant and intelligent Captain sailed from Spithead on the 19th of May, 1825, in the *Blossom*, of twenty-six, but mounting sixteen guns, carefully fitted out for the voyage, and with a complement of 110 persons; the object to meet Captain Parry or Captain Franklin in Beering's Strait, should the naval expedition of the former, or the land expedition of the latter, succeed in reaching that outlet to the Pacific. And as the *Blossom* in her route would traverse a portion of the globe hitherto little examined, her commander was directed to explore and survey these parts, with the view to the furtherance of navigation and general science: the task could not have been intrusted to abler hands.

With such a trip before us, our first tack is to double Cape Horn. Quitting the coast of Chili, the island of Sala-y-Gomez was inspected through the glasses, and the ship bore away for Easter Island.

"As the boats approached, the anxiety of the natives was manifested by shouts, which overpowered the voices of the officers: and our boats, before they gained the beach, were surrounded by hundreds of swimmers, clinging to the gunwale, the stern, and the rudder, until they became unmanageable. They all appeared to be friendly disposed, and none came empty-handed. Bananas, yams, potatoes, sugar-cane, nuts, idols, &c. were offered for sale, and some were even thrown into the boat, leaving their visitors to make what return they chose. Among the swimmers there were a great many females, who were equally or more anxious to get into the boats than the men, and made use of every persuasion to induce the crew to admit them. But to have acceded to their entreaties would have encumbered the party, and subjected them to depredations. As it was, the boats were so weighed down by persons clinging to them, that for personal safety the crew were compelled to have recourse to sticks to keep them off, at which none of the natives took offence, but resigned their position the instant the attention

of the persons in the boat was called to some other object. Just within the gunwale there were many small things which were highly prized by the swimmers; and the boats being brought low in the water by the crowd hanging to them, many of these articles were stolen, notwithstanding the most vigilant attention on the part of the crew, who had no means of recovering them, the marauders darting into the water, and diving the moment they committed a theft. The women were no less active in these piracies than the men; for if they were not the actual plunderers, they procured the opportunity for others, by engrossing the attention of the seamen, by their caresses and ludicrous gestures. In proceeding to the landing-place the boats had to pass a small isolated rock which rose several feet above the water. As many females as could possibly find room crowded upon this eminence, pressing together so closely, that the rock appeared to be a mass of living beings. Of these Nereids three or four would shoot off at a time into the water, and swim with the expertness of fish to the boats to try their influence on their visitors. One of them, a very young girl, and less accustomed to the water than her companions, was taken upon the shoulders of an elderly man, conjectured to be her father, and was, by him, recommended to the attention of one of the officers, who, in compassion, allowed her a seat in his boat. She was young and exceedingly pretty; her features were small and well made, her eyes dark, and her hair black, long, and flowing; her colour, deep brunette. She was tattooed in arches upon the forehead, and, like the greater part of her countrywomen, from the waist downward to the knee in narrow compact blue lines, which at a short distance had the appearance of breeches. Her only covering was a small triangular maro, made of grass and rushes; but this diminutive screen not agreeing with her ideas of propriety in the novel situation in which she found herself, she remedied the defect by unceremoniously appropriating to that use a part of one of the officer's apparel, and then commenced a song not altogether inharmonious. Far from being jealous of her situation, she aided all her countrywomen who aspired to the same seat of honour with herself, by dragging them out of the water by the hair of the head; but, unkind as it might appear to interfere to prevent this, it was necessary to do so, or the boats would have been filled and unmanageable. As our party passed, the assemblage of females on the rock commenced a song, similar to that chanted by the lady in the boat; and accompanied it by extending their arms over their heads, beating their breasts, and performing a variety of gestures, which shewed that our visit was acceptable, at least to that part of the community. When the boats were within a wading distance of the shore, they were closely encompassed by the natives; each bringing something in his hand, however small, and almost every one importuning for an equivalent in return. All those in the water were naked, and only here

and there, on the shore, a thin cloak of the native cloth was to be seen. Some had their faces painted black, some red; others black and white, or red and white, in the ludicrous manner practised by our clowns; and two demon-like monsters were painted entirely black. It is not easy to imagine the picture that was presented by this motley crowd, unrestrained by any authority or consideration for their visitors, all hallooing to the extent of their lungs, and pressing upon the boats with all sorts of grimaces and gestures. It was found impossible to land where it was at first intended: the boats, therefore, rowed a little to the northward, followed by the multitude, and there effected a disembarkation, aided by some of the natives, who helped the party over the rocks with one hand, while they picked their pockets with the other. It was no easy matter to penetrate the dense multitude, and much less practicable to pursue a thief through the labyrinth of figures that thronged around. The articles stolen were consequently as irretrievably lost here, as they were before in the hands of the divers. It is extremely difficult on such occasions to decide which is the best line of conduct to adopt: whether to follow Captain Cook's rigid maxim of never permitting a theft when clearly ascertained to go unpunished; or to act as Perouse did with the inhabitants of Easter Island, and suffer every thing to be stolen without resistance or remonstrance. Perhaps the happy medium of shutting the eyes to those it is not necessary to observe, and punishing severely such as it is imperative to notice, will prove the wisest policy. Among the foremost of the crowd were two men, crowned with pelican's feathers, who, if they were not chiefs, assumed a degree of authority, and with the two demons above mentioned attempted to clear the way by striking at the feet of the mob; careful, however, so to direct their blows, that they should not take effect. Without their assistance, it would have been almost impossible to land: the mob cared very little for threats: a musket presented at them had no effect beyond the moment it was levelled, and was less efficacious than some water thrown upon the bystanders by those persons who wished to forward the views of our party. The gentleman who disembarked first, and from that circumstance probably was considered a person of distinction, was escorted to the top of the bank and seated upon a large block of lava, which was the prescribed limit to the party's advance. An endeavour was then made to form a ring about him; but it was very difficult, on account of the islanders crowding to the place, all in expectation of receiving something. The applicants were impatient, noisy, and urgent: they presented their bags, which they had carefully emptied for the purpose, and signified their desire that they should be filled: they practised every artifice, and stole what they could, in the most careless and open manner: some went even farther, and accompanied their demands by threats. About this time one of the natives, probably a chief, with a cloak and head-dress of

feathers, was observed from the ship hastening from the butts to the landing-place, attended by several persons with short clubs. This hostile appearance, followed by the blowing of the conch-shell, a sound which Cook observes he never knew to portend good, kept our glasses for a while riveted to the spot. To this chief it is supposed, for it was impossible to distinguish amongst the crowd, Mr. Peard made a handsome present, with which he was very well pleased, and no apprehension of hostilities was entertained. It happened, however, that the presents were expended, and this officer was returning to the boat for a fresh supply, when the natives, probably mistaking his intentions, became exceedingly clamorous; and the confusion was further increased by a marine endeavouring to regain his cap, which had been snatched from his head. The natives took advantage of the confusion, and redoubled their endeavours to pilfer, which our party were at last obliged to repel by threats, and sometimes by force. At length they became so audacious, that there was no longer any doubt of their intentions, or that a system of open plunder had commenced; which, with the appearance of clubs and sticks, and the departure of the women, induced Mr. Peard, very judiciously, to order his party into the boats. This seemed to be the signal for an assault. The chief who had received the present, threw a large stone, which struck Mr. Peard forcibly upon the back, and was immediately followed by a shower of missiles which darkened the air. The natives, in the water and about the boats, instantly withdrew to their comrades, who had run behind a bank out of the reach of the muskets; which former experience alone could have taught them to fear, for none had yet been fired by us. The stones, each of which weighed about a pound, fell incredibly thick, and with such precision, that several of the seamen were knocked down under the thwarts of the boat; and every person was more or less wounded, except the female to whom Lieutenant Wainwright had given protection, who, as if aware of the skillfulness of her countrymen, sat unconcerned upon the gunwale, until one of the officers, with more consideration for her safety than she herself possessed, pushed her overboard, and she swam ashore. A blank cartridge was at first fired over the heads of the crowd; but forbearance, which with savages is generally mistaken for cowardice or inability, only augmented their fury. The showers of stones were, if possible, increased; until the personal safety of all, rendered it necessary to resort to severe measures. The chief, still urging the islanders on, very deservedly, and perhaps fortunately, fell a victim to the first shot that was fired in defence. Terrified by this example, the natives kept closer under their bulwark; and though they continued to throw stones, and occasioned considerable difficulty in extricating the boats, their attacks were not so effectual as before, nor sufficient to prevent the embarkation of the crew, all of whom were got on board. Several dangerous contusions were received in the affair; but fortunately no lives were lost on our part: and it was the opinion of the officer commanding the party, that the treacherous chief was the only victim on that of the islanders, though some of the officers thought they observed another man fall. Considering the manner in which the party were surrounded, and the imminent risk to which they were exposed, it is extraordinary that so few of the natives suffered; and the greatest credit is due to the officers and crews of both

boats for their forbearance on the occasion. After this unfortunate and unexpected termination to our interview, I determined upon quitting the island; as nothing of importance was to be gained by remaining, which could be put in competition with the probable loss of lives that might attend an attempt at reconciliation. The disappointment it occasioned was great to us, who had promised ourselves much novelty and enjoyment: but the loss to the public is trifling, as the island has been very well described by Roggewein, Cook, Perouse, Kotzebue, and others; and the people appeared, in all material points, the same now as these authors have painted them."

Captain Beechey attributes the hostile disposition of the natives, and its unfortunate consequences, to the visits of unprincipled masters of trading vessels, whose conduct has been such as to inspire the people with jealousy and hatred.

After visiting Ducie and some other islands, the Blossom arrived at Pitcairn Island. Here old Adams, in his sixty-fifth year, immediately came on board. "He was," we are told, and it is corroborated by an interesting engraving of him, "unusually strong and active for his age, notwithstanding the inconvenience of considerable corpulency. He was dressed in a sailor's shirt and trousers, and a low-crowned hat, which he instinctively held in his hand, until desired to put it on. He still retained his sailor's gait, doffing his hat and smoothing down his bald forehead, whenever he was addressed by the officers. It was the first time he had been on board a ship of war since the mutiny, and his mind naturally reverted to scenes that could not fail to produce a temporary embarrassment, heightened, perhaps, by the familiarity with which he found himself addressed by persons of a class with those whom he had been accustomed to obey. Apprehension for his safety formed no part of his thoughts: he had received too many demonstrations of the good feeling that existed towards him, both on the part of the British government and of individuals, to entertain any alarm on that head; and as every person endeavoured to set his mind at rest, he very soon made himself at home."

Our readers are aware that this remarkable individual is since dead: we have had kindly communicated to us a letter from the island, of the 19th March last; and as the public have felt much curiosity respecting this semi-English settlement, we shall notice its substance.

The writer acknowledges the arrival of tools, clothing, and other articles, by the *Seringapatam*, the Hon. Capt. Waldegrave, and sends the thanks of the islanders to government for these welcome supplies. He then mentions a report that had reached them from Mr. Nott, a missionary, of its being the intention of the Admiralty to send a ship to convey them to Otaheite, or some of the Friendly Islands. This, we had heard, was intended a year or two ago, but we presume the plan has been abandoned; and we rejoice at it, for the writer adds; "the natives are all satisfied at present with their little island, and do not desire to leave it." Adams, he relates, died on the

5th of March, 1829, after a short illness; and his wife survived him but a few months. The writer expresses the gratitude of himself and the rest for the kindness experienced from the Blossom, and for the remembrance of their wants, which led to the shipment in the *Seringapatam*. Since the death of Adams, he and another young man who had stopped there, officiated in the performance of religious duties, and in the instruction of the children. George Adams had married Polly Young, and had two sons; Sarah Christian was the wife of George Nobbs (the young man above alluded to); while Robert and Edward Young, and Mary Christian, were yet unmarried. The inhabitants were all in good health. With this slight episode, we resume our review; and we are sorry we cannot extract Adams's account of the mutiny in the *Bounty*. The description of the natives is also extremely interesting. At Gambier Island the natives were very troublesome and thievish; and Captain B. relates:

"I determined, since the main deck was cleared, that it should be kept so, and placed a marine at each of the ladders; but as the natives tried every method to elude their vigilance, the sentinels had an arduous task to perform; and disturbances must inevitably have arisen in the execution of their orders, had it not been for our Newfoundland dog. It fortunately happened that this animal had taken a dislike to our visitors; and the deck being cleared, he instinctively placed himself at the foot of the ladder, and in conjunction with the little terrier, who did not forget his perilous hug of the day before, most effectually accomplished our wishes. The natives, who had never seen a dog before, were in the greatest terror of them; and Neptune's bark was soon found to be far more efficacious than the point of a sentry's bayonet, and much less likely to lead to serious disturbances. Besides, his activity cleared the whole of the main deck at once, and supplied the place of all the sentinels. The natives applied the name of *boa* to him,—a word which in the Otaheitean language properly signifies a hog. But it may be observed, that *boa* is applied equally to a bull or to a horse, which they call *boa-afae-taata*, (literally, man-carrying pig), or to all foreign quadrupeds." The natives here were also very hostile.

[To be continued.]

but, on the contrary, reasons for wishing to employ his thoughts on subjects foreign to his home, was very anxious to embark in the Blossom; and I would have acceded to his wish, had not his mother kept bitterly at the idea of parting from him, and imposed terms touching his return to the island to which I could not accede. It was a sore disappointment to poor George, whose case forms a striking instance of the rigid manner in which these islanders observe their word. Wives upon Pitcairn's Island, it may be imagined, are very scarce, as the same restrictions with regard to relationship exist as in England. George, in his early days, had fallen in love with Polly Young, a girl a little older than himself; but Polly, probably at that time liking some one else, and being at the age when young ladies' expectations are at the highest, had incautiously said, she never would give her hand to George Adams. He, nevertheless, indulged a hope that she would one day relent; and to this end was unremitting in his endeavours to please her. In this expectation he was not mistaken: his constancy and attentions, and, as he grew into manhood, his handsome form, which George took every opportunity of throwing into the most becoming attitudes before her, softened Polly's heart into a regard for him, and, had nothing passed before, she would willingly have given him her hand. But the vow of her youth was not to be got over, and the loving couple languished on from day to day, victims to the folly of early resolutions. The worthy case was referred for our consideration; and the fears of the party were in some measure relieved by the result, which was, that it would be much better to marry than to continue unhappy, in consequence of a hasty determination made before the judgment was matured; they could not, however, be prevailed on to yield to our decision, and we left them unmarried."

* Captain B., however, says, at the period he was there: "Some books of travels which were left from time to time on the island, and the accounts they had heard of foreign countries from their visitors, has created in the islanders a strong desire to leave it. The idea of passing all their days upon an island only two miles long, without seeing any thing of the world, or what was a stronger argument, without doing any good in it, but with several of them been deeply considered. But family ties, and an ardent affection for each other, and for their native soil, had always interposed to prevent their going away singly. He adds: "George Adams, having no wife to detain him,

Cambrian Superstitions; comprising Ghosts, Omens, Witchcraft, Traditions, &c.; with a concise View of the Manners and Customs of the Principality, &c. By W. Howells. 12mo. pp. 194. Tipton, 1831, Danks; London, Longman and Co.

How dare Mr. Howells attempt to be facetious in a work of this sort? To buffoon a ghost-story, to jest with omens, and to laugh at witchcraft, are unpardonable mistakes in any writer upon these subjects. If he does not seem to be in earnest with them, their whole charm is lost: without a tolerable tincture of superstition no man ought to put pen to paper about corpse-candles, presentiments, fetches, evil days, will-o'-the-wisps, or bogles. Holding this opinion, we could absolutely kick the author for writing in so uncongenial a style as the annexed.

"It is pretty generally known in Carmarthen, that it was the custom (one not quite obsolete, it being revived about a year or so ago) of a spirit to make his or her appearance every night (I presume there are male and female ones), and follow them, to the no small terror of the travellers on the road to St. John's town. She was generally supposed to be a witch, and the place is still styled after her, *Penllan wick*: but one would imagine a witch would not take the trouble to be there so often without some emolument. Be that as it may, it is credited by the illiterate Welsh to have been as true as that St. David is patron saint of Wales, that there *has been* a being haunting that road, to whatever genus he or she may appertain; and it was said re-appeared about a year ago, or thereabouts, probably to see how matters were going on, and to give information of the different marches of improvement, intellect, &c. in the shades below."

Were it not impossible that any book about supernatural things could be dull, we really think this Welsh exposition would have been too poor for review; but as hobgoblins and spectres, wheresoever and howsoever they appear, are worthy of some notice, we shall recall two or three of the best from the narrative before us.

"It was very prevalent in Cambria for people to see the funerals of others going to church previous to their death; and it appears not only by the possessors of the second sight, but also by many others. On one occasion, a countryman was returning home about dusk with his team, near Llanpumpaint, Carmarthenshire, when he met one of these ghostly funerals, and, what appears rather singular, the fore-horse was startled at sight of the procession; in about a week after this, the funeral of a person who died suddenly at a farm near there passed that way, and the same man happening to see it, declared the incorporeal and substantial funerals were precisely alike in every respect. Another circumstance in vogue is of a young man of Trelech, Carmarthenshire, who, returning home about 'the hour when spirits roam' from visiting his *cariad*, also met one of these spectral burials, and possessing a considerable share of courage, followed it after it passed him, in order to see what would occur. He had not proceeded far, ere he observed one of the company turn aside to accost a friendly ghost who seemed passing by, with 'Well, how, *mau yr ych chwi oachgen?*' (how d'ye do, my friend?) In a few days after, a funeral passed by that way, and that he might ascertain whether such things were, the man followed, and confidently asserted to many that the circumstance of the man being accosted actually took place.

About thirty years ago, there was a rumour which many of the old inhabitants of Carmarthen may recollect, of the singular appearance of three of these funerals at noon, near Cwmdyran, when several people were reaping in a field not far distant, and one observing them, called out to the rest, when all, to the number of about twelve, beheld them for a considerable time moving along. In the course of the week three deaths occurred, and the three funerals passed the way where their forerunners were seen, at the same time. These are a sort of processions that I never heard took place any where but in Wales. An old man residing near Llanilwch church, Carmarthenshire, has taken his oath that he often saw these kind of funerals going to church; and one evening he had the curiosity to notice one, by peeping over the wall. Most of the people in the procession he knew, but perceived some one, whom he imagined a stranger, standing apart from the rest, and gazing at them. In a few days after this there was a real funeral, so that he determined to see whether there would be any similarity between them, and went to the church-yard, but unconsciously stood on the very place where he saw the supposed stranger gazing, which, it appears, was no other than his own ghost. This man, I am informed, was favoured with the second sight, so that his seeing such things seems not improbable; but as to others not possessed of the gift, it is absurd for a moment to hesitate that they saw them. * * *

"In some parts of North Wales a voice has been heard when the husband of a house has been quitting for immortality, saying, '*Y mae nenbren y ty yn craccio, se dyr yn y maen*,' which implies that the main beam which supports the house is cracking, and will soon fall; and, just as he was expiring, it would say, '*Dyna se yn torri*,' or 'there it breaks.' A strange chirping of chickens has been also heard as people were dying, and I am acquainted with one aged person who has heard it. It is related, too, that as one Rees, a religious man, residing near Carmarthen, was leaving this world, those who were in the room heard some sweet singing, as if of angels. The following remarkable occurrence I cannot refrain from narrating, as the family in which it occurred, who now reside at Carmarthen, were far from being superstitious: their seeing this will recall it to memory. As they were seated in the parlour, with an invalid lying very ill on the sofa, they were much surprised at the appearance of a bird, similar in size and colour to a blackbird, which hopped into the room, went up to the female who was unwell, and, after pecking on the sofa, strutted out immediately. What appears very strange, a day or two after this the sick person died. A bird of the same kind flew to a window, as if it wished to enter the room in which a person lay ill, at Penygraig, and although they endeavoured to frighten it away several times, it would not go. That night the man departed this life."

But the following is of a character quite as peculiar as the chickens chirping, by way of death-tick:

"There stood formerly near Brecon a chapel, called Elnyfed chapel, concerning which the legendary account states, that on one of the saint's days being kept there, after the conclusion of service the people were seized with a sort of lunacy, making motions with their hands and feet of whatever works they had unrighteously performed on other saints' days, so that some were making signs of leaping, some of plaiting, some of spinning, others of combing flax or knitting stockings, &c.; but

after they had made offerings before the altar, and begged forgiveness of the saints, they were restored to their senses."

This reminds us of the oriental fable of the Palace of Truth. If people were enforced to exhibit all their misdoings with true pantomimic accuracy at any given time and place, we rather suspect that a number of odd matters would come to light. At any rate the scene would be wondrous droll, though we are not prepared to say that the consequences would be always very agreeable. An *Elnyfed* chapel is not a church, the "*spread*" of which over the country is to be coveted. But we pass to the author's account of the good people.

"The following (he says) is the account related in Wales of the origin of the fairies, and was told me by an individual from Anglesea. In our Saviour's time there lived a woman whose fortune it was to be possessed of near a score of children, (what would the Malthusians now-a-days say to such a living stock?), and as she saw our blessed Lord approach her dwelling, being ashamed of being so prolific, and that he might not see them all, she concealed about half of them closely, and, after his departure, when she went in search of them, to her surprise found they were all gone. They never afterwards could be discovered, for it was supposed that as a punishment from heaven, for hiding what God had given her, she was deprived of them; and, it is said, these, her offspring, have generated the race of beings called fairies. In some parts of Pembrokeshire and Carmarthenshire, we have some singular accounts of islands inhabited by fairies, who attended regularly the markets at Milford Haven and Laugharne, bought in silence their meat and other necessaries, and leaving the money, (generally silver pennies,) departed, as if knowing what they would have been charged. They sometimes were visible, and at other times invisible. The islands, which appeared to be beautifully and tastefully arranged, were seen at a distance from land, and supposed to be numerous peopled by an unknown race of beings. It was also imagined that they had a subterraneous passage from these islands to the towns. It is reported, they were particularly fond of purchasing their meat from one butcher, to whom they often came invisible, and after taking the meat, deposited the proper payment."

"An aged individual from Anglesea, solemnly affirmed to me, that when a youth, he frequently saw the Tylwyth Teg; and that going out early one morning to fetch his father's cows from the field, he observed a *posse* of the little folks dancing: he says, that when beholding them, his eyes became dazzled, as if he was looking upon the sun, and on his return from the meadow, he discovered a groat placed on a stone of Cymmuned Bridge, and always after he had seen them, found the same sum placed there. His having money so often about him, excited his father's suspicion, and one Sabbath day he inquired the manner in which it was obtained, when he confessed that it was through the medium of the fairies. He often went after this to the field, but never found any money on the bridge, or saw the offended Tylwyth Teg again; for through his divulging the secret, their favour and kindness were lost. The same person also informed me, that in the neighbourhood where he lived, a person one day arising to labour, was much surprised at not being able to find his shirt, and next morning much more so at beholding a fairy bounce in the room and disappear instantly: getting up soon after this, he was agreeably

astonished at discovering his shirt washed clean, with half a crown enclosed in it, for which he was indebted to the little beings. At Llandrwgan, in the same county, a woman had twins, to which the fairies took a fancy and bore away, substituting two of their own children in the cradle in lieu of them; but the resemblance between them being so great, the woman never discovered the trick until several months had elapsed, when not perceiving the children grow, she imagined that something was wrong, and accordingly took them to Gwr Cyvarwydd, or village oracle, who told her to procure an egg-shell, and having filled it with wort and hops, to lay it in the way of the little folks, and particularly to observe what they said respecting it. She acted conformably to his advice; and when the fairies beheld the egg-shells, seeming much astonished, one of them exclaimed,—"I can remember yon oak an acorn, but I never saw in my life people brewing in an egg-shell before." Upon hearing this, the woman became infuriated,—her Cambrian blood was roused, and seizing a whip that was near, she began to let the surprised fairies taste it; but the old ones, hearing the cries of their offspring, interfered, and the next day the woman was much gratified and pleased at seeing her real babes again."

With this extract we conclude; and have only to add, that the style is in general faulty, and that sad havoc is made with scraps of foreign languages. Where did the author discover, page 8, that the Druids, or their proselytes, worshipped their *demlan maen*, or stone temples; or where did he find, page 62, that *caro sposo* was the Italian plural for sweet-hearts? We are sorry to see this foolish affectation diffusing itself beyond the region of trashy novels.

The Family Library; Vol. XX. Sketches of Venetian History; Vol. I. London, 1831. Murray.

PICTURESQUE records from one of history's most picturesque records. Never was city more rich in romantic association, and never were romantic associations more fortunate in being chosen for themes whereon "the mighty of the mind poured forth their spirit." And yet, while the name of Venice has been familiar to us as a "household word," a connected English history has hitherto been wanting.* This want is now well supplied—these *Sketches of Venetian History* are written with equal animation and elegance. The author seems to have entered *con amore* into his subject, and brought to his performance that best industry—vivid interest in the pursuit to which it is directed. Full of curious and little-known anecdotes, we cannot do better than make a brief selection. The reception of St. Mark at Venice is better known than his after adventures.

"Notwithstanding the splendour of his reception, and the many subsequent testimonies of high honour which he received, the saint occasionally proved capricious, and did not always deign to shew himself even to his most illustrious visitors. Two centuries after the above translation (1094), when the Emperor Henry III. made an express pilgrimage to his shrine, the body had very petulantly disappeared. The priests had recourse to prayer and fasting for its recovery, and the whole capital was engaged in tears, abstinence, and supplication. At length the saint relented. One morning the sacristan whose turn it was

to attend the church in which the body *ought* to have been found, perceived, on entering, a fragrant odour and a brilliant light which issued from a particular column. The simple priest imagined that there was a fire, and ran up in affright to extinguish it; nor was his alarm diminished when he saw a human arm protruding from the column. He hastened to the doge and announced this marvel, and the Bishop of Olivolo and the other clergy, having been summoned, repaired with profound devotion to the church. There, as they knelt before the pillar, the arm dropped a ring from one of the fingers of its hand into the bishop's bosom; and at the same time the column opened and displayed an iron coffin enclosing the remains of the evangelist. The holy corpse wrought numerous miracles; and a feast was instituted to commemorate its invention. On each 24th of July, while the *magnificat* was being chanted, the congregation was sprinkled with rose-water, in memory of the sweet odour, and two tapers were lighted before the pillar. Among the other relics which on this occasion were borne abroad in splendid procession, was an autograph of his gospel from the evangelist's own pen, in which, unhappily, learned men are undetermined whether the character is Greek or Latin, and whether the material is paper or parchment. The ring was sacrilegiously stolen, in the year 1585, and, perhaps, the body has undergone a similar fate. Having been placed in a receptacle more worthy of it, the secret of which was intrusted to none save the doge, and the provveditori—officers especially appointed for the saint's guardianship—a magnificent church was decreed and built over this mysterious tomb. Yet a modern traveller, who was by no means likely to approach this legend with an eye of scepticism, roundly taxes Carosio, who, about twenty years afterwards, for a short time usurped the throne, with a *private sale* of the relic. 'Since his time,' says Eustace, 'the existence of the body of St. Mark has never been publicly ascertained. The place, however, where the sacred deposit lies, is acknowledged to be an *undivulged secret*; or, perhaps, in less cautious language, to be utterly unknown.'"

Venetian luxury:—"The chroniclers have presented an amusing picture of the luxurious habits of the Constantinopolitan fair one, who shared the crown of Dominico Silvio, a later doge. Such, we are assured, was the extent of her refinement—*adeo morosa fuit elegantia*—that she banished the use of plain water from her toilet, and washed herself only with the richest and most fragrant medicated preparations. Her apartments were so saturated with perfumes, that those who were unaccustomed to such odours often fainted upon entering; and as the climax of sinful indulgence (for such it appears to the narrator) in the inordinate pride of her evil heart, she refused to employ her fingers in eating, and never touched her meat unless with a golden fork. Her end was in miserable contrast with these Sybaritic manners. She was stricken with a sore disease, considered, no doubt, as an especial judgment; and her sufferings, which were long protracted, were of such a nature, as to excite rather the disgust than the pity of her attendants."

Heroism displayed at the siege of Tyre:—"The troops investing the city by land murmured at their unremitted hardships; and, contrasting their own daily perils and labours with the ease and security of those who were engaged in the blockade by sea, looked with an evil and suspicious eye upon their Venetian allies. This danger was observed, encour-

tered, and remedied by the promptitude of Michieli; and history presents few specimens of more chivalrous self-abandonment than that upon which he resolved. Stripping the entire fleet of its equipments, he ordered the rowage, masts, sails, and rudders to be borne with him to the camp. 'These,' he said, pointing to the burdens of his attendants, 'are the pledges of our fidelity and of our participation in dangers which ought to be common to all. We can no longer have it even in our power, if it could be supposed to be in our will, to quit the walls, and the slightest gale will expose us to far greater peril than that of mortal combat!' This substantial proof of sincerity, and the politic advance at the same time of one hundred thousand ducats for the payment of the soldiers, restored confidence at once among the allies. A general voice deprecated the useless exposure to danger which the Venetians proffered; and all hands assisted in refitting the fleet, the active services of which might soon be demanded."

Incident at the siege of Ancona:—"A woman of Ancona, heart-broken by the exhaustion of her two sons, and hopeless of other relief, opened a vein in her left arm; and having prepared and disguised the blood which flowed from it with spices and condiments (for these luxuries still abounded, as if to mock the cravings of that hunger which had slight need of any further stimulant than its own sad necessity), presented them with the beverage—thus prolonging the existence of her children, like the bird of which similar tenderness is fabled, even at the price of that tide of life by which her own was supported."

The belief in omens and prophecies was universal in that age. Mountzouphlus was forced to fly from Constantinople when it was taken by Baldwin.

"Having in vain attempted to rally his adherents, he took refuge in the fastnesses of Thrace, after escaping through the Golden Gate. That gate had been closed for two hundred years; and it bore engraven on it, an inscription, long beforehand regarded as prophetic, and afterwards believed to have been fulfilled in this flight of the emperor. 'When the fair-haired King of the West shall come, I shall open of myself!' Another prediction had ensured the city from capture, unless through an angel; and we are informed by an authority not remote from these times, that the rumour of the Latin conquest was disbelieved, for many days, in the surrounding country, until it was ascertained that the walls had been scaled at a spot on which an angel was painted."

Romantic legends, founded on Baldwin's fate:—"The sad fate of the first sovereign of Constantinople requires some brief notice. The release of Baldwin was demanded from Joannice by Pope Innocent; and the barbarian contented himself by replying that his illustrious captive had died in prison. More than one version of his catastrophe has been given; and each abounds in horror. Nicetas states that, after long confinement, the Bulgarian cut off his arms and legs, and exposed him to wild beasts. Acropolita adds, that his skull, set in gold, was used by the tyrant as a goblet. A yet more romantic tale attributes the Bulgarian's vengeance to jealousy, excited by his queen, who, becoming enamoured of the prisoner, offered him herself and freedom as the price of his love. The examples of Bellerophon and Hippolitus were unknown or unregarded by the disdainful Baldwin; and the disappointed fair, incensed at his cold rejection, falsely

* Daru's delightful work would, we think, well repay an English translation, general as is its popularity in the original.—Ed. L. G.

denounced him to her husband, who, in a paroxysm of fury, heightened by intoxication, slew him and cast his body to the dogs. The circumstances attendant upon his death, no doubt, are obscure; but the fact itself is supported by strong evidence—it was accredited, though far from hastily, by the barons; and it is not easy to assign any reason why Joannice should assert it if it had been untrue. Nevertheless, at the expiration of twenty years, when the sovereignty of Flanders and Hainault had devolved on Jean, the eldest daughter of the supposed deceased prince, a claimant appeared, asserting his identity with the lost Baldwin. He maintained, that after his capture at Adrianople, he had been mildly treated by his conquerors, till, having effected his escape from them, he fell into the hands of another tribe of barbarians, to whom his rank was unknown, and who sold him as a slave into Syria. There accident enabled him to discover himself to some German merchants, who ransomed him at a small price; and as the throne of Constantinople, by the death of his brother, had then passed into another line, the recovery of his hereditary dominions appeared to him an easier attempt than that of his eastern rights. The populace, ever credulous of wonders and open-eared to novelty, eagerly devoured this tale, which gained admission among several even of the nobler Flemings. It was rejected altogether by the reigning countess; who, finding herself endangered by the pretender, claimed and received protection from Louis VIII. of France. The king in person examined the nominal emperor; and, though convinced of his imposture, in consideration of a safe-conduct which he had previously granted, contented himself by ordering him to quit his dominions. Detected in his fraud and abandoned by his former adherents, the pseudo-Baldwin, nevertheless, renewed his projects; till, having been betrayed into the hands of the countess, he is said to have confessed, under torture, that he was a Champagner, named Bertrand de Rayns. He was exhibited awhile to public scorn in the chief towns of the Netherlands, and then ignominiously hanged at Lille. Little doubt can exist of the justice of his fate; yet such is the fondness of the human mind for mystery, so pertinaciously, in despite of truth, does it cling to the marvellous, that there have not been wanting writers who prefer to believe the Countess Jean guilty of an atrocious parricide, rather than to admit that an adroit knave practised a daring but not very difficult imposture."

What a magnificent subject of debate is the following!—

"If we may believe the MS. chronicles of Barbaro and Savina, a project of general emigration to the East was at one time contemplated. Ziani is said, during the troubled reign of the second Courtenay, to have convoked the great council and all the chief functionaries of state; and, after pointing out the precarious condition of the empire under its existing feeble and divided rulers, to have proposed the abandonment of Venice, and the transfer of her whole population to Constantinople. The brilliant prospects which he displayed as likely to result from this important change dazzled many in the assembly; and it is added that, notwithstanding an eloquent and impassioned appeal to their affections and their patriotism, by the Procuratore Angelo Faliero, the proposal was negatived, in the division which ensued, but by a single voice, which was not unaptly termed 'the voice of Providence.' How wide a field of speculation does this now scarcely remembered

incident open to our view! What changes in the history of mankind might not the adoption of Ziani's project have occasioned! Would the existence of the Latin empire have been protracted by it? Would the conquests of the Turks have been diverted into another channel? Would Christianity, instead of Mohammedanism, have been the dominant religion of the East? Compared with these far mightier questions, the fate of Venice herself is disregarded; and we almost forget to inquire what would have been the fortunes of her deserted islands."

We like the author's own remarks in our next.

"Of the six emperors who had struggled through the half century which succeeded the conquest of Constantinople, the second Baldwin was by far the least qualified to encounter the perils which surrounded him. He had thrice made the circuit of Europe as a suppliant for assistance, and he now returned to his eastern capital impoverished and dishonoured. It is unnecessary to speak of the countless sordid littlenesses to which poverty reduced him; but there are two facts partially connected with the history of Venice too remarkable to be omitted. Philip, a son of this last Latin emperor of Constantinople, was pawned by his father to some burghers of his capital, as the only security which they would accept for a loan incommensurate with the pledge; and the prince was transferred by them to the custody of some Venetian merchants, for greater safety. To other monied usurers of Venice was intrusted a deposit, which, whatever in our present estimation may be its genuineness and intrinsic value, was considered, at the time of which we are writing, as beyond all price. The frequency of imposture has, no doubt, attached much both of ridicule and suspicion to the generality of relics; and the silly pretensions to miraculous virtue which have been asserted for them, have increased these unfavourable impressions. But I know not why those vivid emotions, that glow of affection, that veneration and love, with which we contemplate other monuments of wisdom and of virtue, should be repressed and chilled when we turn to like memorials of our faith. If the reputed crown of thorns was really that borne by our Lord during his sufferings, or (what in the present instance is the same thing) was really *believed* to be such, the piety which coveted its possession demands not our sarcasm, but our respect. On the credit of this treasure, a sum, amounting to about 7000*l.* of our money, had been borrowed by the empire: the time stipulated for its redemption approached; and, if not redeemed, its property would become absolutely vested in Querini, a Venetian who had advanced the loan. Louis of France, who has been canonised for his devotion, profited by the opportunity, and, after an agreement with Baldwin, discharged the debt, and conveyed the relic to Paris. The Sainte Chapelle was built and consecrated for its reception. It was jealously guarded, and magnificently enshrined; and, after the lapse of four centuries, on one of those occasions by which, as a corrective to human pride, the weakness of the good and the follies of the wise are permitted to exhibit themselves in strong light, by being produced as a voucher for enthusiasm it excited the surprise and curiosity, the credulity or the scepticism, of all the Christian world."

The ensuing anecdote is very characteristic of the times; but we must observe, it was the obvious policy of rulers to lead the people

to suppose themselves under the immediate protection of Heaven.

"It must be borne in mind that the legend which we are about to produce is recorded by more than one authentic chronicler, and that it was sufficiently believed to give birth to a public religious ceremony. In the year 1341, an inundation, of many days' continuance, had raised the water three cubits higher than it had ever before been seen in Venice; and during a stormy night, while the flood appeared to be still increasing, a poor old fisherman sought what refuge he could find, by mooring his crazy bark close to the Riva di San Marco. The storm was yet raging, when a person approached, and offered him a good fare if he would but ferry him over to San Giorgio Maggiore. 'Who,' said the fisherman, 'can reach San Giorgio on such a night as this? Heaven forbid that I should try!' But as the stranger earnestly persisted in his request, and promised to guard him from harm, he at last consented. The passenger landed; and having desired the boatman to wait a little, returned with a companion, and ordered him to row to San Nicolo di Lido. The astonished fisherman again refused, till he was prevailed upon by a further confident assurance of safety, and excellent pay. At San Nicolo they picked up a third person, and then instructed the boatman to proceed to the Two Castles at Lido. Though the waves ran fearfully high, the old man, by this time, had become accustomed to them; and, moreover, there was something about his mysterious crew which either silenced his fears, or diverted them from the tempest to his companions. Scarcely had they gained the strait, when they saw a galley, rather flying than sailing along the Adriatic, manned (if we may so say) with devils, who seemed hurrying, with fierce and threatening gestures, to sink Venice in the deep. The sea, which had hitherto been furiously agitated, in a moment became unruffled; and the strangers, crossing themselves, conjured the fiends to depart. At the word, the demoniacal galley vanished, and the three passengers were quietly landed at the spots at which each respectively had been taken up. The boatman, it seems, was not quite easy about his fare, and, before parting, he implied pretty clearly that the sight of this miracle, after all, would be but bad pay. 'You are right, my friend,' said the first passenger; 'go to the doge and the procuratori, and assure them that, but for us three, Venice would have been drowned. I am St. Mark; my two comrades are St. George and St. Nicolas. Desire the magistrates to pay you; and add, that all this trouble has arisen from a schoolmaster at San Felice, who first bargained with the devil for his soul, and then hanged himself in despair.' The fisherman, who seems to have had all his wits about him, answered that he might tell that story, but he much doubted whether he should be believed: upon which St. Mark pulled from his finger a gold ring, worth about five ducats, saying, 'Shew them this ring, and bid them look for it in my treasury, whence it will be found missing.' On the morrow the fisherman did as he was told. The ring was discovered to be absent from its usual custody, and the fortunate boatman not only received his fare, but an annual pension to boot. Moreover, a solemn procession and thanksgiving were appointed, in gratitude to the three holy corpses which had rescued from such calamity the land affording them burial."

Enthusiasm of the Venetians during the war with Genoa.

"Where age or infirmity rendered personal

service impossible, entire fortunes were surrendered to the state; vast debts were remitted by creditors; plate, jewels, and treasure, were heaped into the public coffers; the doge mortgaged his revenues; the ecclesiastics bore arms. One holy band alone was found wanting to its country, and the Minorites excused themselves. It was written, they said, in their statutes, that no one of their brotherhood, whatever might be the occasion, should handle any weapon of offence. Their cowardly hypocrisy received its deserts, and they were banished from the Dogado. Among the traders, we hear of a furrier who undertook the maintenance of one thousand armed men; of an apothecary who equipped a galley; of plain mechanics and simple artisans who associated to defray similar expenses. One, perhaps, of the most touching offers which this great crisis called forth, was that made by Matteo Faseolo, a townsman of Chiozza, whom its loss had reduced from opulence to beggary. Carrying with him his two sons, he presented them to the magistrates. 'If my estate,' he said, 'were such as I once possessed, all of it should be contributed to the public exigencies; but life is now the only property which is left to me and to these. Dispose of it as you think best. Employ us either by land or sea, and gladden us by a consciousness that what little we still retain is devoted to our country.'

We regret not having room for the sketch of the heroic Pisani; but his ought to be a full-length. This portion brings the narrative down to the execution of the last princes of the house of Carrara. We recommend this most varied and interesting volume warmly: few of its companions, if any, have better claims on public favour.

Dignities, Feudal and Parliamentary, and the Constitutional Legislature of the United Kingdom. By Sir William Betham, Ulster King of Arms, &c. Vol. I. 8vo. London, 1830. Boone.

HEROES and heroines of romance! ye who, seated on imagination's throne, have basked in the sunshine of popular favour, look not down from your airy height with too much self-confidence. The march of revolution and reform may proceed with rapid strides along the shelves of the Ebers's, the Hookhams, the Andrews, and the Saunders and Otleys; and ye may be hurled to the dust, or, as the old poet has it,

"In a trice
Condemned to Hoods to make up spice."

We raise our warning voice to awake you to the consciousness of your danger, and we have done our duty! In this revolutionary age we should not be surprised if the grave antiquarian and heraldic Sir William Betham were to rival Sir Walter Scott in circulating-library popularity.

However, seriously speaking, it is not improbable, in these days of inquiry into constitutions, and clamour about parliamentary reform, that Sir William Betham's valuable work (the second and concluding volume of which is to be published at the end of the year) will obtain a circulation far beyond that for which it was evidently intended.

The subject, and the character of the author, make these volumes essential for the library of the statesman, the lawyer, the scholar, and the gentleman; but (we of course speak judging from the contents of the volume before us) as they will contain the very spirit of our history, an account of the origin and progress of our "free and glorious constitution," it behoves all, (for every one is now a politician), care-

fully to study this important and well-timed documentary history.

From works of a comprehensive nature, it is very difficult to select fair and characteristic extracts, and to quote garbled passages is at once an injustice to the author and the subject. We, therefore, of necessity, prefer, as most suitable to our columns, such portions as we can most easily insulate, although affording slight illustrations of Sir William Betham's researches, or of the nature of his work. We prefer too taking the Ulster King of Arms upon his own ground, Ireland; ground which, if he relax not in his meritorious exertions, he is likely to keep with honour. Who but will admire the gallant bearing and courteous demeanor in which he tilts at the *Fœdera*? And prithee, gentle reader, mark the demeanour, in contrast to that which has been recently exhibited. Let the trumpets sound, and Sir William Betham stand forth.

Thus saith Sir William—"Neither can a good reason be discovered why, in the printed *Fœdera*, a majority of the entries on the early rolls in the Tower, particularly those respecting Ireland, are omitted. Many Irish articles are inserted, otherwise we might suppose it had been intended to form a series of volumes respecting Ireland especially and particularly, which would have been an object well worthy the consideration of the record commissioners; but as the case now stands, it would be better to print, in supplemental volumes, *all the omitted entries*, whatever may be their subject matter, as they are of fully equal value and interest with those printed. This has been demonstrated by Mr. Bayley, the able and intelligent deputy-keeper of the records in the Tower, who printed the omissions in the sixth year of John; and they alone amount to nine pages of folio. The latter volumes are more complete, and the principle of exclusion of Irish documents has not been carried to such an extent, but many are omitted. Why should there be any omissions? Every state paper, charter, or letter, has its historical interest and value, and the *Fœdera* is imperfect and comparatively useless without the complete body of documents. They consist, in part, of instructions to officers, charges against them, and their defences: in such cases, it is not sufficient to give one or two articles of a series as a specimen, the whole ought to appear; examples of what the records consist are not wanted; as evidence and materials of history, they are alone valuable, and one may say, in that respect, they are inestimable. When we consider the character, learning, and liberality of the individuals, under whose control, direction, and management, the new *Fœdera* is now compiled, it is, indeed, difficult to account for the omission of those important articles; and it is much to be regretted, as motives of national hostility, contempt, and jealousy, are always ascribed by a sensitive people, when no other national or sufficient cause can be ascribed for so extraordinary an omission."

We proceed to extract a curious passage respecting Irish law students in England:—

"The parliaments of Ireland, held in the 9th of Henry V. and the 7th of Henry VI. made representations to those kings; among other grievances of the hindrances which Irish students of the law met with at the inns of court in London, when they went there to study, in which the unity of practice of the laws in both countries is set forth. These statements are given hereafter in full, from the close rolls; but the passages referring to the students at law are here inserted. That of 9

Henry V. is in the Norman-French language; of which the following is a translation. '*Item*,—Your said lieges shew, that whereas they are ruled and governed by your laws, used in your realm of England, to acquire the knowledge of which laws, and to be well informed therein, your lieges have sent able persons of English blood, born in your said land, to certain inns of court,* where, from the time of the conquest of your said land, they have ever been received, until lately, that the governors and company of the said inns have refused, and would not receive the said persons into the said inns, as they had been accustomed to do. Therefore, may it please your most gracious lordship, to consider this matter and ordain due remedy; that your laws may continue, and not be forgotten in your said land.'

Upon this, and the representation made in the reign of Henry VI., Sir William Betham proceeds to offer the following interesting observations on the government of Ireland,—a subject at all times of importance, but never before the present, a political point to which the whole gaze of Europe is anxiously directed.

"Special care seems at all times to have been taken to preserve the uniformity of the Irish and English law; no change could have taken place in the former, but what, from time to time, had been made in England; and the early judges were mostly Englishmen, sent over to administer the English law in its purity. The viceroys were also English, or, what might be considered the same thing, Irish noblemen, in possession of large estates in England, as the Earls of Ormond, &c. &c. They generally held the sword but a very few years: from the year 1173 to 1200, there were no fewer than seventeen chief governors; in the thirteenth century, forty-six; in the fourteenth, ninety-three; in the fifteenth, eighty-five; in the sixteenth, seventy-six; in the seventeenth, seventy-nine; in the eighteenth, ninety-four! All were, naturally, attached to the English laws and customs, but held the viceroyship for so short a time—on an average not more than two years—that none were long enough in Ireland to form laws or customs in accordance with their own notions. The customs of the *mere Irish* were indeed different; but they had no influence on the administration of the laws. Where the Irish had power, they superseded the English law altogether, and introduced the Brehon, or Irish law; but where there was English rule, there was English law. The viceroys and the judges knew no laws or customs but those of England; and when that was the case, no arbitrary variations could have occurred in the administration of the English law in Ireland."

We need not extend our extracts to shew the value of Sir William Betham's work, in a historical point of view. It is one of the few publications of the present day which will be quoted and referred to as an authority.

The Life of Fuseli.

(Second Notice.)

IN our very brief introductory notice of this publication, we mentioned a series of aphorisms, chiefly relative to the Fine Arts, as forming a component part of the second volume. To these pithy saws of the late eminent artist we shall confine this paper: some of them are striking, and most of them replete with high and intellectual ideas. How true is the following!

* *Hôtels de Courte.*

† *Rot. Claus. Hib. 9 Hen. V.*

"Some enter the gates of art with golden keys, and take their seats with dignity among the demi-gods of fame; some burst the doors and leap into a niche with savage power; thousands consume their time in chinking useless keys, and aiming feeble pushes against the inexorable doors."

And again:—

"He who pretends to have sacrificed genius to the pursuits of interest or fashion; and he who wants to persuade you he has indisputable titles to a crown, but chooses to wave them for the emoluments of a partnership in trade, deserve equal belief."

"Distinguish between genius and singularity of character; an artist of mediocrity may be an odd man: let the nature of works be your guide."

"Know that nothing is trifling in the hand of genius, and that importance itself becomes a bauble in that of mediocrity:—the shepherd's staff of Paris would have been an engine of death in the grasp of Achilles; the ash of Peleus could only have dropped from the effeminate fingers of the curled archer."

"Genius may adopt, but never steals."

"All mediocrity pretends."

"Sensibility is the mother of sympathy. How can he paint Beauty, who has not throbbled at her charms? How shall he fill the eye with the dew of humanity, whose own never shed a tear for others? How can he form a mouth to threaten or command, who licks the hereditary spittle of princes?"

The annexed is quite as applicable to literature as the arts;—we should suspect rather more so.

"If you wish to give consequence to your inferiors, answer their attacks.—*Coroll.* Michael Angelo, advised to resent the insolence of some obscure upstart who was pushing forward to notice by declaring himself his rival, answered—'Chi combatte con dappochi, non vince a nulla: ' who contends with the base, loses with all!'"

"We do not so entirely agree with the next.

"Genius knows no partner. All partnership is deleterious to poetry and art:—one must rule."

Perhaps, however, such exceptions as Beaumont and Fletcher only prove the general accuracy of the remark.

We like the discrimination of the subjoined.

"Art among a religious race produces relics; among a military one, trophies; among a commercial one, articles of trade."

"Modern art, reared by superstition in Italy, taught to dance in France, plumed up to unwieldiness in Flanders, reduced to 'chronicle small beer' in Holland, became a rich old woman by 'suckling fools' in England."

The next is a pretty thought: "The colours of pleasure and love are hues."

It is curious to read the following at a period when the subject has had so remarkable a commentary in the actual state of things.

"The invention of machines to supersede manual labour will at length destroy population and commerce; and the methods contrived to shorten the apprenticeship of artists, annihilate art."

The ensuing is a palpable hit at hypocrisy:—"Expect no religion in times when it is easier to meet with a saint than a man; and no art in those that multiply their artists beyond their labours."

"Sinceret se plebeculam pascere," said Vespasian to the artist who had contrived a machine to convey some large columns with a trifling expense to the capitol, and rewarded him without accepting his offer."

The next we recommend to all the artists, authors, &c. who come under the remarks of the *Literary Gazette*.

"Modesty.—The touchstone of genuine modesty is the attention paid to criticism, and the temper with which it is received, or its advice adopted; the most arrogant pretence, the most fiery ambition, the most towering conceit, may fence themselves with smoothness, silence, and submissive looks. Oil, the smoothest of substances, swims on all."

As a contrast:—"Vanity. The vain is the most humble of mortals:—the victim of a pimple."

And with this we must, for the present, take our leave of the sagacious dicta of Mr. Fuseli.

Observations on the Registration Bill, addressed to the Commissioners on the Law of Real Property. By George Bentham, Esq. London, 1831.

His Majesty's commissioners on the law of real property have prepared a bill, which is now pending before parliament, for establishing a register for all deeds relating to land.* It is considered, we believe, by all competent judges, that this bill embodies a very ingenious and simple plan, and that it is framed with a degree of skill and care by no means common.

It seems, however, that Mr. George Bentham is the possessor and the intended editor of a treatise by his uncle, Mr. Jeremy Bentham, on *Nomography*. It seems that the undisclosed doctrines of my uncle are not implicitly followed in the commissioners' bill; the nephew and editor elect, therefore, sallies forth with a pamphlet, abusing the bill, and substituting one of his own, more conformable "aux idées de mon oncle."

We have not been able to ascertain that any one, except ourselves, has read Mr. B.'s pamphlet, and we have no reason to believe that any one else ever will: Mr. Bentham will, therefore, please to consider that the trouble we take in this matter is designed solely for his benefit. His publication assumes that he is qualified to instruct the commissioners: we do not think that we are qualified to instruct those gentlemen; but if we do not shew that we are better entitled to instruct him than he is to instruct them, we admit that he is not the most impudent man in England.

Adverting to the fact, that the pamphleteer comes forward as the champion of his uncle's MS. doctrines, and the censor of all contraveners, we are naturally led to think of the memorable *Défense de mon Oncle* by the nephew of M. l'Abbé Barin. The points of resemblance between the venerable relative of the pamphleteer and the abbé are numerous and striking. The nephew of M. Barin expressly says, "mon oncle savait parfaitement l'Arabe et le Copte." Now it is well known that some of the later works of Mr. Jeremy Bentham are written in some language which is not English: it has never been made out to be any other known tongue, and we have failed in ascertaining that it was not Coptic or Arabic, or both. From these premises, we conclude that the strange words which have puzzled the world are, in fact, Coptic or Arabic. Surely this fact argues a strong similarity in the genius of the two uncles.

Then M. l'Abbé, as we know on the same authority, "s'établit à Petersbourg en qualité d'interprète Chinois." Can any man doubt

* It is because we most cordially approve of practical and effectual reforms, that we as heartily set our face against the visionary projects which would impede them.

that when the excellent Mr. Jeremy Bentham opened his famous communication with the Emperor of Russia, he had an eye to some similar employment in the same capital? We know of the Abbé Barin, on the best authority, that "son grand but était de juger par le sens commun de toutes les fables de l'antiquité;" while Mr. Jeremy Bentham has written a book for the express purpose of exposing popular fallacies, that is, moral political and metaphysical untruths; in other words, fables, which have blinded and perverted the minds of men from a remote antiquity.

Once more; M. Barin (the uncle) was "très respectueux pour les dames, et zélé pour les loix;" now, our authorities say nothing as to Mr. Bentham's respect for the ladies; but with his numerous French connexions (the nephew himself learnt, he says, the beauties of registration by residing as a landowner in the south of France), it cannot be imagined for a moment that he is wanting in a quality so highly valued by the great nation: and as to zeal for the laws, why Mr. Jeremy Bentham has spent a long life in framing codes of laws for people who were stupid enough not to adopt them, and abusing laws which (whether good or bad) it is strongly surmised he does not understand.

The abbé's nephew exclaims, "Que M. Barin était chaste!" Mr. Jeremy Bentham has lived a bachelor to the age of fourscore.

Lastly, when it is remembered, that the Abbé Barin detested a bishop of Gloucester above all other men; and that the respectable Mr. Bentham, in his excellent work entitled *Church of Englandism*, betrays a similar animosity against the episcopal order; it is impossible any longer to doubt that the one uncle is the counterpart of the other. They are duplicates of the same thing; in the language of the register bill, duplicate originals.

We have directed inquiries as to the death of the Abbé and the birth of Mr. Bentham: if the registers tally, if the chronology bear us out, we shall bring this forward as a case of metempsychosis, proved by internal evidence.

Considering, then, how ably Mr. Bentham was defended in a former state of existence by his then nephew, Mr. George ought to have felt it a sacred duty to make the *Défense de mon Oncle*, which he has undertaken, equally complete. The former defence was written against one who cribbed the uncle's title-page, "croyant que ce seul titre supplément aux idées de mon oncle lui attireroit des lecteurs." Now, we appeal to the whole world, whether the conduct of the present nephew be not more like the conduct of the enemy than of the defender of his uncle; whether the mention in his pamphlet of the "idées de mon oncle" be for any other purpose but "pour attirer des lecteurs?"

Mr. George Bentham boasts of being the possessor and (O shade of Dumont!) editor-elect of his uncle's MS. treatise; he must therefore be presumed to have derived all the improvement which a thorough study of that work can impart: if, then, his pamphlet be a blunder, and prove him to be a dunce, what will the world say of my uncle's *Nomography*?

The world, however, must not judge too hastily; Mr. Jeremy Bentham's sole error may be that he has committed his *Nomography* to incompetent hands. With all his faults, and all his little absurdities, he is a man of real talents; and we shall never believe that a veteran precisian in logic and language like him, has taught his nephew to begin a work published to exemplify as well as to advocate

the advantages of precise and correct expressions, by such a phrase as "some general modifications of the style of the whole act," which is pure nonsense; and to follow that up by an intimation that it is essential that "every country gentleman should understand the register bill," when it is not only not essential, but is morally impossible that any man who is not a lawyer should understand it, or any other bill embodying the same plan. The uncle never would have said that this bill was to be in any sense the groundwork of a new system of laws, projected by two sets of commissioners; when it is notorious that there is no new system projected at all: and whatever alterations may be made, it is impossible that they can be a system projected by the two sets of commissioners, as those commissioners do not even communicate, but become acquainted with each others' labours by the same means, and only by the same means, by which those labours are given to the public at large.

Neither do we believe that Mr. Jeremy Bentham taught his nephew to quote another man's work, as he does at page 4, and to have the boldness to put a false construction upon his own quotation. We also acquit the uncle of using such phrases as "adding into the heart of," "malafide lawyers," &c. in the very same page in which he lays down his ideas as to what correctness of expression is. We doubt whether the uncle would use the phrase "generalise a clause," when he means extend it: whether he would lay down a rule, "always to apply the same names to the same ideas;" and begin his pamphlet by applying the name of *bill* in the second line to the same idea to which he applies the name of *act* in the fourth line; and further exemplify his own rule by applying the names "special" and "specific" to the same idea, and that in many cases in which neither is the proper name; whether he would also shew his feeling of the importance of his own rule by using the terms "entering a caveat" and "registering a caveat" indiscriminately, and that in his own bill.

We are quite sure that the old original nomenclographer himself, however anxious to depreciate the bill of the commissioners, would not have charged the bill with being obscure, and made good the accusation by misprinting it. In the only instance in which we have consulted the pamphleteer's reprint, we found a clause made utterly unintelligible by his substitution of the word "reference" for "entry."

Finally, we are certain that our old friend would not have written a pamphlet of skumble-skamble stuff, setting sound sense, law, logic, and grammar, all equally at defiance; and that if he had framed a register bill, he would not have framed one through every other clause of which you may (in Irish phrase) drive a coach and six.

The Iliad of Homer. Translated by William Sotheby. 2 vols. 8vo. pp. 826. London, 1831. Murray.

It has been our good fortune to be able to lay before our readers several specimens of this important work, as they were read at the meetings of the Royal Society of Literature;* from these, alone, the public might appreciate the value of Mr. Sotheby's production: and we are glad that we have enjoyed such means of partially gratifying the curiosity which must be excited by a new translation of

the *Iliad*; because we are obliged to claim the space of a week, in order to compare it with the original, as well as with Pope's, and other versions, before we can offer a criticism upon it. At present we shall only say, that the portions we have read give us a high opinion of Mr. Sotheby's fidelity. Of his competency and talent, no doubt could be entertained: the poetry of Wieland's *Oberon* stamped him a true poet; the Georgics of Virgil, a classic of the right feeling; and Saul, Italy, &c. &c. added flowers of no slight bloom to the chaplet with which these greater efforts had adorned his brow. Altogether, if so brief an examination may entitle us to say so, we would speak of this performance as an honour to the present age of English literature. The poem appears to be in extent between eighteen and twenty thousand lines.

German Poetical Anthology; preceded by a concise History of German Poetry, and Notices of the Authors selected. By A. Bernays. Second edition, with additional Notes, &c. Pp. 420. London, 1831. Treuttel and Co.

WE are glad we have not been mistaken when we recommended this handsome and useful book on its first appearance. The comparatively short time in which the first edition was exhausted, is a good proof that the students of the German language, and the lovers of German literature, were of the same opinion as ourselves. We are nevertheless pleased that the author has not rested satisfied with his success, but has rendered this new edition still more worthy of public approbation. The pieces selected are generally the best of the best German writers, and the work is by this, and the clear and forcible historical sketch with which the selection is preceded, well worthy of a place in the library; while the notes and grammatical references by which the extracts are accompanied, will prove eminently useful to the student.

German Prose Anthology; with Grammatical References and Notes by A. Bernays. 12mo. London, 1831. Treuttel and Co.

THIS is also a very good selection, but it is not by the author of the *Poetical Anthology*; who, we have no doubt, would, to judge from the knowledge he displays in this work, have been able to collect a nosegay of greater elegance and variety than the one here presented. Nevertheless, in consideration of the useful hints to the reader of German, given by Mr. Bernays in the introduction, and the excellent notes he has appended to this volume, long known by the German title of *Prosaische Anthologie*, we would recommend it as an introductory reading book.

History of the County Palatine of Lancaster; embellished with Views, Portraits, Maps, Armorial Bearings, &c. By Edward Baines, Esq.: the Biographical Department by W. R. Wharton, Esq. F.S.A. 4to. Part I. Fisher, Son, and Jackson.

"IN exploring the historical treasures of this county," says Mr. Baines, "for the purposes of a late publication, the author of this work was surprised by the vast body of information dispersed throughout its various parishes, and gratified in the highest degree by the readiness with which it was every where laid open to his inspection: thus encouraged, his views expanded beyond their original limits; and though he sat down only to write a *sketch*, he rose with the ambition to complete a *history*

of his native county. The materials which he thus collected, his close and extensive connexion with the county has enabled him continually so to increase, that they form a store more rich and varied, perhaps, than is possessed by any other individual in the kingdom, on the subject of Lancashire history; and he now submits to his readers, in a connected and condensed form, a work comprising all the valuable and various matter which is scattered through piles of detached volumes, or locked up in the numerous unpublished pedigrees and other MSS. in his possession, or to which he may have access."

Judging from the specimen before us, we have no doubt that this will prove an exceedingly valuable topographical work. The present part is illustrated by a portrait of Humphrey Chetham, the founder of Chetham Hospital, in Manchester, and by a very beautiful view of the town of Lancaster, engraved by W. Finden, from a picture by J. Henderson.

Dependence. By the Author of "Little Sophy." Pp. 354. Derby, 1830, Mozeley and Son: London, Cowie and Co.; and Harris.

HAD at least one third of this volume been omitted, the rest would have been greatly benefited. Under the idea of being easy, the writer is very diffuse. Opinions of all sorts and on all subjects, bishops, socinianism, literature, preaching, &c. &c. are most heterogeneously blended, and somewhat freely expressed. Great part of these letters can have no possible interest for the public, which can scarcely be supposed to care much for the Rev. E. T. V.'s flirtations before he made his choice of the fair writer, at the risk of "breaking some half dozen hearts." Nor can it be a matter of much consequence that she, as it is elegantly expressed, is likely "to get her trimmings" for speaking disparagingly of a favourite child's temper. The author has left on us the impression of an amiable and clever woman—and one very likely to inspire that partiality in her friends which has misled her in the present instance. To connexions and relatives only are the greater number of these letters suited. The narrative part is good, and has an air of truth which must interest the reader in the fate of, certainly, one of the most dependent beings in the world, a young female, who, by her own exertions, must make her way through a harsh, or at least an indifferent world. Truly a governess is expected to have all the amiabilities of the country, and the accomplishments of the town; and, after all, to find, that, like virtue, they must too often be their own reward.

Bourrienne's Memoirs of Napoleon. Translated by Dr. J. S. Memes. 4 vols. 12mo. New edition. Edinburgh, 1831, Constable and Co.; London, Hurst and Co.

WE have often spoken of this work, and already of the present translation as it appeared in *Constable's Miscellany*. We have therefore only to notice that the present is a very neat edition.

Select Library. Vol. I. *Polynesian Researches.* By William Ellis. Vol. I. Second edition, enlarged and improved. 12mo. pp. 414. London, 1831. Fisher, Son, and Co.

MR. ELLIS's works in their original form—the *Tour through Hawaii*, or *Oukhyhee*, and *Polynesian Researches*—were not only extensively popular, but received the warmest encomiums from every reviewer whose notice of them we have seen, especially from the *Quar-*

* The publication is appropriately dedicated to the learned President of the Society, the Bishop of Salisbury, and to the author's brethren, the members of that body.

lively Review and the whole host of religious periodicals: they seem, of course, to offer a good foundation for a new Library series, differing in plan from any of those yet called into existence. Of the first specimen, we need only say that Mr. Ellis has made considerable improvements in his interesting narrative.

The Pious Minstrel; a Collection of Sacred Poetry. Pp. circ. 360. London, 1831. Tilt. With a portrait of Robert Pollok, and an appropriate vignette, this little volume, about the size of a small Prayer-book, contains two or three hundred compositions from the pens of well-known writers, such as Pope, Milton, Young, Milman, Hannah More, Scott, Southey, Wordsworth, Mrs. Barbauld, Bernard Barton, Pollok, James and Robert Montgomery, Mrs. Opie, Watts, Wesley, Toplady, Kirke White, Hemans, Heber, Doddridge, Grahame, Caroline Fry, Conder, Croly, Cowper, Bowring, Darwin, Cunningham, Burns, &c. &c. &c. It is a delightful publication to be put into the hands of youth, alluring to piety and virtue through the sweet paths of poetry.

School and College Greek Classics.—1. *The History of the Peloponnesian War, by Thucydides; with Original Notes.* By the Rev. S. T. Bloomfield, D.D. F.S.A. 3 vols. 12mo. —2. *The History of the Persian Wars, from Herodotus; with copious Notes.* By Charles William Stocker, D.D. In 2 vols. 12mo. Vol. I. London, 1831. Longman; Baldwin; Whittaker.

These useful and economical works continue to issue periodically from the classical press of Mr. Valpy. The valuable annotations of Dr. Bloomfield on Thucydides are a sufficient recommendation of themselves to ensure the ready reception of this edition. The text is conformable to the most approved authorities, and the type clear and distinct. The notes to the first volume of Herodotus, by Dr. Stocker, are not only a source from which much sound scholarship may be gathered; but from the collation of similar idioms, and the comparison of parallel passages, an enlarged and comprehensive acquaintance with the peculiarities of the language cannot fail to be derived. We do not recollect the whole range of the classics being brought to bear more effectively upon the illustration of an author and of each other, than they are made to do under the expansive mind of Dr. Stocker. The Examination Questions attached to the end of each volume are well calculated to brush up the memories of the oblivious, and resuscitate the faculties of retention.

ORIGINAL CORRESPONDENCE.

TOADS.

To the Editor, &c.

Sir,—In your last Number, I observed a curious statement from Mr. St. John's *Narrative of a Residence in Normandy*, of his having been puzzled to account for strange music all around him on a night in spring. He describes the noise as resembling the distant tinkling of small bells breaking suddenly upon the ear. He mentions that the peasants, of whom he inquired the cause of this strange music, generally attributed it to the toads. I should have been of their opinion, from my own observation of a toad which I kept and watched continually for nearly two years. I was often suddenly surprised by his making a sharp tinkling noise at night, or late in the evening, which often made me start as I sat reading or writing; and for

some time I was at a loss to account for so unusual a noise. As well as I recollect, it occurred in the spring, but I think also in the summer months; and I noticed that it chiefly happened after a continuance of dry weather, and before rain. The noise was exactly such as described by Mr. St. John, and it differed entirely from the usual croaking of toads, which differs also from the noise of frogs. Being thus led into the subject, it may be amusing to your readers to know the particulars of this curious fancy of mine to keep a toad. All our natural histories are strangely deficient in their accounts of this poor persecuted animal; some of them continue to repeat old stories, and cherish old prejudices in their regard, which in these enlightened days of scientific discovery are really disgraceful. Partly from a desire to familiarise myself with an animal so generally abhorred, and partly to learn by my own observation such particulars of its history as I had in vain sought for in books, I began to keep a common toad, which I picked up in my garden June 28, 1827. It was a male, and I think about a year and a half old at the time of my taking it into custody. He measured then an inch and three quarters in length; but in the following October he had increased to two inches and a quarter. His greatest length before he died was two inches and a half; and I considered him then as full grown, as I never saw a male toad larger, though I have observed a great number. The large heavy toads which we see, sometimes of enormous bulk, are all females. Having often kept the German *laub-frosch*, or beautiful green leaf frog, I adopted nearly the same plan with my toad. This was to place him in a large glass jar, with moss at the bottom, and sometimes water enough to saturate the moss, but oftener with only a piece of green sod, which I changed when the grass began to wither. Sometimes I contrived to let him have a little well of water in the sod; but I never saw him go into water freely; only when he was frightened, he would plunge in and bury his head at the bottom under the sod. Whether he ever knew me, I much doubt; but certainly he was always perfectly tame, and would sit on my hand, let me stroke him, and walk about my table or carpet with apparent familiarity and contentment. I usually let him out on the table every day; and he would jump down upon the carpet, and hop and crawl about, always making for the skirting-board, which he climbed very ludicrously, and seemed fond of sitting in a corner on the top of it. He ate freely, from the first day I had him; but would never take any thing unless he saw it move. In the whole time, I gave him all the following varieties: flies of all kinds, wasps, and bees, first removing their stings; gnats, which he would snap up at the window, while I held him on my hand up to the pane of glass, with an eagerness that appeared insatiable, and was very amusing; clap-baits, lady-birds, caddices, ants: of these last I used occasionally to give him a treat, by bringing home part of a hillock, and putting him down in the midst of it. He would raise himself on all fours, and with his eyes glistening with something like civic ecstasy, would dart out his tongue, right and left, as rapidly as lightning, and lap up the ants in quick succession, with the most laughable gulosity. I also gave him earwigs, glow-worms, wood-lice, grasshoppers, spiders, dragon-flies, ticks, horse-leeches, grubs, moths, and any insect I could meet with. All seemed equally welcome, either by night or day; but it was most diverting to see him contend with

a worm. He would dart upon it, secure one end, and swallow with all his might; but the worm would annoy him by creeping out of his mouth before he could swallow it entirely; and I have known him persevere for nearly half an hour, attempting to secure his prize, while the worm kept constantly escaping. He would take a snail, when he once saw it extended and in motion; though he always dashed at the shell, and took all down together in a moment, but could not manage one of large size. It was to me a great source of amusement to feed him, and watch his singular movements. He was often frightened, but very seldom provoked. I once or twice, however, provoked him, I think, to as much wrath as his cold nature was susceptible of; but I feel quite assured that the toad is at all times perfectly harmless and inoffensive: the idea of its spitting or otherwise discharging venom is, I am convinced, wholly unfounded.

In the winter months my toad always refused food, though he did not become torpid, but grew thin, and moved much less than at other times. He did not eat from the end of November to March, gradually losing his appetite and gradually recovering it: he never seemed affected by cold, except in the way of losing his inclination for food. He was most lively towards evening, when his eyes became most brilliant; and he was then more sure of seizing his prey than in broad daylight. On the 29th of March 1829, I found him dead, in the position in which he had sat for several days before, and with his eyes closed. His death was caused, as I imagine, by the unusually long continuance of severe weather in that winter, which appeared to exhaust him before his natural appetite returned: he could not have died from starvation, for the day before I had tempted him with a lively fly, which he refused.

This toad was generally of a dirty yellow or brown colour, which, upon looking at him closely, appeared like gold, however unlike it at a distance; but at various times he assumed different hues—sometimes greenish, sometimes nearly black. I do not believe that the colour of toads has any connexion with the weather, whatever may be the case with frogs; for I have observed several hundreds of toads together upon a warm day in spring, all in one place, and exhibiting among them every shade of colour. It is pretty generally known, that the spawn of toads is very different from that of frogs: it is in very long strings of gelatinous substance, studded with black specks, all in a row, appearing on the water like threads of black worsted. I took some of this spawn one year, on the 14th of March, and put it into a large basin of water: it produced tadpoles on the 12th of April, which fed upon the glutinous matter around them till it was exhausted, when I fed them with pond-weed, of which they ate voraciously. In the middle of June they put forth two hind feet; and in the beginning of July they had fore-feet, after which their tails shrunk up and disappeared. On the 5th of July I put them into a glass with only water; but several were drowned, being unable to get out of the water: I then placed them in another glass with a sod; they were lively on the 12th of July; but I could not find any food which they would take—I tried the smallest insects, but could get nothing so suit them. The consequence was, that they all died by the end of the month. I was desirous to bring up a young toad from the very spawn. If any of your readers can give information as to the food of toads as soon as they begin to crawl

about, I shall be glad. If the foregoing particulars are likely to interest your readers, you will oblige me by publishing them in your next. I remain, sir, &c.

March 7, 1831.

F. C. HUSENBETH.

ARTS AND SCIENCES.

ROYAL INSTITUTION.

DR. EDMUND CLARK on the remarkable volcanic phenomena exhibited by Vesuvius, and on the discovery and remains of Pompeii. The Dr. began by retracing and exhibiting views of the volcano from its present state to that mentioned by the early writers, and placed clearly before the imagination the sublime spectacle of a fierce eruption, by the aid of some very large and effective drawings; entered into the remarkable appearances presented by the fiery streams of lava; and shewed various specimens of ashes and lava ejected by the mountain. Having rapidly described the more violent eruptions of modern times, he went back to the recorded narrative of the destruction of Pompeii and Herculaneum by Pliny; then, carrying the attention to a large plan of the city of Pompeii, he described its discovery, and reverted to the fact mentioned by Suetonius, that some of the Pompeians did return to search for their buried property. Entering the Forum Nundinarium, and describing its general appearance and uses, Dr. Clark passed on to the theatres; then to the house of the sculptor, the temples of Æsculapius and Isis, and the fate of its priests. Advancing along the streets, a succinct description was given of the blocks of lava which form the main road; of the raised foot pavement, the worn impression of wheels, the signs of the houses, the shops, and their general structure; the Forum, Temple of Venus, granaries, and prison; the mode of shutting the Forum at night, and general superiority of the public edifices. Then, issuing from the Forum, winding along the narrow streets to the house of Actæon, and stopping at intervals to exhibit various utensils found among the ruins,—a bell, vase, metallic mirror, saltcellar, specimen of Pompeii glass, with drawings of many other domestic instruments,—he went on to the Herculanean Gate and the Street of Tombs, describing and exhibiting large sketches of the house of Diomedes; the subterranean apartment, containing amphore, and the position of the group of skeletons found huddled together near the end of the room round that of their mistress, who was distinguished by gilded bracelets, and other costly ornaments. Then passing down the Street of Tombs, and detailing the appearance of the few skeletons there found, near the semicircular seat, he returned through the ruins of the city to the amphitheatre at its further extremity,—and concluded a lecture, crowded with facts, by some account of the specimens of bread, fruit, the *ceratonia siliqua*, and other curiosities discovered among the ashes. The lecture was protracted beyond the usual period, but the subject seemed to excite general interest.

Many fine works and specimens were in the library, illustrative of the subject in the lecture-room. There were also models of a tide semaphore, for indicating the depth of water in a harbour mouth, to vessels at sea during the night-time; of Colonel Walker's fire-escape; and other useful inventions. Two curious

* Colonel Walker is, we believe, exhibiting this experiment publicly, and with great apparent success. It is a valuable and ingenious plan; and we only wonder that similar things are generally so long in procuring adoption.

native Kandyan drawings, descriptive of some historical circumstances in the revolution of 1812, were also exhibited.

COLLEGE OF PHYSICIANS.

SIR HENRY HALFORD, Bart. in the chair. This was the second meeting of the season. Dr. Francis Hawkins, the registrar, read a paper from the pen of Dr. Heberden, on the general principles to be observed in the management and care of the sick; in which the moral conduct of a physician, as contrasted with *charlatanerie*, and his professional conduct, as contrasted with empiricism, were set forth with admirable sense and judgment. The true physician, the author observed, will not seek to cure diseases by luck, but by skill; not by the magical agency of a nostrum or specific, but by the judicious use of those means which the experience of former times has placed in his hands. Nor will he be contented with understanding the structure and physiology of the body alone; but will seek to estimate and to regulate the corresponding influence of the mind. He will judge when it is proper to soothe and encourage his patient, when to alarm his fears, and when to animate his hopes. Although he may seek on some occasions to prevent surprise, and to blunt the keen edge of affliction; yet will he never forfeit his patient's confidence by violating the truth. In the treatment even of incurable disorders, he will still endeavour to alleviate or soften those calamities which he is unable to avert. When he can do nothing else, he may still, in the language of the poet,—

"Make languor smile, and smooth the bed of death."

Even in the last solemn hour, a judicious physician will be regarded as a friend, under whose care the dying man will utter his latest breath with more complacency. The value of a physician's attendance is likewise very sensibly felt by the friends and family of the sick. They are relieved from a heavy weight of responsibility; from the doubts and fears of erring in matters which may be of importance, and from the painful task of judging often between jarring opinions officiously obtruded upon them. For these things the physician is the proper remedy; and not only his skill, but his prudence, should be such as to inspire confidence, to remove difficulties, and to take upon himself, if necessary, the entire charge and management of the sick.

The author proceeded to notice certain errors in modern practice, particularly the *abuse* of calomel in every kind of case, in the hands of ignorant pretenders. The treatment of some disorders also, such as heartburn, worms, and dropsy, he considered to be often conducted upon narrow principles, and directed rather to the relief of particular symptoms than to the removal of their cause. In conclusion, he suggested some reasons for calling in question the propriety of concentrating the virtues, and reducing the bulk of medicines, in the manner which has more and more prevailed of late years.

GEOLOGICAL SOCIETY.

WEDNESDAY, March 2.—Roderick Impey Murchison, Esq. president, in the chair. Several fellows were elected. A paper was first read "on the ripple marks and tracks of animals in the Forest Marble," by George Poulett Scrope, Esq. The reading of a paper was then begun, entitled, "Description of a series of longitudinal and transverse sections through a portion of the carboniferous chain between Penigant and Kirby Stephen," by Professor Sedg-

wick. Among the donations laid upon the table, was a collection of recent shells from the sea-coast near Swan River, presented by Archdeacon Scott.

MEDICO-BOTANICAL SOCIETY.

EARL STAMHOPE in the chair.—A translation from a Spanish dissertation on the first discovery of the guaco plant in South America—the medical uses of which have been repeatedly adverted to in the *Literary Gazette*—and a paper by Dr. Hancock, on the tasteless emetic, were read by Dr. Sigmund. A lecture on the *papaver somniferum* was delivered by Mr. Gilbert Burnett, the professor of botany; Mr. Evered illustrated the lecture by a variety of experiments, and gave a chemical history of the discoveries of morphine, narcotine, and meconic acid, the details of which would neither be interesting nor understood by the general reader. Mr. Clendinning was elected secretary, in the room of H. Gibbs, Esq., who was elected treasurer, in consequence of the resignation of his father.

SINGULAR EFFECT OF HEAT ON METALS.

A DISCOVERY of a very curious nature, and one which promises to throw light on the subject of the propagation of heat among bodies, has recently been made by a gentleman now studying at the university here, Mr. Trevelyan, son of Sir Arthur Trevelyan, of Northumberland. It is this:—if a bar of iron or brass, a common poker for instance, be heated in the fire, and then laid down on the floor or on a table, with the heated extremity resting on the edge of a block of lead two or three inches square, and one inch thick, the round knob of the handle resting on the table; if it be then lifted up and laid down again several times, to try the effect of different positions, and rocked a little, so as to set it a-going; it continues for a long time vibrating and emitting a sound, varying in tone and intensity with the table or mass on which it stands. To exhibit the effect, however, more conspicuously, and always with decisive success, Mr. Trevelyan has bars of brass or iron made on purpose, about twelve inches long; three or four inches of the bar at the one end is broad and flat, having the under-side formed with a longitudinal ridge, on which the bar being laid, may rock or vibrate easily up and down. This part is about one and a half inches broad, and one-half inch thick at the ridge; the remainder of the bar is formed into a round handle, about one half inch diameter. When the flat end of this bar is heated, and laid with the ridge on a flat block of lead, an inch or two thick and several inches square, it immediately begins of itself a gentle rocking motion, which increases to a certain extent, and then continues uniformly for a long time moving regularly, and vibrating in a most surprising manner. If a bar of brass, ten or twelve inches long, be laid across the other, this vibrates along with it, and shews the effect still more conspicuously; if, instead of balancing the bar on the flat part of the lead, it be rested on the edge, and the other extremity on the table, no vibration is observable—but a loud and distinct sound is emitted from the apparatus, which continues for a long time to be heard. If we press with the finger on the table, or on the metal, the tone varies, and sometimes ceases; if we give the table a gentle rap, it again commences, and continues as before; if we set the apparatus on a box or sounding-board, the tones are highly musical. These are the principal effects which have

hitherto been discovered; they are, so far as we know, perfectly new, and certainly very curious and important. They evidently arise from some peculiar action of the heated metal on the cold, as the heat passes from the one to the other, and is gradually transmitted through the mass; and they serve clearly, we think, to unveil some of the mysteries by which this great element operates on the internal particles of matter, penetrating into the heart of every substance, and diffusing continually its influence, until an equal temperature prevails throughout.*

BISCUIT-BAKING BY STEAM.

UNTIL within the last few years, all the flour and biscuit consumed in the navy was furnished by private contract. The most flagrant impositions and frauds were but too generally the consequence of this mode of supply, in defiance of all the vigilance of the heads of departments. The flour and biscuit were stipulated to be of the second-best quality; but instead of this, the former was generally mouldy, damaged, or of a very inferior description to that bargained for; while the latter was usually compounded of bad flour, bean meal, old worm-eaten biscuits ground down, and various other cheap or unwholesome materials. To obviate these frauds, government, a few years ago, erected steam-mills at Deptford and Portsmouth, for the purpose of grinding flour for the navy; and a very superior and cheaper article being the result, it was determined, in addition to grinding the flour, to attempt also the manufacture of biscuit from it, at these establishments. The impossibility of accommodating and effectually superintending the multitude of bakers required to knead the dough in the usual way, by hand, so as to effect the supplying of the whole navy, would have rendered this praiseworthy effort, in a great measure, abortive, had not the ingenuity of Mr. Grant, storekeeper at Portsmouth, obviated the difficulty. By the attachment of a few simple pieces of machinery to the engine driving the flour-mill, the dough is now worked, rolled out, and stamped into biscuits, with an expedition inconceivable, and with a saving of two-thirds of the number of bakers required to perform these processes by hand. The flour and water are first put into a trough, through which passes an iron spindle, armed with eighteen knives, in two rows, i. e. nine in each row, on opposite sides of the spindle. A strap connected with the engine turns the spindle round; and by means of the revolving knives, the flour and water are in a few minutes worked into dough fit for being stamped into biscuits. The dough is now taken piecemeal from the trough, and shaped by hand into longish rolls, upon two movable baking-boards, supported by small iron pillars, having castor-wheels at top: these pillars are in three rows, extending from the trough to the two rolling-machines; and along the castors upon their tops the baking-boards are pushed, by hand, towards the rollers, under which the dough is rolled out into thin cakes, by their backward and forward swinging motion. The baking-boards are now pushed out, by hand, from under the rollers, and slid along three other rows of pillars connecting the two rollers with the two cutting machines, each containing forty-two hexagonal dies, under

which they are momentarily placed, and eighty-four biscuits thus cut out by a single stamp of the two machines. The kneading, rolling, and stamping portions of the machinery, being all separate, can consequently be put in motion or at rest at the will of the baker. By the machinery at Portsmouth, under Mr. Grant's superintendence, 160,000 pounds of biscuit can be manufactured in twenty-four hours—constituting a day's ration for the crews of twenty sail of the line; and with eight or ten such pieces of machinery, biscuit rations may be daily manufactured for 160,000 men, being the greatest number of seamen and marines employed during the hottest period of the war. About 5,000*l.* has been expended in erecting the baking apparatus at Portsmouth; a considerable portion of which expense was naturally occasioned by the alterations and improvements consequent on the erection of a new piece of machinery; but even this sum will be refunded to government during the first year of its employment, by the saving made. This saving of expense, however, is not the only recommendation—the biscuit being free from flintiness, and in every respect more palatable than that baked by hand, in consequence of being more thoroughly kneaded. From the rapidity of the manufacture, also, no more biscuit need now be baked than is required for immediate use, from the supply by this process being as certain as it is rapid; so that our seamen will in future have always fresh-baked and wholesome biscuit served out to them, even on foreign stations, instead of the stale, mouldy, worm-eaten, and unpalatable contract trash generally furnished during the war, which had often been baked for years before issued. It is only those who have been doomed to the penance of the contract flour and biscuit that can duly appreciate the great boon conferred upon our brave seamen by this project of the government; the above articles now supplied to the navy being very superior in quality to those furnished the merchant service—such, indeed, as are fitting for any gentleman's table; and all this at a much lower cost than the former contract supplies.

The first bags of biscuit of this manufacture having, in addition to the usual King's mark of the broad arrow, the word "Machinery" stamped in capital characters upon them, this novel and imposing symbol at once struck the eyes of the superstitious tars as something very mysterious, and many were the solutions attempted of the enigma; until one, more deeply read than the rest, dropping upon one knee, and rolling his quid round and round in his mouth, while tracing with his finger and spelling and re-spelling over and over the ominous word, at length started up from his reverie, and exclaimed with an oath, "Why, it aint' only the name of the swab of a baker—Mac Henry, Mac Henry, that's all that's in it!" and the "machinery biscuit" is now, consequently, known among the tars by the cognomen of "Mac Henry's biscuit." P. C.

LITERARY AND LEARNED.

ROYAL SOCIETY.

H. R. H. the Duke of Sussex in the chair.—A paper, by H. R. Palmer, Esq., entitled "Description of a graphical register of tides and winds," was read. The Bishop of Chester, Lord Selkirk, and others, were admitted fellows. The President described the gracious reception the Society's Council met with at court on Thursday—that his Majesty, according to ancient custom, had written the

royal signature in the Society's book of laws—that he was exceedingly anxious for the welfare of the Society, expressing a wish that a friendly intercourse might be cultivated with men of science at foreign courts. Her Majesty the Queen also received the Council very graciously, and answered its address in corresponding terms. In conclusion, the royal Duke observed there was no wish of his heart more sincere than that the favour entertained by their Majesties for the Society might promote a perfect and permanent unanimity amongst the members—a feeling which was responded to by the cheers of the assembly.

SOCIETY OF ANTIQUARIES.

MR. AMYOTT in the chair.—S. W. Thack, Esq. exhibited to the Society a square-shaped glass vase or pitcher of large dimensions, and three cups of red pottery, all apparently Roman, found at Harpenden, on the Luton Road, about five miles from St. Albans. Mr. Knight exhibited some Roman clay coin-moulds, one with a coin in it, discovered near Lingwall Gate, in the parish of Wakefield Outwood in Yorkshire. It appears questionable whether these moulds were for casting coin to pay the soldiers in Britain, or whether they were the work of Roman forgers of coin. The secretary continued the reading of the Rev. John Skinner's letters on the site of Camelodunum.

ASIATIC SOCIETY.

SIR GEORGE STAUNTON in the chair, who liberally presented three celebrated Chinese works, in history, classics, and novels; and Sir Alexander Johnston, a double sea cocoanut in its husk, procured from one of the Seychelle islands. A portion of one of these cocoanuts always forms a part of the annual present sent by the sultan of the Maldives to the Ceylonese government. It is believed by the superstitious natives to be one of the articles produced by the sea when it was churned by the good and evil spirits to obtain the cup of immortality. Mr. Elliot presented a variety of curious objects in natural history, and some Persian MSS. Mr. L. Kennedy a piece of bamboo, containing the substance called in India *bhanslochun*, or *tabasheer*,—together with specimens of the substance. This substance resembles the opal, without the polish, and is used by the native physicians; with what effect, however, is a matter not stated. Dr. Turnbull Christie observed, that it is a silicious substance, and when the bamboo was green is moist and translucent; in this respect remarkably coinciding with the chalcedony, which in the rocks (chiefly basalt) where it is met with, has frequently the same appearance, but becomes hard and opaque, like the tabasheer, when exposed to the air. Dr. Christie likewise remarked, that it was not produced only in bamboo, but was also found in teak; neither was it found in all kinds of bamboo, nor in all parts of India. He was requested to furnish a written communication on this curious substance. A further portion of Colonel Broughton's Hindu almanac, and part of a Muhammadan History of the Prophets, were read.

LITERARY FUND.

ON Wednesday the general annual meeting of the Literary Fund, for the election of officers, &c. was held at the chambers of the Society in Lincoln's Inn Fields. The president, the Duke of Somerset, was re-elected; as were also all the vice-presidents and the council, with little alteration. Vacancies from retirements, &c.

* We have copied this interesting notice from the *Edinburgh Courant* of the 26th ult., having previously heard only vague rumours of the remarkable experiments which it describes. The editor considers the discovery to offer a singular confirmation of Professor Leslie's theory in his *Lectures on Heat*. No doubt the experiment will be speedily taken up by philosophical inquirers in all parts, at home and abroad.—Ed. L. G.

were filled in from the general committee. The auditors' report of the finances was read, and exhibited a favourable state of the funds, though the relief administered to suffering meritorious authors, and their widows and orphans, had been very considerable; as every case of distress and desert had been relieved with a liberal hand. The club afterwards dined together, the Earl of Mountnorris in the chair; and the anniversary was appointed for the second Wednesday in May, when a numerous attendance of the principal patrons of literature, and of the leading literary characters of the age, is anticipated.

FINE ARTS.

NEW PUBLICATIONS.

The Ruins and Scenery of South Wales; from Drawings after Nature by J. E. H. Robinson; executed on stone by J. E. H. Robinson, J. S. Templeton, and G. Childs. No. I. Englemann, Graf, Coindet, and Co.

"THE castle and monastic ruins, and other architectural antiquities of Wales," observes Mr. Robinson, in his prospectus, "are very numerous; those of South Wales exceeding fifty; and are justly celebrated for their picturesque beauty, and variously interesting expression. Many of them are in high preservation, and, from their generally bold and elevated situations, objects of commanding attraction and interest. The scenery that surrounds them is generally fine, and often extremely captivating and impressive. Ruins are always interesting, and generally the principal features in the scenes in which they appear; bestowing additional charm on surrounding objects, and often receiving from them an increase of beauty and expression. The eye dwells on them with delight, and the mind muses with agreeable melancholy; recalling the times long passed in which they flourished; and seeing in them but an image of its own fleeting and perishable existence."

The work is to consist of twelve numbers, each number containing six plates. Those which embellish the present number are full of picturesque quality, and are executed in a fine, bold, artist-like style. This is a publication well calculated to assist in reviving that just admiration of our domestic scenery, which the facilities of continental travelling have for some years in a great measure suspended.

Views in the East, comprising India, Canton, and the Shores of the Red Sea. From original Sketches by Captain Robert Elliot, R. N., with Historical and Descriptive Illustrations. Part VII. Fisher, Son, and Co. *The Palace of the Seven Stories, BEEPAPORE*; "a ruin," says Captain Elliot, "of as great beauty and as much elegance as any of the finest Gothic antiquities of Europe;" *Jahara Bang*, or "the garden situated on the bank of the Jumna, opposite to the upper part of the city of Agra;" and *Abkar's Tomb, Secundra*, "in point of magnificence the most remarkable of all the Mogul monuments;" are the embellishments which the pencils of Messrs. Purser and Boys, and the gravers of Messrs. W. Finden, W. J. Cooke, and J. Ralph, have furnished for the seventh part of this fine collection of oriental scenery. The last-mentioned subject is singularly picturesque and grand. "Abkar," it is observed, "was a noble and a justly renowned monarch, who left behind him the greatest name that was ever known in India, in Mahomedan times."
• • • When Sir George Nugent's army

was at Agra, in the year 1808 or 1809, a regiment of English cavalry was quartered, and their horses picketed, in this tomb. How distant from the mind of him, over whose ashes, and to whose memory, this great fabric was raised, must have been the conception, that such a scene would ever be witnessed at the monument of his power; or that ever a strange people should come, from almost the ends of the earth, to take possession of the empire that he had fought so hard, and laboured so strenuously, to establish!"

Views above Kurrah Manickpore. By Lieut. G. Abbott, 15th Regt. N. I. Drawn on stone by M. Gauci, F. Nicholson, and W. Gauci. Colnaghi and Co.

THESE views are very pleasing in themselves, and must be highly interesting to those who have visited, or who have connexions in, the part of India, namely, the province of Allahabad, to which they refer. When to this we add, that they are published as a mode of relieving Mrs. Abbott, Lieutenant Abbott's mother, a widow now in England after a long residence in India, who, with her family, has been left without the smallest means of support, in consequence of the recent failure of one of the first mercantile houses in Calcutta; we are sure we need not say any thing further in recommendation of them to our readers. The work is dedicated, by permission, to the East India Company.

ORIGINAL POETRY.

THE FAITHFUL.

THOU wert young, Love, ere we parted—a gay and graceful flower,
With heart as light, and brow as bright, as summer's sunniest hour;
With lips that shamed the forest rose, and whispers soft and low
As living streams of paradise at morn were heard to flow.

Thou wert young, Love, ere we parted—thy gift of life was blest
With hope that, like a spirit-bird, sang ever in thy breast;
Thy thoughts were like those fairy gems the good alone may find,
Thy cares like twilight clouds that shew the beaming stars behind!

Thou wert young, Love, when we parted—pale sorrow bathed thy cheek,
And sadder bodings chill'd thy heart than sighs had skill to speak;
But love hath wordless melody, an eloquence no tongue
May e'er express in human speech, or breathe in sweetest song!

The ship lay rocking in the bay—the southern breeze sprang fair;
I kiss'd thy cold and alter'd cheek, and wildly left thee there:
I wept not then, my lips were steeped in tears, but not mine own;
For grief had parch'd my heart's warm dew, and held it seared and lone!

The moonlight rose upon the sea, but found nor ship nor bark;
Like hills of silver shone the waves, but all the shore lay dark!
As though thy maiden beauty graced and gladden'd e'en the sea;
But, ah! the shore was dark, my Love, thy light had gone from me!

To other lands away—away—thy loveliness was borne;

Oh! wherefore, e'er we bade farewell, had I not died that morn?

The dawn rose o'er the purple waves all beautiful and free,

Yet still the shore lay dark, my Love, there came no morn for me!

Oh! I remember well the hour, when months and months were past,

Those blessed lines of love from thee—from thee arrived at last!

I kissed each word thy hand had traced, each sign thy touch had left,

And, trembling, hid it next my heart,—I was not quite bereft!

Thou wert young, Love, e're we parted; thy step was fleet and free,

And graceful as the dappled fawn that bounds o'er lawn and lea;

Yet why regret the lost, the sweet, the early scenes we ranged,

Through wave and storm, at length we meet—the same, but ah! how changed!

The daring breath of Time hath touched thy chestnut curls with snow,

Thy form hath lost its fawn-like grace—thine eyes their sunny glow;

Yet art thou still the same to me—ay, dear in thy decay,

As when, a bright and beauteous girl, thou heard'st my first fond lay.

Our passion was no sun-born flower a moment starts to light,

That wastes its bloom in one brief day, and withers in a night:

Ours was no transitory love, that like the rainbow plays;

And wreaths the memory just so long as it may charm the gaze!

But like the tree that lifts its head amidst the northern snows,

And steadfast weathers every breeze and every blast that blows;

That, when the latest leaf hath past, remembers but the spring;

For night which closes in so fast, a second morn may bring!

C. SWAIN.

2, Dacre Place, Manchester.

A SONG.

"Surely a sense of our mortality,
A consciousness how soon we shall be gone,
Or if we linger but a few short years,
How sure to look upon our brother's grave,
Should of itself incline to pity and to love."

Rogers.

O WHY do we darken with strife and with care
The brief gleams of sunshine that fall to our share?

Our whole span of life is so fleeting, Heaven [knows,
It seems but a wild dream that troubles repose.

And yet we oft waste it in futile desires,
In contests the demon of discord inspires,
And blight and destroy in our folly or wrath
The flowers that, spontaneous, spring up in our path.

How bright and how blest would life's pilgrimage be,

If in fellowship sacred all hearts would agree
To bear and forbear, in compassion and love,
And mercy that emulates angels above!

O then this wide earth, which at present appears

Distracted with tumults and tarnished by tears,
Would smile in the light of that spirit divine,
Like the Eden where Love reared his holiest shrine!

CATHARINE GRACE GODWIN.

Burnside, Westmoreland.

MUSIC.

PHILHARMONIC SOCIETY.

THE second concert, on Monday last, was, like the first, made up almost entirely of compositions from the German school, there being only two pieces of Rossini, and all the rest from Mozart, Beethoven, and Spohr. The frequent introduction of the latter composer, and his great and sudden popularity (at least, with the directors), are new proofs of the vicissitude of taste in music. Not more than a year ago, the Philharmonic audience, with very few exceptions, invariably used to murmur at the dulness of his unmelodious strains. There is, however, in most of what he writes, a solidity, which, when properly understood, compensates for the want of vivacity. The opera *Faust*, from which the overture and scena, "Che sento," had been selected for the present occasion, is, in Germany, reckoned his best work. The overture is very characteristic, but not easily comprehended on a first hearing; and we cannot guess why the concert should commence with an overture instead of a symphony, according to the long-established order, since the overture to *Faust* is not introductory to the scena immediately following. Signor Lablache is no stranger to the German school, having been for some years at the Italian Opera in Vienna; and Spohr's elaborate scena seemed to give him as little trouble as if it had been an aria of Paeisello's. The other two vocalists also—Mrs. Wood in the duetto "Bella imago" (Semiramide), with Signor Lablache, and Mr. Bennett, the new tenor, (in another duetto with the Signor), "Parlar, spiegar"—acquitted themselves most honourably. Beethoven's magnificent violin quartet in C minor, by Messrs. Tolbeque (from the Paris school), Griesbach, Moralt, and Lindley, contributed their ample share to the delight of the evening; and so did Beethoven's symphony in D, and Mozart's in C (with the fugue), each unique, and unexcelled in its kind. Under the masterly direction of Mori, they were both admirably performed, especially the first. Mozart's nocturno, for wind instruments, is an old favourite in the Philharmonic; though it cannot be denied that wind instruments, unrelieved by others, soon appear monotonous, particularly in a room. The whole concert went off exceedingly well.

DRAMA.

KING'S THEATRE.

La Cenerentola, with the admirable performances of Mrs. Wood, Lablache, De Begnis, &c., has revived the Opera, which generally languishes during the early part of the season. With the splendid spectacle of *Kenilworth*, the entertainments, altogether, deserve to be attended by crowded audiences.

DRURY LANE.

MR. KEAN has terminated his engagement. We fear it has not been a profitable one to the management. At the conclusion of his performance of *Brutus*, on Monday evening, he came forward, in obedience to the call of the audience, and expressed his thanks for the kindness he had received at the hands of the public. He spoke feebly, and was evidently labouring under severe illness. Nature and genius have performed, however, so many miracles for this distinguished actor, that we do not yet despair of seeing him terminate his theatrical career as brilliantly as it commenced. But, warned by wholesome though

bitter experience, he must retire,—not for three or four months, but for three or four years,—if he hope to recover his physical power, the decline of which, alone, has been perceptible during his late performances, the mind appearing to be as vigorous as ever, and the will to do having occasionally furnished him for a few moments with the absolute ability. Let him take no more foolish farewells.—The only novelty here since our last, has been the farce of *Decorum*, which, as we hear it was rather precipitately condemned, we are glad we did not see. The author, too, has moved for a new trial; and as he is one who has entertained us much upon former occasions, we sincerely wish him all the benefit of a fresh jury. The cause is down in the paper for next week.

OLYMPIC THEATRE.

A NEW piece has been produced, to gild the closing, short, but brilliant and successful season of this little theatre. It is from the pen of Mr. Planché, and called *My Great Aunt*,—which great aunt is greatly performed by Mrs. Edwin. The hint of this very clever and entertaining trifle seems to be taken from Pickard's five-act comedy of *La Vieille Tante*; but the author has, with his wonted skill, condensed its spirit into an Olympic nutshell,—all kernel, though enlivened with the maggot of Mrs. Edwin.

THEATRE FRANÇAIS.—It is said, that Messrs. Victor Hugo and Alexandre Dumas have offered to the commission, appointed by the Minister of the Interior to regenerate the Théâtre Français, to take upon themselves, at their own risk and peril, the direction of that establishment, without any assistance. It is added, that this proposition is warmly supported by M. le Baron Taylor, one of the commissioners.

VARIETIES.

United States' Expedition.—The scientific expedition for the exploration of the South Seas, fitted out by the United States, has entirely failed. The crew of the ship mutinied, and after having set the superintendents of the expedition a-shore in Peru, carried the vessel into St. Mary's, a little south of Concepcion.

Borate of Magnesia.—M. Gaillardot has discovered the borate of magnesia in the keuper gypsum, near Laneville.

Salt Springs.—For a long time they have been labouring at Lons-le-Saulnier, in France, to discover the mine of mineral salt from which the water proceeds that animates the salt springs. At length the undertaking has been crowned with success: the sound, after penetrating about three hundred and fifty (French) feet, has touched the salt bank.

Aurora Borealis.—A correspondent of the French Academy writes, that, one evening, making some magnetic experiments with magnetic needles, he suddenly observed a singular disorder in their action. The next day he heard that the aurora borealis had appeared at that time; and to that phenomenon he attributes the irregularity of the needles.

Atoms.—M. Becquerel, the French Academician, in making some thermo-electrical experiments on atoms, has ascertained that in certain combinations atoms arrange themselves as little galvanic piles, the reciprocal action of which constitutes what is called molecular attraction.

Botanical Tour in Mexico and California.—Mr. Drummond, of Belfast, is, we learn, about to proceed by New York to New Orleans, and thence to Mexico and California, on a botanical excursion. The perseverance and activity of this gentleman will ensure useful and important results. He expects to be absent for several years.

Dr. Edward Rüppell.—This enterprising and enthusiastic traveller left Frankfort in the early part of November last, to reside again in North Africa. He undertakes this journey, as he did his former one, entirely at his own cost; and having gone out with the intention of spending the remainder of his private fortune (about 3000*l.*) in this undertaking, he has made an arrangement with the town, which he has so much enriched by his ardour, that if he returns, they will allow him an annuity of 100*l.* The museum of Frankfort, entirely formed by the collections made during Dr. Rüppell's last residence in Africa, and by the articles obtained in exchange for his duplicates, certainly ranks third among the continental museums.

LITERARY NOVELTIES.

[Literary Gazette Weekly Advertisement, No. XI. March 12.]

LIST OF NEW BOOKS.

Lloyd on Light and Vision, 8vo. 1*5s.* bds.—Curtis's Treatise on the Ear, fifth edition, 8vo. 7*s.* 6*d.* bds.—Faith in Christ, post 8vo. 2*s.* 6*d.* bds.—Snowden's Moorish Queen, post 8vo. 6*s.* bds.—Smith's Description of his Patent Metallic Lining, &c. for Chimneys, royal 8vo. 4*s.* bds.—The Preacher, Vol. I. containing Sixty-six Sermons, 8vo. 7*s.* 6*d.* bds.—Dunbar's Greek and English Lexicon, 8vo. 1*l.* 5*s.* bds.—Noble's Orientalist, or Letters of a Rabbi, 8vo. 10*s.* 6*d.* bds.—Sothely's Homer's Iliad, 2 vols. 8vo. 1*2s.* bds.—Weber's Anatomical Plates, Parts I. and II. 1*l.* 1*s.* each.—Mataire's Greek Dialects, by Seager, 8vo. 9*s.* 6*d.* bds.—Beechey's Voyage to the Pacific, 2 vols. 4to. 4*s.* 4*s.* bds.—Sir John Sinclair's Correspondence, 2 vols. 8vo. 1*l.* 8*s.* bds.—Blishop Mant's Scriptural Narratives, 8vo. 1*3s.* bds.—Marshall's Byzantium, and other Poems, post 8vo. 4*s.* 6*d.* bds.—Sunday-School Memorials, 18mo. 3*s.* bds.—Mrs. Stevens' Comments, Vols. Wind variable, S.W. prevailing.

Except the 4th and 7th, generally overcast, with frequent rain, 5 of an inch.

Aurora Borealis.—On the evening of Monday, the 7th inst., the northern and western parts of our horizon were brilliantly illuminated from half-past eight to ten; the coruscations were but few, and of short duration.

Solar Spots.—The cluster of spots which has been on the sun's disc the past week is as large as any which have been observed here since the year 1817.

Edmonton.

CHARLES H. ADAMS.

TO CORRESPONDENTS.

Z. Z. Z.'s descriptions, though minute, do not enable us to distinguish the plant he mentions. If he will send us a specimen, with a note of the soil and situation in which it grew, we will give him the information he desires.

Sir,—Can you or any of your correspondents oblige me with the two Latin lines composed on the Princess Eboili, mistress to Philip II. of Spain? Both she and her son had lost the sight of one eye; the last two words were *cæcus amor*; and I think Herrick's translation ran thus:

"A half-blind boy, born of a half-blind mother,
Peerless for beauty, were compared to 'other.
Fair boy, give her thine eye, and she will prove
The Queen of Beauty, thou the God of Love." W.B.

We shall take the observations upon the power of conferring degrees, reported to have been given to the London University, into consideration.

ADVERTISEMENTS,

Admission, 1s.—Catalogue, 1s.

WILLIAM BARNARD, Keeper.

SCULPTURE.—Is now open, at No. 80,

Pall Mall, nearly opposite the British Institution, Mr. Laurence Macdonald's Exhibition of Sculpture, consisting of Colossal Groups, Statues, Busts of Eminent Men, &c. Open from Ten in the Morning till Five in the Evening.

Admission, One Shilling.

TO BE IMMEDIATELY DISPOSED

OF, a well-established and profitable Concern in the Book Trade, situated in a respectable and much-frequented Street in Bath. The House is large and commodious, and the Rent moderate. A large Stock of valuable New and Second-hand Books, in excellent condition; also Pictures, &c. to be disposed of by Valuation. The projected Bath College, and the great increase of Literary Institutions, &c. will no doubt improve the Profits of a House already favoured by liberal and extensive patronage. The motive which induces the present Proprietor to relinquish the Book Trade, is his obligation to enter into a Business extensively carried on by his Relations. As the House will be given up on Quarter Day next, immediate application should be made to the Proprietor, V. Appleby, 8, Bath Street. On inquiry, it will be found that the opportunity for entering into a profitable Business is such as rarely occurs, the present Proprietor being disposed, for the reasons above stated, to be as liberal as possible, and to afford satisfactory proofs of the prosperity of the concern. All letters to be post-paid.

ACADEMIE FRANCAISE, GREEN-

WICH.—MADAME MARTIN begs to announce that she has now Vacancies in her Establishment. From the whole of her Household being French, she presumes there are few such opportunities in this Country of acquiring a complete Knowledge of the Language, which, with the instruction she imparts to her Pupils in all sorts of French Fancy and Needle-work, she trusts will be more satisfactory to most Parents, than sending at present their Children abroad. The best Masters attend to give instruction in the other Branches of a completed Education.

For Reference, &c. Applications (post-paid) may be made to Mr. Morrison, Bookseller and Stationer, 25, Fenchurch Street.

THE late LIEUT.-COLONEL DENHAM,

the African Traveller. Colnagh, senior, Dominic Colnagh, and Co. Printers to their Majesties and the Royal Family, Pall Mall East, have the honour to inform their Friends and the Public, that they will shortly have ready for publication, a Portrait of the late Lieut.-Col. Denham, P.R.S. A Picture painted by T. Phillips, Esq. R.A. and engraved in Mezzotint on Steel, by Mr. Bromley, Jun. Proof, 11. 5s.: Prints, 12s.

A finished Proof may be now seen at the Publishers.

ROYAL FETE at HOLDERNESSE

HOUSE.—This splendid and unique Entertainment, which was given to the Royal Family and the Court, by the Marquess and Marchioness of Londonderry, on Wednesday night, is described in its minutest details, and from exclusive sources, in the Court Journal of the 11th inst. To give due effect to the description, the whole of the apartments are brought under view, as they appeared on this occasion; for which purpose, and also to afford scope for the details of the Queen's second Drawing Room, with particulars of the court dresses, an alphabetical list of the company present, &c. &c. Twenty-four additional Columns are given, without extra charge.

Orders received by all Booksellers and Newsmen, by whom it is forwarded, free of postage, to all Parts of the United Kingdom. Published by W. Thomas, 19, Catherine Street, Strand.

EDINBURGH REVIEW.—Advertisements,

Notices, &c. to be inserted in the general Advertising Sheet of No. 105 of the Edinburgh Review, are requested to be sent to Longman and Co. Paternoster Row, by Saturday, March 19; and Prospectuses, Catalogues, Bills, &c. to be stitched in the Number, not later than the 26th.

MUSIC.

MADAME VESTRIS'S NEW SONGS

in the GRENADIER.

1. They marched through the Town Nelson 2 0
2. Listen, dear Fanny! Serenade Ditto 2 0
3. The gay Savoyard Boy Donnadieu 2 0

• Sung in the new Barletta called the Grenadier, at the Royal Olympic Theatre, and nightly encored, written by T. H. Bayly, Esq.

Come to my Orange Bow, sung by Madame Vestris Nelson 2 0
Highland Minstrel Boy, sung by Mr. Wilson Barnett 2 0
Hope for the best T. H. Bayly 2 0

Hart's New Quadrilles.

Hart's Grenadier Quadrilles 3 0
Hart's Thirty-fourth Regt. from the Opera of Il Pirata 4 0
Hart's Thirty-third, or Adelaide Quadrilles 4 0
Hart's Royal Mazurka, as danced at Brighton 3 0
Hart's Royal Gallopedas, First and Second sets 4 0

Hart's celebrated Quadrilles, as Duets.

Hart's Thirty-second Set, from Massiniello 4 0
Hart's Thirty-fourth Set, from Il Baleno 4 0
Hart's Thirtieth Set, from Macbeth 4 0

DEPENDENCE.

Price 7s. In cloth.

By the author of "Little Sophy," &c. This work was written under circumstances of peculiar interest to the author; and she hopes that she may confidently invite the attention of the young of her own sex, whose station in life place them above the yoke of dependence, and who may perhaps only know how to judge of such trials from the pages of fiction. London: George Gower and Son, 3, St. Paul's Churchyard; and H. Mosley and Son, Derby.

Of whom may be had, by the same Author,

Little Sophy; a true Story. 3d edition,

1s. 6d. cloth.

Recollections of a Beloved Sister. 2d edition,

price 8s. 6d. boards.

With Woodcuts, 2 vols. post 8vo. 16s.

A YEAR IN SPAIN.

By a YOUNG AMERICAN.

"Nothing is easier and more common than to fill a book of travels with erudite information, the after glancing and gathering of the closet; while nothing is more difficult and rare than to sketch with truth and vivacity those familiar scenes of life, and those groups and characters by the way-side, which place a country and its people immediately before our eyes, and make us the companions of its travellers. We trust that the extracts we have furnished will show the author to possess this talent in no ordinary degree."—Quarterly Review, No. LXXXVIII.

Latest published.

A Chronicle of the Conquest of Granada, by

Washington Irving.

2 vols. 8vo. 8s.

John Murray, Albemarle Street.

Post 8vo. 2s.

THE MODERN HUDIBRAS; or, the

Quixote of Reform. In Two Cantos.

John Murray, Albemarle Street.

LIEUT.-COLONEL MATTHEW

STEWART'S REMARKS on the PRESENT STATE

of AFFAIRS.

"The author is, indeed, a pure Whig—but it is on this very account that we are anxious to give his tract whatever additional circulation our testimony may be sufficient to command. He arrives at our conclusion, and he sees arguments which, though we could not use them, may in many quarters be considered better than ours. Colonel Stewart, the very able son of a most able father, (the celebrated Professor of Moral Philosophy), is a distant and calm observer; these fierce struggles in the world of politics. This essay will be read to us and by every man who once begins it."—Quarterly Review, just published.

John Murray, Albemarle Street.

English Translations of the Classics.

1st March was published, 4s. 6d.

MURPHY'S TRANSLATION OF

TACITUS, Vol. V.; being No. 18 of Valpy's Classical Library.

No. XVI. will contain Theophrastus, with Fifty fine Characteristic Portraits.

No. XVII. and XVIII. will comprise Horace,

in which will be introduced Translations of different Parts of that Author, from the Pens of Dryden, Pope, Swift, Milton, Johnson, Byron, &c. and some of the most eminent Poets of the present day; with a Portrait of Horace, and a Biographical Sketch. Juvenal and Persius will appear together on the 1st of June.

The Fifteen first Numbers of the Series contain—Demosthenes, Sallust, Xenophon, Herodotus, Virgil, Pindar, Anacreon, and Tacitus. Any Author may be purchased separately, at 4s. 6d. per volume.

"If you desire your son, though no great scholar, to read and reflect, it is your duty to place two hands the best translations of the best classic authors."—Dr. J. Valpy.

Printed and published by A. J. Valpy, M.A. Red Lion Court; and sold by all Booksellers.

Family Library.

Illustrated with highly finished Engravings, from the Sketches of Prout, and Woodcuts from Designs of Titian,

FAMILY LIBRARY, No. XX.; being

Sketches from Venetian History. Vol. I.

Mr. Murray's Family Library—a title which, from the valuable and entertaining matter the collection contains, as well as from the careful style of its execution, it well deserves. No family, indeed, in which there are children to be brought up, ought to be without this Library, as it furnishes the readiest resources for that education which ought to accompany or succeed that of the boarding-school or the academy, and is infinitely more conducive than either to the cultivation of the intellect."—Monthly Review, Feb. 1831.

Volumes now published, &c. each—

1. and 2. Life of Buonaparte.
3. Alexander the Great.
- 4, 10, 12, and 19. British Artists.
- 5, 6, and 9. History of the Jews.
7. Insects.
8. Court and Camp of Buonaparte.
11. Irving's Columbus.
12. Southern's Nelson.
13. British Physicians.
14. British India.
15. Democritus and Whittcraft, by Sir Walter Scott.
17. Life and Travels of Bruce.
18. Irving's Companions of Columbus.

The Family Dramatists, Nos. I. and II., being

Vols. I. and II. of the Works of Philip Massinger, illustrated with Explanatory Notes; and adapted to Family reading, by the omission of exceptional passages.

John Murray, Albemarle Street.

In 1 thick vol. third edition, much enlarged and improved, 18s.

MODERN DOMESTIC MEDICINE; or,

a Popular Treatise, exhibiting the Nature, Symptoms, Causes, and most efficacious Treatment of all Diseases, including also a copious Collection of approved Prescriptions, Medical Management of Children, Rules of Diet, Virtues and Doses of all Medicines, &c. The whole forming a clear and comprehensive Medical Guide for the Use of the Clergy, Families, and Invalids.

By T. J. GRAHAM, M.D. &c.

"We conscientiously recommend it. It is very far above the celebrated Buchan's; and we shall preserve the volume as the advice of an invaluable friend, to which we can refer in the hour of need, without any doubt of being benefited by its wisdom."—Literary Chronicle.

"It is the opinion of a respectable physician, well known in our connexion, it is enriched with much of all that modern practice has ascertained to be valuable, and is not only incomparably superior to Buchan's, but also to every similar work in our language."—Western Magazine.

"It is altogether deserving of permanent popularity."—London Weekly Review.

"It is one of the very best and most useful books published in modern times."—Monthly Observer.

Published by Simpkin and Marshall, London; and sold by all Booksellers.

Also, by the same Author, 9d. edition, revised and enlarged, price 8d.

2. A Treatise on Indigestion; illustrating

the Symptoms, Varieties, Causes, and correct Treatment of the prevailing Disorders of the Stomach and Liver; with Practical Observations on some Painful Complaints originating in those disorders, as Tic Douloureux, Gout, Fulness of Blood in the Head, &c.

"We sincerely recommend it, and have long been convinced that such a work was imperatively called for."—London Medical Journal.

"It is very evidently the result of close attention to, and deep experience in the subject. Mr. Abernethy speaks of it in terms of high praise."—British Age, Jan. 1830.

In 3 vols. price 11s. bound in cloth, dedicated, by permission, to the Queen's Most Gracious Majesty, and patronised by the Royal Highnesses the Duke of Cambridge, the Duchess of Kent, the Princess Augusta, the Duchess of Gloucester, the Princess Sophia, and Prince George of Cambridge.

New Burlington Street.
STANDARD NOVELS.—A Companion to the Waverley Novels.

Messrs. Colburn and Bentley beg to acquaint the public, that it is their intention to produce cheap editions of such novels and romances, written subsequently to the time of Fielding and Smollett, as have, like the productions of those great delineators of nature and manners, taken their rank among English classics. The vast number of editions which have appeared, of the novels of Richardson, De Foe, Fielding, Smollett, Sterne, Goldsmith, and others, demonstrates the strong and universal hold which such vivid exhibitions of life maintain on the curiosity, and, it might without exaggeration be added, on the affection, of readers of every age and every class; for not only is entertainment, in all the various moods of comedy and tragedy, provided in the pages of such fiction, but he who reads them attentively may acquire, without the bitterness and the danger of experience, that knowledge of his fellow-creatures which, but for such aid, could, in the majority of cases, only be attained at a time of life when it would be too late to turn it to account.

It has been truly observed that well-wrought novels "take their rank by the side of reality, and are appealed to as evidence in all questions concerning man." It follows, therefore, that as manners, character, and character (which often depends on manners), vary, the "mirror held up to nature" must change also; and that, valuable as the older fictions are, it is necessary to study also those which have succeeded them, and which put in possession of instruction which may be rendered available in that "which before us lies in daily life," and which has been designated by a great authority, as "the private wisdom."
To enable the great number of the public to enjoy these works, the possession of which has hitherto been chiefly confined to the wealthier classes, is the object of the present undertaking, for the accomplishment of which the Proprietors have within their power opportunities which they believe are not at the command of any other publishers.

The first Number, published on the 1st of March, contains the whole of the Pilot, by Mr. Cooper. The second Number, to be published on the 1st of April, will contain the whole of Godwin's celebrated story of Caleb Williams.

The volumes will range in the library with the Waverley Series, but they will contain a much greater quantity of matter—a quantity indeed equal to two, and sometimes to three ordinary volumes. A number will be published on the 1st of every month, beautifully printed and illustrated with engravings, from designs by eminent artists.

The Proprietors think it necessary to add, that a cheap and uniform edition of the entire works of the celebrated Author of the "Pilot" can only be printed in the present series of Standard Novels; inasmuch as the copyrights of the latter works of Mr. Cooper are the exclusive property of Messrs. Colburn and Bentley.

Orders received at every Bookseller's throughout the Kingdom, where also Prospectuses and Specimens of the Plates may be seen.

In a few days,
THE KING'S SECRET
will come out! 3 vols.

"Give it an understanding, but no tongue."—Shakespeare.

Just published,
1. The Anatomy of Society. By J. A. St. John. In 3 vols.

2. The Way of the World. By the Author of "De Lisle," &c. 8 vols.

"We prefer this to the author's former works."—Lit. Gaz.
"The author of De Lisle possesses profound powers of thought, with a closeness and accuracy of observation of a very extraordinary kind."—Times.

3. The Game of Life. In 2 vols.

"Strong and vivid pictures of actual life."—Literary Gazette.

4. Tales of the Five Senses. Edited by the Author of the "Collegians," &c. 1 vol.

"A valuable and entertaining volume."—University Magazine.

5. Lives of the Italian Poets, by the Rev. Henry Steeble, 3 vols.

"The high merit of these volumes will recommend them."—Literary Gazette.

6. Romance of History—France. From the time of Charlemagne to Louis XIV. inclusive. 3 vols. A 2d edition is now ready. By Leitch Ritchie.

Printed for Edward Bull, New Public Subscription Library, 36, Holles Street, Cavendish Square.

First of April will commence, in Monthly Numbers, 5s. 6d.
EPITOME of ENGLISH LITERATURE; or, a Concentration of the matter of Standard English Authors, on a Plan entirely new; with Portraits, Biographical Sketches, &c.

Edited and printed under the superintendence of A. J. Valpy, M.A. formerly Fellow of Pem. Coll. Oxford.

"Were all books reduced to their quintessence, many a bulky author would make his appearance in a pamphlet; there would be such a thing as a folio, and the works of an age would be contained on a few shelves."—Addison.

Much as we owe to the invention of printing, its good is not entirely without alloy. From the facilities it presents to the rapid march of mind, books are multiplied as if by magic; but at the same time the swelling works of each successive age are the great want of leisure to read them, rapidly displaced by literature of a lighter cast, whose aim it is "to play round the heart, but never reach the head."

To divert in part the interest felt for such productions, it is intended to publish, in a concentrated form, a series of standard English Authors of whose work the present generation know little, and the rising youth must know less, although the names, at least, of such writers, are "familiar in our mouths as household words"; and the information they convey, suited to all times, places, and conditions of men, is clothed in language which, of necessity remained stationary, whilst modes of thinking and writing have insensibly changed.

But though powerful in mind and rich in matter are the writers of England's proudest period, still they are all deficient in the one thing needful—brevity; and thus the very points on which they glimmer in their own days, have led to their present partial neglect. Ever more afraid of saying too little than too much, they have imposed on posterity the task of pruning luxuriances and removing blemishes, by the rejection of what is superfluous in matter and quaint in style; but without the double advantage on our part of retaining all that is useful, and of imparting a new interest to it by the system of concentration.

Of the value of such a principle, the best proof is given by the unmitigated and inimitable authors of Greece and Rome. Varied as their works are in subject and style, they all unite in the leading point—to give the maximum of information in the minimum of space; and have thus been able to become independent of their intrinsic value, to outlive not only the darker ages, but to throw a lustre even on more enlightened times.

From the limits of a prospectus, it is impossible to state the precise nature of the plan intended to be pursued; suffice it to observe, that history no facts, and in philosophy no reasoning, will be omitted or distorted, so as to render a reference to the original author requisite; and thus the youth especially of both sexes may become perfectly acquainted with authors repulsive from their bulk alone, at a comparatively little cost of time as at present.

The series will be confined to the popular productions of writers in prose, and the following Authors will be first selected:—
Historical.—Burnet, Clarendon, Gibbon, Hume, Rollin, Robertson.

Philosophical.—Bacon, Locke, Paley.

Miscellaneous.—Addison, Goldsmith, Johnson, Milton, Swift. The work will be printed in small 8vo. after the manner of Sir Walter Scott's novels, in monthly volumes, averaging 350 pages of handsome letterpress, price 5s. 6d.; and any author may be purchased separately, at a small advance on price.

No. I. Paley's Moral Philosophy, with a Portrait.

No. II. Paley's Evidences of Christianity, and Locke on the Human Understanding, with a Portrait.

The Historical and Miscellaneous Series will be ready for publication in the spring, commencing with Clarendon, Gibbon, Rollin, Addison, Johnson, &c.

Orders for this work may be given to all Booksellers in the United Kingdom.

On Thursday, 9th March, will be published, in 3 vols. post 8vo.

DESTINY; or, the Chief's Daughter. A Tale.

By the Author of "Marriage," and the "Inheritance." Printed for Robert Cadell, Edinburgh; and Whittaker and Co. London.

Who have very nearly ready,

Fragments of Voyages and Travels, including Anecdotes of a Naval Life, chiefly for the Use of Young Persons. By Captain Basil Hall, R.N. F.R.S. 2 small vols.

LONDON: Published every Saturday, by W. A. SCRIPPS, at the LITERARY GAZETTE OFFICE, 7, Wellington Street, Waterloo Bridge, Strand, and 13, South Moulton Street, Oxford Street, sold by J. Chapman, 92, Regent Exchange; E. Marlborough, Ave Maria Lane; Ludgate Hill; A. Black, Edinburgh; Smith and Son, D. Robertson, and Atkinson and Co. Glasgow; and J. Cunningham, Dublin.—Agent for America, O. Rich, 15, Red Lion Square, London.
J. MOYES, Took's Court, Chancery Lane.

THE LONDON LITERARY GAZETTE;

AND

Journal of Belles Lettres, Arts, Sciences, &c.

This Journal is supplied Weekly, or Monthly, by the principal Booksellers and Newsmen, throughout the Kingdom; but to those who may desire its immediate transmission, by post, we recommend the LITERARY GAZETTE printed on stamped paper, price One Shilling.

No. 739.

SATURDAY, MARCH 19, 1831.

PRICE 8d.

REVIEW OF NEW BOOKS.

Narrative of a Journey across the Balcans, by the two Passes of Selimno and Pravadi; also of a Visit to Azani, and other newly discovered Ruins in Asia Minor, in the Years 1829-30. By Major the Hon. George Keppel, F.S.A. 2 vols. 8vo. Colburn and Bentley.

DESIROUS of witnessing the Turkish war, and forming his own opinion of that contest, Major Keppel resolved to travel to the seat of action in 1829; but the Russian victories anticipated his purpose; and in the month of June, when he set out, he could only proceed to visit the country where the struggle had been, and see its effects as a past history. Journeying through France, Switzerland, and Italy, he embarked at Otranto for Corfu; and thence, taking various parts of Greece in his route, made his way, principally by sea, to Constantinople. After remaining in that city for a while, he pursued his course to Adrianople, and made a circuit including the Balcan, Derbent, Shumla, Bourgas, Chorli, &c. and so back to the Turkish capital. He next performed a tour in Asia Minor, and inspected some fine remains of antiquity, of which an account is given; but we must go through the work in order, and therefore begin with the beginning.

At Naples, the author speaks of a Prussian general and his staff. "He had come round from Berlin, and was going on a special mission to Constantinople from the King of Prussia, to signify the emperor of Russia's desire of peace. This, of course, was before the successes of the great autocrat. I heard of the general at Constantinople, but did not meet him: he arrived there on the 6th of August. He is a corpulent man, rather advanced in years. On his first visit to the Reis Effendi, or Turkish foreign secretary, that minister said to him: 'Well, general, what proposal from the emperor have you to lay before us with regard to peace?' The general replied, that he was merely instructed to assure the Porte that the emperor was pacifically inclined. 'Upon my word, then, general,' rejoined the Reis Effendi, 'I wonder that a man of your age and corpulence should have undertaken so long and fatiguing a journey on so trifling an errand, seeing that we have had the same assurance on the faith of nearly every ambassador.'

Major Keppel is not only a very intelligent, but a very lively and agreeable companion. He tells his story with admirable ease; and his narrative is altogether so amusing, that the reader is quite carried away by the manner as well as the matter. Interesting information, entertaining anecdote, and clear description, every page, and render these volumes an extremely pleasant contribution to the class of books. This we are sure will be felt from the extracts which we shall select from many miscellaneous points, without caring to trace the author from post to post on his journey. The

sitting of the Greek parliament at Argos is a curious picture of a legislature.

"The assembly (says the Major) was sitting when we arrived: they had commenced their deliberations at daylight, and had been called together by the beat of drum. The place of meeting was the ancient theatre, which (excepting those at Sparta and Iania,) is the largest in European Greece. A temporary building had been erected, forming a semicircular succession of benches, on the site of the *scena*, and facing the *cavea*. This structure had no roof; but, like the most primitive Greek theatres, was covered in with boughs of trees. The summons to parliament by beat of drum had appeared rather too military for our fastidious notions of free discussion; but a more decisive mark of military interference here met our view. Like many other ancient theatres, this one at Argos is excavated on a hill: on the brow, at the upper benches of the *cavea*, were five pickets of *palikari*, so posted as to be able to fire down upon the assembled senators in case of emergency. There was, however, little chance of their services being required; for, by the wise arrangements of the president, the assembly was disposed to be nearly unanimous in complying with any wish of his excellency. The members present were about two hundred in number, and were for the most part dressed in the Albanian costume, which resembles in so many respects the ancient dress, as always to bring to mind classical recollections; indeed, the whole scene was likely to produce this effect, for the orators spoke in the language nearly Hellenic, and with abuse truly Homeric, the subject being one on which, in every age, this nation has always been most eloquent—the division of spoil. A sum of money had been granted to the troops who had taken a part in the late war, and the present meeting was to decide upon the mode in which it was to be divided; hence arose an animated discussion, in which the inhabitants of Peloponnesus, and other people of Greece, each insisted on their respective claims; and expressions of satisfaction from the one side, and of discontent from the other, assailed each orator in his turn. Amongst the speakers this morning was Colocotroni, once a clamorous patriot, but now a government man, in consideration (as report whispers) of the sum of eighteen thousand dollars. This man has played so conspicuous a part in the late revolution, that I could not help remembering his name, though, if all who had yielded to the silver persuasion of the president were to be enumerated, it would be necessary to go through the list of nearly the whole parliament."

They seem to need a Reform! Off the Trojan shore our countryman dined on board the Russian flag-ship, and he observes:

"The admiral, Monsieur Ricord, spoke very good English, having served six years in our navy, under Captain Parker: thus, of the three senior officers in the Russian squadron, the first, Count Heyden, is a Dutchman, and the two others have been indebted to us for

their education. The squadron in the Black Sea is commanded by an Englishman, Admiral (lately made Count) Greig; and there are no fewer than seven other natives of Great Britain who are Russian admirals on active service, namely, Admiral Greig, son of the commander-in-chief, and (I believe) second in command to him; Admirals Cobley and Baillie, in the Black Sea; and Admirals Hamilton, Crown, Brown, and Chandler, in the Baltic. Admiral Mercer, another Englishman, died lately at Sevastopol. In other departments there are, Sir James Wylie, head of the medical military establishment; Sir William Creighton, physician to the emperor; Dr. Leighton, physician-in-chief to the navy; General Wilson, director of Colpene iron-works and Alexandersky manufactory; General Forde, chief of the arsenals; and Mr. Venning, superintendent of prisons. To these must be added Captain Sherwood, who discovered the intended mutiny and revolt of 1825, and saved the lives of the present imperial family."

The following anecdote is illustrative of character.

"Near Rodosto, we saw a young soldier mounted on a handsome charger, the reins of which were held by an old Turk with a venerable white beard. They were father and son: the younger man was known to John. His family were rich, and lived near the Asiatic castle of the Dardanelles. John asked him where he had been; he replied, 'Military ardour inspired me with a wish to join my brave comrades in arms; but God's providence put fear into my heart, and so I returned!'

But we hasten forward to Constantinople, many of the author's remarks on which are extremely interesting.

"A ride round the walls of Constantinople is delightful. They are very curious, and remarkably strong. There are six grand entrances, of which, however, little remains except the general plan of the roads leading to them. They afford superb specimens of antiquity; the ivy grows over them in the most luxuriant manner imaginable. You are shewn the spot where the last Greek emperor fell, and where the town was stormed. Not far from this place are the tombs of the famous rebel Ali Pasha of Iania, and of his sons, who were all beheaded a few years ago. Our peregrination of the day was performed without our encountering the slightest molestation. Since the destruction of the janisaries, no Turk, except in government employ, is allowed to wear arms; and a Frank can go all over Constantinople, not only without danger, but without insult. Crossing one of the streets, we observed the ground smeared with blood. It was the spot where a man had been lately executed: he was one of some thousands who had been put to death a few days before my arrival. As soon as the advance of the Russians had become generally known, the disaffected spirit which had almost lain dormant since the destruction of the janisaries, broke out, not only in European Turkey, but throughout the Afri-

can and Asiatic dominions of the sultan; and the news of revolt and discontent in the remote provinces were received at a time when succours from those very parts were most required. In the beginning of August, several attempts had been made to set fire to Constantinople; and the sultan's best troops, who had been previously destined to reinforce the army opposed in the field against the Russians, were employed in preserving peace in the capital. Desertions from the regular army were numerous; and, as I mentioned before, fifteen hundred men abandoned their colours from the *corps d'armée*, encamped at Bayukdere, and about to be called out on active service. These deserters, together with several irregular troops, committed so many excesses, that the neighbourhood of Constantinople became quite insecure, and travellers could not proceed without an escort. On the 12th of August, the *sanjak sherif*, or sacred standard, was taken to Ramas Chiflik, the principal Turkish barrack. Thither also the sultan went, and made it his future residence. A very few days afterwards, a disturbance took place in the barracks, in which thirty lives were lost. Later in the same month, a regular conspiracy was discovered; the objects of which were, to overturn the sultan's government, to re-establish the order of janisaries, to burn the capital, and to retire into Asia Minor. The ramifications of this plot were very extensive. Most of the Asiatics, with the army at Shumla, were implicated. It was discovered by the conspirators having consulted the astrologers to name a propitious day for the accomplishment of their design. Some day late in August was fixed upon for the purpose. In the meanwhile the astrologers were arrested, and on being put to the torture, confessed the whole. I was told by Mustapha, a kavass in the British service, that the next Friday, after the sultan had become acquainted with the conspiracy, he went, with more than usual pomp, to the mosque, and was attended by a large band of music. Returning from prayers, persons implicated in the conspiracy were seized, made to kneel down, and executed on the spot. The first executions took place on board the fleet, the capitan pasha putting to death several of his own personal attendants. Soon after, the Nasir of Buyukdere was executed, and his head placed on one of the gates of the seraglio. Subsequently, the sultan devolved the office of crushing the rebellion upon the seraskier pasha, or commander-in-chief of the army; a man of about seventy-six years of age, and a great favourite with his sublime highness. This man adopted the expedient which had been acted upon by his imperial master a few years before,—that of extermination. From four to five persons a-day were beheaded and exposed in the streets; and from fifty to a hundred were every night strangled, and their bodies thrown into the Bosphorus, at the seven towers. From three to four thousand persons were put to death. The bodies exposed in the street were seen by the English travellers who were in Constantinople at the time. Lord Dunlop told me, that amongst the corpses, he stumbled upon that of a coffee-house keeper, whose house he had once been in. It was suspected of being the rendezvous of the disaffected: it had been rased to the ground, and its owner beheaded. On another occasion, he came to the spot where a fine athletic young man had been put to death a few minutes before. The head, which had been very awkwardly severed, was placed, according to custom, under the arm. Near the body was the unhappy widow of the deceased,

the only person who dared to shew any sympathy in his fate. Other persons either passed on, or stopped for a moment to read the *yafsa*, or sentence of death. Mr. Slade, a lieutenant in the navy, was accidentally present at an execution, which took place on the 5th of September, two days before I came to Constantinople. He was entering from the fish-market, which terminates with the custom-house, and about to turn in that direction, when he remarked a crowd of persons, all looking towards the opposite end of the street. He now perceived a guard of about twenty men advancing towards him. Curious to know what it might mean, he remained where he was, at the crossing of the two streets. When the guard had arrived there, it halted, and the officer made signs to the crowd to fall back, upon which two men advanced from the guard—the executioner and the victim, the latter having his hands tied behind him, the former armed with a *yatagan*. So firm and undaunted was the demeanour of the condemned man, that had not his hands been tied, there was nothing to indicate his unhappy character. With the same unshaken determination, he presently knelt down and submitted his head and neck to be prepared by the executioner for the blow, by removing his turban and cap, and feeling the back of the neck for a good place to strike. When this was done, and the executioner had read over the *yafsa* under which he was condemned, he made a short prayer to Mahomet in a loud and firm tone of voice; and turning to the executioner, he said he was ready; upon which, with a single blow of the *yatagan*, the head was severed from the body: it rolled two or three feet, while the trunk, instantly lifeless and prostrate, emitted two copious streams of blood. In the mean time the mob and guard disappeared; the executioner quietly wiped his *yatagan* on the clothes of the deceased, sheathed it, laid the body on its back, the head under the arm, and the *yafsa* on the breast. Several Greeks, Armenians, and Jews, were executed at this period. Their bodies are disposed of differently from the Mahometans. They are laid upon their bellies, and instead of the heads being placed under the arms, they are put between the legs. Some women were also put to death; but as the Turk never loses sight of the decorum due to the sex, even after death, their bodies were placed in a horse-hair sack, and in this manner exposed, for the sake of example. I have mentioned the *yafsa*, or sentence of death. The following is a translation of one that was taken from the breast of a man executed the 6th of September, and may serve as a specimen of Turkish criminal jurisprudence. It will be observed, that the unfortunate sufferer was put to death because another man addressed seditious language to him. 'Achmet, kiaya (chief) of the corporation of merchants dealing in articles of luxury at Constantinople. This wretch obtained, some time ago, through the munificence of his highness, the office of kiaya of this corporation. Instead of shewing gratitude for the manifold benefits he had received; instead of thanking God in the five prayers; instead of praying night and day with his family for his highness and for the Mussulman nation, in remembrance of the favours by which he had hitherto been loaded; instead of attending to his own business; instead of abstaining from criticising business which did not concern him; instead of living quietly, and being more than any other of the like employment attached to government, as

compelled him;—this man not only omitted making any of these reflections, but made use of seditious language, saying that the seraskier pasha, or seraskier capissi, had been torn in pieces; that this and that thing had been done. It is in this manner that he had the audacity to cause to be circulated false intelligence, conduct tending to spread alarm amongst Mahometan people. The fact being alleged, and Achmet being interrogated on the subject, could not deny it. He only maintained that it was not he who had said it, but Abdi, a cavass of the imperial divan, living in the quarter called Feironz-Aga. Abdi was summoned to appear, who being confronted with Achmet, he also has been unable to deny it. The boldness of their infamous conduct, and of the language they have held on things which did not concern them, proves that these men are ungrateful wretches, traitors who ought to be made to disappear; and it is thus deemed necessary to execute upon them the penal laws, so that good order may be maintained. In consequence, the traitor, Abdi Cavass, has been executed in another place, and the robber, Achmet, has undergone the punishment here, so that he might seem as an example.'

"In lounging along the shores of the Bosphorus with Captain Lyons, Mr. Grovenor, and Mr. Villiers, we came to a village where there were four men hanging. They had been Greeks, in government employ as journeyman bakers, in the marine storehouse. Their crime was murdering one of their companions, having first robbed him of eleven hundred piasters. We were not present at the execution, which had taken place a short time before. Each man was suspended from a separate gallows. The implement of execution was of the rudest description. Three posts of unequal size, as if they had been found by chance on the spot, had been placed on, not in the ground, and meeting at the top, formed a triangle like that from which weights are suspended in England. The rope by which the culprit was hanging was rove through a ring at the top of the triangle, and twisted in a slovenly manner round one of the posts. The perpendicular of the triangle was seven feet, and the criminals were hanging so low that their feet were within a few inches of the ground; so that when we approached, we found ourselves face to face with the bodies. Their appearance was different from what I had expected; the countenances were tranquil, and, except a slight protrusion of the tongue between the teeth, there was no distortion in the features. The eyes of one of the bodies were open, and we could almost imagine that they were regarding us. The countenance of this man was not bad, while that of the corpse beside him was the vilest I ever remember to have seen. Over each body a sentry was placed, who willingly answered every question that was put to him respecting the culprits. We were told that the bodies would be exposed for two days, and then thrown into the Bosphorus. The mode in which they are hanged is, by one man pulling the rope, while another clings with his whole weight to the body until life is extinct."

Having engaged Lord Dunlop as a fellow-traveller, Major K. departed for Adrianople, to be guided by circumstances as to their future route, as peace had not yet been ratified, and much uncertainty prevailed.

But at Adrianople we also must rest.

Oxford: a Poem. By Robert Montgomery, of Linc. Coll. Oxon., author of the "Omnipresence of the Deity," "Satan," &c. Post 8vo. pp. 258. London, 1831, Whittaker and Co.; Edinburgh, Blackwood.

We have paused upon this volume, for we felt great reluctance to throw a shadow upon the youthful talent whence it has sprung; but upon giving it our best consideration, we are bound by truth to say that we do not think it worthy of the author. There is a mediocrity running through the whole, which shews that the subject rarely or never touched the imagination of the writer; and there are a number of faults not redeemed by a like number of the wanted merits which have hitherto not only excited hopes, but displayed existing genius, in Mr. Montgomery's compositions. As an accession to his fame, therefore, we hold *Oxford* to be a failure; though it exhibits a mind yearning after the good and great, and teaches us to esteem the individual, while we regret to withhold our praise from the poet.

Having thus candidly stated our opinion, it is due to an author who has fairly won so much of public attention and admiration, as well as to our readers and ourselves, briefly to support it by a few remarks and quotations. In a general point of view, the poem is obnoxious to criticism—for its iteration of the same ideas, for its blemishes in structure and style, for its invention of new words and misapplication of epithets, for its offences against taste, for its carelessness, and for its egotism. These are grave charges; but we are sorry to say, a perusal of the work must substantiate them all.

With regard to the constant iteration of the same ideas, it is only necessary to refer, in proof, to the repetition of the thoughts on *mind*, on mental qualities, and on intellect, which are really harped upon till we are fatigued with the strain. The *grand* and *grandeur* form another string, the length and identity of which might be estimated from the recurrence of these words in almost every third page, from the poor opening couplet, throughout the piece.

"What makes the glory of a mighty land,
Her people famous, and her his'try grand!" p. 1.
"In low'ry dimness, gothic, vast, or grand,
Behold her palaces of learning stand!" p. 14.
"While Genius moulded with a master hand
The primal elements of pure and grand." p. 19.
"Left ravish'd piles all desolately grand,
And breath'd a sterner spirit o'er the land." p. 30.
"All Souls, with central tow'rs superbly grand;
But see! the clouds are born,—they break,—expand." p. 34.

"What'er of good and glorious, learn'd, or grand,
Delighted ages and adorn'd the land." p. 41.
"Here Sydney dreamt, Marcellus of his land,
Whom poets lov'd, and queens admitted grand." p. 58.
"No scene was glorious, and no object grand,—
But there be worshipp'd an Almighty hand." p. 90.

Such are the rhymes in the first Part; and it would be curious to count all the combinations of *grand*, *grandeur*, *grandest*, *grander*, *grandly*, &c. which are to be found in other lines besides these at their terminations.

Of the faults in structure and style, our specimens on different heads will be sufficient testimony, without our going at length into examples. The frequent omission of the articles, the disregard of mood and tense, and, occasionally, obscurity, or rather, perhaps, the absolute want of meaning, generated by these defects, will strike every judge of poetical composition. Take one short instance.

"The sage of England sat in this lone room:
Yet, well may Fancy say, you evening fire
Behold him seated; and when moods inspire,

As Sorrow droop'd, or Hope her wings unfurl'd,
His spirit hover through the varied world,
Of life and conduct, fortune, truth, or fate,
His future glory, and his present state."

The verbs here are in fine confusion.

Of new-coined words, we disapprove of reposeful, museful, rewardless, mellowingly, &c.; in their places they do not express what the writer intends: and the same remark applies to the epithets and other phrases which occur but too often.—*Ex. gr.*

"Then vainly let the pow'rless sophist frown,
To hide one ray of Oxford's fair renown,
Or quote some verse to vindicate his cause,
Of scornful meaning at her mental laws."

What is intended by mental laws—laws of mind?

"With sages whom historic lovers read."

Historic lovers, for lovers of history. Speaking of the late King's visit, Mr. M. says,

"With head uncover'd, royally he smiles,
And every heart that noble face beguiles."

Of Dr. Johnson:

"The dignified and sage,
The noblest honour of a noble age;
Whose mien and manners, though of graceless kind,
Were all apart from his heroic mind."

Now we will venture to say that the author did not use the words "beguiles" and "graceless" according to their common and proper acceptation in the English language. In the following line the word "menial" is also misused; and the whole line itself is a specimen of the alliteration and antithesis which prevail throughout the poem:—

"The mouldy cellar, and the mental stall."

A few pages on, we find the epithet "radiant" given to the tiles of Oxford roofs: but enough of these.

The offences against taste, and the egotism, to which we have alluded, are to be found in an episode about the little literary world of London (page 80 *et seq.*); in several descriptions of the author's young poetical aspirations, superior mental enjoyments, and conflicts with envious critics,—matters which have little to do with Oxford,—but on which we abstain from dilating, and only give a small space to the last of our complaints in samples of carelessness.

"Rush'd on thy fate with desolating sway,
And flung a desert o'er thy darken'd way!"

"All are not fram'd alike: love, hope, and youth,
That guard our age, and glorify our youth."

We trust Mr. M. does not consider these to be justifiable rhymes. Again:

"Truth, taste, and sense, through all he does pervades,"
is very bad: and,

"But rarely fraught
"With something sprung from self-created thought,"

is no better. We annex a passage, without further comment than the italic letter to mark what we think very indifferent, both in taste and expression.

"Which more offends? The bigot who can read
No volume from the dust of ages freed;
Or he who owns no intellectual grace,
But makes a cargo of the human race,
And values man like produce from the ground,—
'Tis hard to say, yet both, alas! are found.
The dark idolater of ancient time,
And nascent epure in prose or rhyme,
The musty pedant with an owl's eye,
Who pipes an elegy o'er days gone by,—
Oh! still from Oxford be the race remov'd,
And nobler far her gifted scions prov'd.
What soul so vacant, so profoundly dull,
What brain so wither'd in a woful skull,
As his who dungeon'd in the gloom of old,
From all the light of living mind withheld,
Can deem it half an intellectual shame
To glow at Milton's worth, or Shakespeare's name!"

* See also:

"For thus, the spirit on her wing sublime,
Above the reach of earth and roar of time,
In that deep energy may proudly share,
Which forms'd worlds, and all that formeth there!"

Who hath not smiled at some affected bore
That drives nothing but—the days of yore."

Again:

"To humble worth a consecration lend,
That proves for lost renown sublime amend."

The Freshman!

"And now the walk of wonder through the town
In the first flutter of a virgin gown!"

This is ridiculous; and having told that some of the notes are not more to our liking, we shall now conclude with the more grateful task of selecting some of the beauties, which serve to counterbalance these blemishes. We have said that an amiable and virtuous feeling pervades the poem: the following will corroborate the observation:

"Oh! none whose souls have felt a mighty name
Thrill to their centre with its sound of fame;
Whose hearts have warm'd at wisdom, truth, or worth,
And all that makes the heaven we meet on earth,
Can tread the ground by genius often trod,
Nor feel a nature more akin to God!"

"Oh! little think they, how sublimely pure,
In godlike state above the world secure,
That earthless nature which thy genius call;
In vain the tides of circumstance appeal,—
Though clouds repress, and darkness we detain,
The soul renounces, and is herself again!
Go, ask of ages, what made dungeons bright,
Vile sufferance sweet, and danger a delight,
Created thunders to o'erawe the sky,
Unloos'd storms, and let the whirlwinds fly,
Yea, forced the universe to feel her nod,
And dar'd a while to imitate a God!
'Twas spirit, independently sublime,—
The king of nature, and the Lord of time."

The country curate is sweetly delineated with a brief touch.

"On such, perchance, renown may never beam,
Though oft it glitter'd in some college dream;
But theirs the fame no worldly scenes supply,
Who teach us how to live, and how to die."

"Parochial cares his cultur'd mind employ,
Domestic life, and intellectual joy.
The old men cry,—A blessing on his head!
And angels meet him at the dying bed."

The last exquisite line is applied to Heber. We now cite another fine passage.

"The day is earth, but holy night is heaven!
To her a solitude of soul is given,
Within whose depth, how beautiful to dream,
And fondly be, what others vainly seem!
Oh! 'tis an hour of consecrated night,
For earth's immortals have ador'd the night;
In song or vision yielding up the soul
To the deep grandeur of her still control.
My own lov'd hour! there comes no hour like thee,
No world so glorious as thou form'st for me!
The fever'd ocean of eventful day,
To waveless nothing how it ebbs away!
As oft the chamber, where some haunted page
Renews a poet, or revives a sage
In pensive Athens, or sublimer Rome,
To mental quiet woos the spirit home,
There stillness reigns,—how eloquently deep!
And soundless air, more beautiful than sleep.
Let winter away,—her dream-like sounds inspire
The billowy murmur of a blinding fire!
The hail-drop, hissing, it melts away
In twinkling gleams of momentary play;
Or wave-like swell of some retreated wind
In dying sadness echo'd o'er the mind,—
But gently ruffles into varied thought
The calm of feeling blissful night has brought.
How eyes the spirit with contented gaze
The chamber mellow'd into social ease,
And smiling walls, where rank'd in solemn rows
The wizard volumes of the mind repose!
Thus, well may hours like fairy waters glide,
Till morning glimmers o'er their reckless tide;
While dreams, beyond the realm of day to view,
Around us hover in seraphic hue;
Till nature pines for intellectual rest,—
When hope awakens, and the heart is blest:
Or, from the window reads our wand'ring eye
The starry language of Chaldean sky;
And gathers in that one vast gaze above,
A bright eternity of awe and love!"

This is genuine poetry, and will convince the reader that, in spite of the imperfections of *Oxford*, there is still abundant reason to hope that we shall again meet its author on more congenial ground. And we will augment the evidence.

"There is a shadow round the holy dead;
A mystery, wherein we seem to tread;
As oft their lineaments of life awake,
And sorrowing thoughts their hallow'd semblance take,

What once they dreamt, when mortal nature threw
Phantasmal dimness round their soaring view,
Now all unearth'd, bestifed, and free
From toil and tears,—the unscaled eye can see:
No more on them, the fitful whirl of things
From joy to gloom, eternal trial brings:
Array'd in light, before the throne they shine,
And fathom mysteries of love divine.
Why tears were shed, why pangs of woe prevailed,
Why goodness mourn'd, and virtue often fall'd,—
No longer now a with'ring shadow throws,
Like that which hovers round the world's repose."

We can only refer to a visit to Blenheim, page 71, as a delightful example of descriptive poetry and goodness of heart; and, by way of variety, will end with a rather animated scene of college dissipation.

"But who can languish through a hideous hour
When heart is dead, and only wine hath pow'r?
That brainless meeting of congenial tools,
Whose highest wisdom is to hate the schools,
Discuss a tandem, or describe a race,
And damn the proctor with a solemn face,
Swear nonsense wit, and intellect a sin,
Loll o'er the wine, and asininely grin!
Hard is the doom when awkward chance decoys
A moment's homage to their brutal joys.
What fogs of dulness fill the heated room,
Bedim'd with smoke, and poison'd with perfume,
Where now and then some rattling soul awakes
In oaths of thunder, till the chamber shakes!
Then midnight comes, intoxicating maid,
What heroes snore, beneath the table laid!
But, still reserved, to upright posture true,
Behold! how stately are the sterling few
Soon o'er their sudden nature wine prevails,
Decanters triumph, and the drunkard falls.
As weary tapers at some wondrous rout,
Their strength departed, winkingly go out,
Each spirit flickers till its light is o'er,
And all is darkness that was drunk before!"

The last line is not very intelligible; but we will save it by another pithy one:

"All men are vain, yet all hate vanity."

There is, however, much sense in concealing vanity; and we rather fear that, with so many enemies as have beset the early career of Montgomery, he will have exposed himself to their malice by the want of this prudent art in the volume before us. He has indeed laid himself very open to them; but yet we trust justice will also be done to his merits by an impartial and generous public.

The Premier. 3 vols. 12mo. London, 1831. Colburn and Bentley.

THIS is the third novel to which Mr. Canning has lent the magic of a name. In *De Vere* an animated and beautiful sketch was given of the noble feelings, the high and lofty mind, the patriotic energy, of the gifted original. *Sydenham* followed in the same track; and the fine and spirited portrait under the name of Anstruther was one of the most favourable specimens of its youthful author's talents. The present is as poor an imitation as it is a contemptible failure. There is a meagre outline of well-known events, better given, a hundred times, in any daily newspaper; and public men are dragged in to have some common and hearsay edition given of their characters—sketches as entirely without originality as they are without power. Why this should be called the *Premier*, we really wonder: the so-called political part barely fills the third of a volume; the rest is eked by pseudo-literary portraits, in which, calling Mr. A. A. Watts Mr. A. A. Potts (which we gather from a blunder, where the real name is printed in one place instead of the fictitious one!) is the most brilliant effort at wit we can discover; while the remaining pages are filled with a love-story so peculiarly absurd, that we shall give the outline as a curiosity. Caroline Asper is in love with, and loved by, Charles Ardent: with family and fortune equally suitable, there seems not an obstacle in the way of their union. The gentleman, however, desires a little mystery (entirely on the

writer's account), and wishes the engagement to be kept secret: a Mr. Spencer in the meantime makes Caroline an offer, which is approved by her father; and instead of the fair lady candidly avowing that her affections are engaged (we believe that is the phrase proper on such occasions), the parent is kept in complete ignorance, while the lover supposes indifference is his only obstacle, and *that* time and attention he hopes will vanquish. The day before the marriage, she elopes from home, under the protection of Sir George Ardent, the father of her lover, who is unacquainted with her engagement, but whom she talks and cries into an acquiescence with her plan: strict secrecy is to be preserved towards his wife and daughter, why we cannot understand, except on that author's plea, the "stern necessity" of a little unnecessary embarrassment. They meet in some fields, and Sir George places the fugitive in lodgings with a woman of whom he knows nothing: there she remains a fortnight, while her protector visits her every day, under the name of Mr. Howard. Scandalous insinuations get about, especially in the Sunday papers (a class to which our author seems to have a most special antipathy). Her retreat is discovered; she returns home, and is forgiven. But the most ridiculous part yet remains. Charles Ardent, to veil, as he calls it, "a father's crime," avows to Colonel Asper, (the brother of his Caroline, who visits him to explain,) that he is himself the seducer, nay, writes and signs a paper to that effect. The colonel, instead of explaining, as a word would have done, is bitten with the same mystery-mania as the rest, and affects to challenge Charles. A meeting takes place; but, on the ground, Charles finds his father, and every thing is satisfactorily settled. Unfortunately, this happens at the beginning of the third volume, and, in order to complete the remaining three hundred pages, General Asper takes into his head (to use the writer's own words) "one of the most perverse fancies that ever addled the wholesome thoughts of a human brain." He says he has been imposed upon, and forbids the alliances that were agreed to between the families. Sir George is affronted also. Miss Ardent dies, which brings the elderly gentlemen to their senses; and Charles and Caroline are married at last. What connexion this silly story has with the title of the book, we have not been able to discover. Most of the scenes are, as we have said before, repetitions of the trash of newspapers. The following one is a specimen of the author's original powers: of its grandiloquent absurdity let our readers judge. We should mention that Mr. Cranstoun is travelling with his secretary, and their carriage breaks down.

"Frederick was curiously perplexed at this moment. He could not venture to congratulate Cranstoun upon the vicinity of the Red Lion, for it was beyond the range of his possible conceptions to picture a cabinet minister walking into it for a rest, like a tired pedlar. Added to this, there was the still greater perplexity, *would* he walk into it? 'Well,' said Cranstoun, taking hold of his secretary's arm, while he supported his steps with a stick in his other hand, 'here is a house.' 'Yes, sir—there is a house,' replied Frederick hesitatingly. 'The Red Lion,' continued Cranstoun, looking at the sign; 'and, upon my word, as spruce and gentlemanly a lion as I would wish to see, with clean nails and a copper-coloured tail.' Frederick laughed; but still thought of the tale which hung at the end of his own reflections—*would* one of his majesty's minis-

ters call at the Red Lion? and if he did, what would he call for when there? • • • 'By heavens!' exclaimed Frederick to himself, 'we are going to the Red Lion!' and he was at least as much pleased as surprised at the novelty of the thing. • • • The scene that followed, when, the next moment, Mr. Owen Tudor, with a sort of half bow, between a nod and a complete obeisance, still smirking, still rubbing his hands, and advancing a step nearer at each movement of his head, inquired, 'What they would be pleased to take?' might have exercised the pencil of Hogarth in its most inspired touches. Frederick bit his lip violently, to restrain the laugh with which he was bursting. Cranstoun drew his hand across his mouth, and for the first time in his life found himself embarrassed at a reply. Mr. Owen Tudor, with a view to assist them in their choice, recounted volubly the treasures of his cellar. 'I have some prime Herefordshire cider in bottle, and capital perry—capital, I assure you; excellent draught ale, superior stout, and better London porter than is to be got in London itself: I am choice in my spirits, too. You will find the ale very good, gentlemen, if you try it; it is my friend Owen's own brewing; and a purer ale, I'll venture to say, is not to be drunk in this or any other county.' 'Well then,' said Cranstoun, suiting his manner to the occasion, 'let it be ale; and the landlord departed to obey the order. • • • 'Shall I not take mine ease in mine inn?' said Cranstoun in a half-whisper to Frederick; accompanying the words with an indescribable look of arch drollery, as he drew towards him a vacant chair on which he stretched his legs. Frederick could only smile. At no time did the urbane kindness of Cranstoun betray him into familiarity with him; and at the present moment they were oddly situated that he feared to speak, lest he should cause some awkward embarrassment, especially as there had been no opportunity for Cranstoun to express his own view of their situation."

There is something, to be sure, very much out of the course of nature that a minister and his secretary should stop at a little country inn. But to conclude—a catchpenny title, an uninteresting and ridiculous story, personality without individuality (for truly the portraits require their names to be written under them), inelegance of language, and common-place observation—such is the trash that has been ushered with a prodigious flourish of trumpets into public notice. Mr. Colburn undeniably publishes almost all our best novels: we put it to himself, how he injures the fair fame of those who so richly deserve praise, as well as the general interests of literature, by injudicious and extravagant puffing of works like the present.

Journal of Travels in the Seat of War between Russia and Turkey. By T. B. Armstrong. 8vo. pp. 242. London, 1831. Seguin.

THIS volume comprises a very rapid journey over various countries, written, as the author (who travelled, as we gather, in the useful capacity of a courier) observes, "with little pretensions to elegance or correctness of style." He enjoyed highly, and often describes forcibly, what he saw. After leaving Vienna, the first passage of any interest, much increased by late events, is the following:—

"We had now a splendid and extensive view of Cracow and the surrounding country, with the city conspicuously perched on the river Vistula before us. We crossed the

bridge of boats; and on the other side of the river were immediately assailed by numbers of Jews, anxious to serve us in exchanging money, or offering horses for hire. We were some time in traversing the very irregular streets of this singular old town. About eight miles from Cracow we arrived at the little village of Wieliczka, celebrated for its salt mines. With permission of the governor, we proceeded next day to a large building in the centre of the village, and entered a small room, where from ten to fifteen men were in attendance, with lighted lamps, to conduct us below. The descent was by winding stairs: the first object that attracted my attention was six horses at work in another machine, dragging up immense blocks of salt; I was told they had not seen daylight for near fifteen years; I found their coats to be as smooth as any English hunters; and they were in as good condition as possible. We visited several chambers cut in the rock; the chapel, in particular, presented a dazzling and singular effect as we approached it with our lamps: the several statues are very well executed, and appear transparent. On the first stage hence, the Vistula winding majestically on our left, through a most delightful country: the villages proved wretched in the extreme, and nothing was to be met with but filth and poverty."

The traveller at last approaches Odessa, over one of the weary steppes of Russia.

"I looked for trees or houses, but found none: the road is according to the fancy of the traveller: it was an ocean of waste. The troops we had passed this morning came to a halt: on inquiring of three officers how long they had been on their route, I was astonished on their answering,—'Eleven weeks, continually.' We next arrived on the ridge of a steppe that continues for fifty versts to Teraspol. Previous to arriving, we witnessed a cloud of locusts: we had to encounter them as they flew over the plain by millions. I took one of them; it measured three inches long, and was two inches broad from the points of the wings. They had devoured every article of vegetation that fell in their way; whole fields of corn were devastated in a few days."

The people of Arabia, whom this scourge still infests, are more fortunate than the natives of the Crimea, inasmuch as they have little verdure to be destroyed, save a few groves of palm. The difference of reception given to these "living clouds" in the two countries is singular enough: the Arabs receive them rather as a blessing—catch them eagerly, fry them in butter, or, in default thereof, eat them almost on the wing, or dry and lay them up as a *bonne bouche*. We remember, one day halting in a stunted group of palms on the banks of the Red Sea, being assailed by these locusts, who dropped from the trees, or came slowly through the hot air, and quietly settled on us, to the great glee of our Arab escort, who, pulling off the wings and heads, devoured them as if they had been so many shrimps. "But the people of these parts," says Mr. Armstrong, "collect with shovels, pans, fire-arms, &c., keeping up a horrible noise, advancing in a line as the locusts retreat, which are thus frequently driven from the lands to seek an asylum in the bosom of the deep."

The author describes an appearance on these endless plains of the same kind as observed in the eastern deserts, though from a different cause. "During the day, I witnessed a curious phenomenon, which frequently takes place on

the steppes of Russia, and is called mirage: the vapour from the earth, acted upon by the power of the sun, rises and appears to take whatever object may be before you: its general appearance is that of a lake, with islands, houses, or trees: it recedes as the traveller advances."

On arriving near Varna, he thus describes the present Emperor of Russia:—"After waiting some time in the court-yard of the palace, I was gratified with a sight of the czar as he entered his carriage. He is a tall, handsome, soldier-like personage, with a fine manly countenance, possessing an air *degagé*. He was dressed in the plainest manner, in a dark green double-breasted frock, with red collar and cuffs—a cap of the same cloth, with red band—and a gray military cloak thrown loosely over him. All eyes were anxiously fixed on him whose appearance was to determine the fate of Varna: he saluted his officers severally in an affable manner."

The evil complained of by almost every traveller, is the unhappy sameness of the modern routes: from Paris to Naples, all is so perfectly familiar, that one knows almost the exact scene, whether of mountain, valley, or water-fall, which each day is to present, nearly as well as the good or bad dinners of the inns. Variety, endless variety, is the order of Mr. A.'s journey.

"The last post," he says, "produced a complete change of scenery; we got into a deep valley, covered with cottages and trees, and watered by a clear stream: how welcome and how cheering, after the dreary parched steppe! At last we came to Simpherpoole: the weekly market held here is really interesting to those who enjoy novelty of costume and odd equipages. Here you will meet the German driving a pair of oxen, with a horse as leader; Tartar carts, drawn by dromedaries; and horsemen covered with Circassian bourkas. I actually saw a French doctor, in ill health, leave the place for Theodosia in a *light phaeton*, drawn by a pair of immense camels. On the way from Soudak we passed several burial-places of the Tartars, in one of which I noticed several women, covered with white robes, preparing to inter a body."

Another description is equally novel:—"The Georgian or Tartar dwellings are seldom to be found above ground: the top is covered with beams of wood, branches of trees, and, above all, with a coat of earth, which makes it level with the ground. The natives are frequently disturbed, when sitting round the fire, by the leg of some unfortunate cow or camel making its appearance down the chimney; and it is not uncommon for the lambs to fall through, and spoil whatever may happen to be cooking."

On arriving at Erivan, the scenery was of more lofty character: it is a pity that the traveller could not afford more time to the really interesting places he saw; as it is, he makes the best use of his hurried visits.

"I chose a fine clear frosty morning, and enjoyed a sublime view of the great and little Ararat: both the summits were covered with snow: no one, as yet, has succeeded in attaining the top of either. Several extensive glaciers fill up the ravines, immediately under one of which is an hermitage, about half-way down the mountain, which the natives affirm to have been the habitation of Noah after the flood. Lions, bears, hyenas, and rock-snakes, are said to infest this mountain. About 5 p.m. the snow fell so thick as to darken the air: we wandered about the vicinity of the moun-

tains, when we all at once found ourselves on the brink of a precipice, hanging over a roaring torrent. We at last arrived at some ruins, where we mistook a tombstone for a door, and came at length to an old ruined church, full of sheep: we slept in wet clothes on the damp floor."

From Georgia Mr. Armstrong proceeds into Persia, has an audience of the Shah at Tehran, is wearied with the miserable condition of the people, and with fears of the Koords. Among the few fine scenes of this sultry and unpicturesque land is the following.

"At sunset we had a delightful and extensive view of the lake of Ouroumiâ and the mountains on its left. We arrived at the neat town of Tasse; its environs form a complete garden, irrigation being carried on here, as indeed in most parts of Persia, very successfully. The circumference of the lake of Ouroumiâ is 250 miles, its length from north to south 90, and breadth 32—the scenery most beautiful. In the centre of this immense lake are several singular-formed islands; and the mountains of Kurdistan bound the prospect. Its waters, we were told, are so salt that no fish can live in it."

To enter Armenia appeared like a passage into a land of promise. If this country is as he represents—and his descriptions bear the stamp of fidelity and truth—it were well for the lovers of travel, now that revolutions make, or soon will make, the continent a forbidden land to them, to turn their steps towards Armenia—a splendid climate, a friendly and often polished people, with here and there a welcome which one could picture rather in the Highlands of Scotland than in those of the Caucasus: let Mr. A. describe:—

"For one hour we were surrounded with snow, and at another travelling through beautiful groves of trees, with the Araxes at some distance below us: in five hours we came to the advanced part of the immense caravan we had met in the morning. On descending, we arrived at a neat village, on the borders of an immense plain, where, on a grassplot in front of their dwellings, we observed a few Mussulmen at their devotions, kneeling silently. We at last arrived at the well-situated city of Arzeroom. I counted thirty minarets and other towers rising from the bosom of this ancient capital of Armenia. Tiles are used for roofing, which gives the buildings a European appearance; and the form of the houses much resembles the Swiss cottages. * * * This morning we travelled seven hours, and are now in the Sheitan Dura (Devil's Valley); and the heaps of stone we sat on during our refreshment were the tombs of victims, they said, who had been murdered by banditti in this terrific pass. The scenery and the images which the tales of our guides conjured up, made it a valley of horror; and we sharpened our pace. But the next day we were surrounded by the grandest scenery on every side—bold and fertile valleys, watered by mountain streams; rich plains of pasturage, covered with flowers, emitting the most fragrant perfume; the corn-fields looked green and fresh: while the summits of the lofty mountains were covered with snow, their sides were often clothed with forests. * * *

We next day traversed the most picturesque valley I ever beheld, covered with the summer residences of the neighbouring gentry. On our right were rocky conical mountains of gigantic height—the town of Kara Hisar, or Black Castle, on one of their summits."

The only defect in this goodly land seems to be the want of inns—a lonely caravansary is

but a poor substitute, with bare floors and comfortless walls; and exquisite scenery, when long continued, having a strong tendency to excite the appetite, the recoil from the joys of the imagination to the keen and cruel demands of hunger is extreme. We remember travelling with a countryman in Switzerland, who had no passion for cold and snowy magnificence; wearied utterly also with a long day's progress, it was in vain that the sun was going down in excessive glory on Mont Blanc and its neighbouring glaciers. "Look!" exclaimed one enthusiast, "the purple rays are full on its crest and side, after they have fled from every other peak." "Beautiful!" exclaimed every one except W——, who sat sadly on a bank during the pause. "Purple light, and glaciers, and glory, what are they all at this moment compared to a roast pig, well crisped, laid on the rock before us, and the last ray resting on its back?" Mr. A. thus feelingly speaks of a similar train of feeling:—"An old castle is on the summit of a rocky height. We looked with admiration on the loveliest spot in nature, high amongst the mountains, hid from the noisy world, remote in nature's very bosom, enjoying almost every fruit common in Asia. Soon after, we entered a forest, in which we were benighted, and the rain fell in torrents. Our Tartars at last discovered a village: here we were hospitably received in the house of a gentleman; a good fire blazed in the apartment, and every thing to make us comfortable was provided. What a transition from the majestic pine forests and solitudes! Our host with some friends enjoyed themselves, as we all did. After partaking of a good and plentiful repast, we slept soundly."

One could almost envy a residence in Tokat, famed for its wines. "In approaching it, the roads are for two miles ornamented on each side with gardens, the perfume from which is most delicious, and the nightingale warbling its sweet song, the only sound to be heard in the calm stillness of the night. We next passed the beautiful remains of the once-famed Amasia. The reflection of the moon on the ancient castle was striking. The city is placed amidst an amphitheatre of mountains, and watered by a fine river. At the top of a perpendicular rock are the remains of a noble Genoese castle. In the centre of the city, and close on the river, is a superb mosque, with a gilded dome and minarets, rising splendidly from amidst the remains of Genoese art. Quantities of mills are seen on the banks of the river, throwing water into the gardens which surround the town."

Whatever faults of style, and they are very many, attach to Mr. A. as a writer, he has had the good sense to produce his travels in a plain and unassuming form. His volume has much interest: had he tarried longer on the way, and not counted every moment lost in which he was not *en route*, or possessed a more able and elegant pen, few journeys of the day would have been so attractive.

Beechey's Voyage to the Pacific.

[Second Notice.]

FROM Gambier's Islands, Captain Beechey pursued his course, and examined a number of the eastern Polynesian Islands, with which the Pacific is studded, and of which many, no doubt, yet remain to be discovered, as they are indeed discovered by every vessel which shapes a new track through that immense ocean. At the close, he tells us:—

"Of the thirty-two islands which have thus been visited in succession, only twelve are in-

habited, including Pitcairn Island; and the amount of the population altogether cannot possibly exceed three thousand one hundred souls; of which one thousand belong to the Gambier group, and twelve hundred and sixty to Easter Island, leaving eight hundred and forty persons only to occupy the other thirty islands. All the natives apparently profess the same religion; all speak the same language, and are in all essential points the same people. There is a great diversity of features and complexion between those inhabiting the volcanic islands and the natives of the coral formations, the former being a taller and fairer race. This change may be attributed to a difference of food, habits, and comfort; the one having to seek a daily subsistence upon the reefs, exposed to a burning sun and to the painful glare of a white coral beach, while the other enjoys plentifully the spontaneous produce of the earth, reposes beneath the genial shade of palm or bread-fruit groves, and passes a life of comparative ease and luxury. It has hitherto been a matter of conjecture how these islands, so remote from both great continents, have received their aborigines. The intimate connexion between the language, worship, manners, customs, and traditions, of the people who dwell upon them, and those of the Malays and other inhabitants of the great islands to the westward, leaves no doubt of frequent emigrations from thence; and we naturally look to those countries as the source from which they have sprung. The difficulty, however, instantly presents itself of proceeding so vast a distance in opposition to the prevailing wind and current, without vessels better equipped than those which are in possession of those people. This objection is so powerful in the minds of some authors, that they have had recourse to the circuitous route through Tartary, across Beering's Strait, and over the American continent, to bring them to a situation whence they might be drifted by the ordinary course of the winds to the lands in question. But had this been the case, a more intimate resemblance would surely be found to exist between the American Indians and the natives of Polynesia."

In our opinion, but we put it with great diffidence, the Polynesian Islands have been peopled both from the Asian and American continents—the nearest to each, from each. If we are rightly informed, there is a marked difference in the physical form, features, hair, &c., between the natives of the islands nearest America and those nearest Asia, as well as in their habits, costume, rites, and language. But the discussion of this question would lead us into too great length; and we rather quote a canoe adventure of much interest, which will shew how accident might contribute to the peopling of island after island. At Byam Martin Island, 600 miles from Otaheite, Captain B. found forty persons, who had been driven thither by storm and stress of weather, and brought one of them, named Tuwarri, off with him, to carry the news home.

"Tuwarri was a native of one of the low coral formations discovered by Capt. Cook in his first voyage, called Anaa by the natives, but by him named Chain Island, situated about three hundred miles to the eastward of Otaheite, to which it is tributary. About the period of the commencement of his misfortunes, old Pomarree, the king of Otaheite, died, and was succeeded by his son, then a child. On the accession of this boy, several chiefs and commoners of Chain Island, among whom was Tuwarri, planned a voyage to Otaheite, to pay

a visit of ceremony and of homage to their new sovereign. The only conveyance these people could command was double canoes, three of which, of the largest class, were prepared for the occasion. To us, accustomed to navigate the seas in ships of many tons burthen, provided with a compass and the necessary instruments to determine our position,—a canoe with only the stars for her guidance, and destined to a place whose situation could be at the best but approximately known, appears so frail and uncertain a conveyance, that we may wonder how any persons could be found sufficiently resolute to hazard the undertaking. They knew, however, that similar voyages had been successfully performed, not only to mountainous islands to leeward, but to some that were scarcely six feet above the water, and were situated in the opposite direction; and as no ill omens attended the present undertaking, no unusual fears were entertained. The canoes being accordingly prepared, and duly furnished with all that was considered necessary, the persons intending to proceed on this expedition were embarked, amounting in all to a hundred and fifty souls. What was the arrangement of the other two canoes is unknown to us; but in Tuwarri's there were twenty-three men, fifteen women, and ten children, and a supply of water and provision calculated to last three weeks. On the day of departure all the natives assembled upon the beach to take leave of our adventurers; the canoes were placed with scrupulous exactness in the supposed direction, which was indicated by certain marks upon the land, and then launched into the sea, amidst the good wishes and adieus of their countrymen. With a fair wind and full sail they glided rapidly over the space, without a thought of the possibility of the miseries to which they were afterwards exposed. It happened, unfortunately, that the monsoon that year began earlier than was expected, and blew with great violence; two days were, notwithstanding, passed under favourable circumstances, and the adventurers began to look for the high land of Maitea, an island between Chain Island and Otaheite, and to anticipate the pleasures which the successful termination of their voyage would afford them; when their progress was delayed by a calm, the precursor of a storm, which rose suddenly from an unfavourable quarter, dispersed the canoes, and drove them away before it. In this manner they drifted for several days; but on the return of fine weather, having a fortnight's provision remaining, they again resolutely sought their destination; but a second gale drove them still further back than the first, and lasted so long, that they became exhausted. Thus many days were past; their distance from home hourly increasing; the sea continually washing over the canoe, to the great discomfiture of the women and children; and their store of provision dwindled to the last extremity. A long calm, and, what was to them even worse, hot dry weather, succeeded the tempest, and drove them to a state of despair. From the description, we may imagine their canoe alone and becalmed on the ocean; the crew, perishing with thirst, beneath the fierce glare of a tropical sun, hanging exhausted over their paddles; children looking to their parents for support, and mothers deploring their inability to afford them assistance. Every means of quenching their thirst were resorted to; some drank the sea-water, and others bathed in it, or poured it over their heads; but the absence of fresh water in the torrid zone cannot be

compensated by such substitutes. Day after day, those who were able extended their guards to heaven in supplication for rain, and repeated their prayers—but in vain; the fleecy cloud floating high in the air indicated only an extension of their suffering; distress in its most aggravated form had at length reached its height, and seventeen persons fell victims to its horrors. The situation of those who remained may readily be imagined, though their fate would never have been known to us, had not Providence at this critical moment wrought a change in their favour. The sky, which for some time had been perfectly serene, assumed an aspect which at any other period would have filled our sufferers with apprehension; but, on the present occasion, the tropical storm, as it approached, was hailed with thankfulness, and welcomed as their deliverer. All who were able came upon the deck with blankets, gourds, and cocoa-nut shells, and extended them toward the black cloud, as it approached, pouring down torrents of rain, of which every drop was of incalculable value to the sufferers; they drank copiously and thankfully, and filled every vessel with the precious element. Thus recruited, hope revived; but the absence of food again plunged them into the deepest despair. We need not relate the dreadful alternative to which they had recourse until several large sharks rose to the surface and followed the canoe; Tuwarri, by breaking off the head of an iron scraper, formed it into a hook, and succeeding in catching one of them, which was instantly substituted for the revolting banquet which had hitherto sustained life. Thus refreshed, they again worked at their paddles or spread their sail, and were not long before their exertions were repaid with the joyful sight of land, on which clusters of cocoa-nuts crowned the heads of several tufts of palm-trees: they hurried through the surf, and soon reached the much-wished-for spot, but being too feeble to ascend the luffy trees, were obliged to fell one of them with an axe. On traversing the island to which Providence had thus conducted them, they discovered by several canoes in the lagoon, and pathways intersecting the woods, that it had been previously inhabited; and knowing the greater part of the natives of the low islands to be cannibals, they determined to remain no longer upon it than was absolutely necessary to recruit their strength, imagining that the islanders, when they did return, would not rest satisfied with merely dispossessing them of their asylum. It was necessary, while they were allowed to remain, to seek shelter from the weather, and to exert themselves in procuring a supply of provision for their further voyage; houses were consequently built, pools dug for water, and three canoes added to those which were found in the lake. Their situation by these means was rendered tolerably comfortable, and they not only provided themselves with necessaries sufficient for daily consumption, but were able to dry and lay by a considerable quantity of fish for sea stock. After a time, finding themselves undisturbed, they gained confidence, and deferred their departure till thirteen months had elapsed from the time of their landing. At the expiration of which period, being in good bodily health and supplied with necessaries for their voyage, they again launched upon the ocean in quest of home. They steered two days and nights to the north west, and then fell in with a small island, upon which, as it appeared to be uninhabited, they landed, and remained three days, and then resumed their voyage. After a run of a day and a night

they came in sight of another uninhabited island. In their attempt to land upon it, their canoe was unfortunately stove, but all the party got safe on shore. The damage which the vessel had sustained requiring several weeks to repair, they established themselves upon this island, and again commenced storing up provision for their voyage. Eight months had already passed in these occupations, when we unexpectedly found them thus encamped upon Byam Martin Island, with their canoe repaired, and all the necessary stores provided for their next expedition. The other two canoes were never heard of."

Capt. B. having landed Tuwarri on Chain Island, sailed to Bow Island, of which his account is curious.

"The natives were in appearance the most indolent ill-looking race we had yet seen; broad flat noses, dull sunken eyes, thick lips, mouths turned down at the corners, strongly wrinkled countenances, and long bushy hair matted with dirt and vermin. Their stature was above the middle size, but generally crooked; their limbs bony, their muscles flaccid, and their only covering a maro. But hideous as the men were, their revolting appearance was surpassed by the opposite sex of the same age. The males were all lolling against the cocoa-nut trees, with their arms round each others' necks, enjoying the refreshing shade of a thick foliage of palm-trees; while the women, old and young, were labouring hard in the sun, in the service of their masters, for they did not merit the name of husbands. The children, quite naked, were placed upon mats, crying and rolling to and fro, to displace some of the myriads of house-flies, which so speckled their bodies that their real colour was scarcely discernible."

"On questioning the chief, he acknowledged himself to have been present at several feasts of human bodies, and on expatiating on the excellence of the food, particularly when it was that of a female, his brutal countenance became flushed with a horrible expression of animation. Their enemies, those slain in battle, or those who die violent deaths, and murderers, were, he said, the only subjects selected for these feasts: the latter, whether justified or not, were put to death, and eaten alike with their victims. They have still a great partiality for raw food, which is but one remove from cannibalism; and when a canoe full of fish was brought one day to the village, the men, before it could be drawn to the shore, fell upon its contents, and devoured every part of the fish except the bones and fins. The women, whose business it was to unload the boat, did the best they could with one of them between their teeth, while their hands were employed portioning the contents of the canoe into small heaps. But even in this repast we were glad to observe some indication of feeling by their putting the animal speedily out of torture by biting its head in two, the only proof of humanity which they manifested. In like manner, cleanliness was not overlooked by them, for they carefully rinsed their mouths after the disgusting meal. It appeared that the chief had three wives, and that polygamy was permitted to an unlimited extent; any man of the community, we were told, might put away his wife whenever it is his pleasure to do so, and take another, provided she were disengaged. No ceremony takes place at the wedding; it being sufficient for a man to say to a woman, 'You shall be my wife;' and she becomes so. The offspring of these unions seem to be the objects of the only feelings of

affection the male sex possess, as there was certainly none bestowed on the women. Indeed the situation of the females is much to be pitied: in no part of the world, probably, are they treated more brutally. While their husbands are indulging their lethargic disposition under the shade of the cocoa-nut trees, making no effort toward their own support, beyond that of eating when their food is placed before them, the women are sent to the reefs to wade over the sharp-pointed coral in search of shell-fish, or to the woods to collect pandanus-nuts. We have seen them going out at daylight on these pursuits, and returning quite fatigued with their morning toil. In this state, instead of enjoying a little repose on reaching their home, they are engaged in the laborious occupation of preparing what they have gathered for their hungry masters, who, immediately the nuts are placed before them, stay their appetites by extracting the pulpy substance contained in the outside woody fibres of the fruit, and throw the remainder to their wives, who further extract what is left of the pulp for their own share, and proceed to extricate the contents of the interior, consisting of four or five small kernels about the size of an almond. To perform this operation, the nut is placed upon a flat stone endwise, and with a block of coral, as large as the strength of the women will enable them to lift, is split in pieces, and the contents again put aside for their husbands. As it requires a considerable number of these small nuts to satisfy the appetites of their hungry masters, the time of the women is wholly passed upon their knees pounding nuts, or upon the sharp coral collecting shells and sea-eggs. On some occasions the nuts are baked in the ground, which gives them a more agreeable flavour, and facilitates the extraction of the pulp; it does not, however, diminish the labour of the females, who have in either case to bruise the fibres to procure the smaller nuts. The superiority of sex was never more rigidly enforced than among these barbarians, nor were the male part of the human species ever more despicable. On one occasion, an unfortunate woman who was pounding some of these nuts, which she had walked a great distance to gather, thinking herself unobserved, ate two or three of the kernels as she extracted them; but this did not escape the vigilance of her brutal husband, who instantly rose and felled her to the ground in the most inhuman manner with three violent blows of his fist. Thus tyrannised over, debased, neglected by the male sex, and strangers to social affection, it is no wonder all those qualities which in civilised countries constitute the fascination of woman, are in these people wholly wanting."

[To be concluded in our next.]

Col. Napier's War in the Peninsula.

(Second notice: Conclusion.)

INDEPENDENTLY of the military incidents, on which the author is so delightfully diffuse, his volumes have a further claim to attention, inasmuch as they furnish many authentic illustrations of the habitual public bearing and temper of the Duke of Wellington, tending to confirm us in our opinion of the confined direction and limited application of his high powers of mind. Military chiefs have, with few exceptions, made but indifferent statesmen; and never, perhaps, popular ones in a country blessed with free institutions. The boy's first lesson, on obtaining his colours, is to learn submission to the arbitrary will of those above him, and to require the like from those beneath; the pride of this petty away compen-

sates for a time the harsh sway of superiors; but, shortly, sated with the novelty of the first toy, he pants for nobler game, and aspires to climb ambition's ladder: every step he mounts, he gains fresh confidence. The constant habits of command, and the frequency of sole responsibility, render him often dogmatical in opinion, and a foe to genius, unless mingled with subservience—martial law, of which he becomes a dispenser, is regarded as the most perfect of practical codes—in correspondence he is dictatorial—in society his manners are agreeable, though frequently approaching to *brusquerie*—in argument his opinions are delivered as axioms—and his mind becomes as it were dyed with the despotic nature of his calling.

The Duke of Wellington is, perhaps, the readiest example we have at hand: much of his early career was spent amid the "trampled fields of Indostan," at a period when a thirst for conquest, stimulated by the hope of booty, was a principle prevailing with but too many; the daily facility with which almost countless hosts were overthrown, and extensive territories acquired, by the disciplined few, must have caused him to look upon his profession as the all-important one, and have attracted to it all the energies of his youthful mind. The influence thus gained was never chilled by ill success; but being continually fostered by fortune, it became the ruling principle. His letters at various epochs, whether on the subject of the East, or addressed to the Portuguese Regency, are all in a like arbitrary tone of command; every where bespeaking the consummate soldier, yet affording but little indication of the future statesman. The power of force is admirably developed; but we look in vain for the peaceful charm of persuasion. Moreover, we here behold him with the reins of government in his hands. His first step was to disembarass himself from the inconvenience of having men about him who had any genius either to suggest, or independence to disapprove. Many influential departments were filled with his military subordinates, whose devotion to their chief was as unbounded as their confidence was unlimited—the usages of the camp became those of the cabinet—all things were regarded through a military *coup-d'œil*—and the elements of strategy and simulation were arrayed, to veil from his adversaries the general's intended movements in the political combat. But this could not last. The sequel is too well known for us to continue; and we therefore gladly quit the field of politics, for other scenes, where the gallant author has already reaped glorious honour; and which have still rewards, we trust, in store for him of a more substantial nature. We cull from the garland of brilliant exploits, achieved by the dashing light division, and its chivalric commander Crawford, the following vivid description of the combat of the Coa.

"Crawford's whole force under arms consisted of four thousand infantry, eleven hundred cavalry, and six guns; and his position, one mile and a half in length, extended in an oblique line towards the Coa. The cavalry piquets were upon the plain in his front, his right on some broken ground, and his left, resting on an unfinished tower, eight hundred yards from Almeida, was defended by the guns of that fortress; but his back was on the edge of the ravine forming the channel of the Coa, and the bridge was more than a mile distant, in the bottom of the chasm. A stormy night ushered in the 24th of July. The troops, drenched with rain, were under arms before day-light, expecting to retire, when a few

pistol-shots in front, followed by an order for the cavalry reserves and the guns to advance, gave notice of the enemy's approach; and as the morning cleared, twenty-four thousand French infantry, five thousand cavalry, and thirty pieces of artillery, were observed marching beyond the Turones. The British line was immediately contracted and brought under the edge of the ravine; but meanwhile Ney, who had observed Crawford's false disposition, came down with the stoop of an eagle. Four thousand horsemen and a powerful artillery swept the plain. The allied cavalry gave back, and Loison's division coming up at a charging pace, made towards the centre and left of the position. While the French were thus pouring onward, several ill-judged changes were made on the English side, part of the troops were advanced, others drawn back, and the forty-third most unaccountably placed within an enclosure of solid masonry, at least ten feet high, situated on the left of the road with but one narrow outlet about half-musket shot down the ravine. While thus imprisoned, the firing in front redoubled, the cavalry, the artillery, and the *caçadores*, successively passed by in retreat, and the sharp clang of the ninety-fifth rifle was heard along the edge of the plain above. A few moments later, and the forty-third would have been surrounded; but that here, as in every other part of this field, the quickness and knowledge of the battalion officers remedied the faults of the general. One minute sufficed to loosen some large stones, a powerful effort burst the enclosure, and the regiment, reformed in column of companies, was the next instant up with the riflemen: there was no room to array the line, no time for any thing but battle, every captain carried off his company as an independent body, and joining as he could with the ninety-fifth or fifty-second, the whole presented a mass of skirmishers, acting in small parties and under no regular command; yet each confident in the courage and discipline of those on his right and left, and all regulating their movements by a common discretion, and keeping together with surprising vigour. It is unnecessary to describe the first burst of French soldiers. It is well known with what gallantry the officers lead, with what vehemence the troops follow, and with what a storm of fire they waste a field of battle. At this moment, with the advantage of ground and numbers, they were breaking over the edge of the ravine, their guns ranged along the summit, played hotly with grape; and their hussars, galloping over the glacis of Almeida, poured down the road, sabring every thing in their way. Ney, desirous that Montbrun should follow this movement with the whole of the French cavalry, and so cut off the troops from the bridge, sent five officers in succession to urge him on; and so mixed were friends and enemies at the moment, that only a few guns of the fortress durst open, and no courage could have availed against such overwhelming numbers. But Montbrun enjoyed an independent command, and, as the attack was made without Massena's knowledge, he would not stir. Then the British regiments, with singular intelligence and discipline, extricated themselves from their perilous situation. For falling back slowly, and yet stopping and fighting whenever opportunity offered, they made their way through a rugged country tangled with vineyards, in despite of their enemies, who were so fierce and eager, that even the horsemen rode in amongst the enclosures, striking at the soldiers as they mounted the walls or scrambled over the rocks. As

the retreating troops approached the river, they came upon a more open space; but the left wing being harder pressed, and having the shortest distance, arrived while the bridge was still crowded and some of the right wing distant. Major M'Leod, of the forty-third, seeing this, rallied four companies on a hill just in front of the passage, and was immediately joined by a party of the ninety-fifth; and at the same time, two other companies were posted by brigade-major Rowan, on another hill flanking the road; these posts were thus maintained until the enemy, gathering in great numbers, made a second burst, when the companies fell back. At this moment the right wing of the fifty-second was seen marching towards the bridge, which was still crowded with the passing troops. M'Leod, a very young man, but with a natural genius for war, immediately turned his horse round, called to the troops to follow, and, taking off his cap, rode with a shout towards the enemy. The suddenness of the thing, and the distinguished action of the man, produced the effect he designed; a mob of soldiers rushed after him, cheering and charging as if a whole army had been at their backs; and the enemy's skirmishers, astonished at this unexpected movement, stopped short. Before they could recover from their surprise, the fifty-second crossed the river; and M'Leod, following at full speed, gained the other side also without a disaster. As the regiments passed the bridge, they planted themselves in loose order on the side of the mountain. The artillery drew up on the summit, and the cavalry were disposed in parties on the roads to the right, because two miles higher up the stream there were fords, and beyond them the bridge of Castello Bom; and it was to be apprehended that, while the sixth corps was in front, the reserves, and a division of the eighth corps, then on the Agueda, might pass at those places and get between the division and Celerico. The river was, however, rising fast from the rains, and it was impossible to retreat farther. The French skirmishers, swarming on the right bank, opened a biting fire, which was returned as bitterly; the artillery on both sides played across the ravine—the sounds were repeated by numberless echoes; and the smoke, rising slowly, resolved itself into an immense arch, spanning the whole chasm, and sparkling with the whirling fuzes of the flying shells. The enemy gathered fast and thickly; his columns were discovered forming behind the high rocks, and a dragon was seen to try the depth of the stream above; but two shots from the fifty-second killed horse and man; and the carcasses, floating between the hostile bands, shewed that the river was impassable. The monotonous tones of a French drum were then heard; and in another instant the head of a noble column was at the long narrow bridge. A drummer and an officer in a splendid uniform leaped forward together, and the whole rushed on with loud cries. The depth of the ravine at first deceived the soldiers' aim, and two-thirds of the passage was won ere an English shot had brought down an enemy: yet a few paces onwards the line of death was traced, and the whole of the leading French section fell as one man! Still the gallant column pressed forward—but no foot could pass that terrible line; the killed and wounded rolled together, until the heap rose nearly even with the parapet, and the living mass behind melted away, rather than gave back. The shouts of the British now rose loudly—but they were confidently answered; and, in half

an hour, a second column, more numerous than the first, again crowded the bridge. This time, however, the range was better judged; and ere half the distance was won, the multitude was again torn, shattered, dispersed, and slain; ten or twelve men only succeeded in crossing, and took shelter under the rocks at the brink of the river. The skirmishing was renewed; and a French surgeon coming down to the very foot of the bridge, waved his handkerchief, and commenced dressing the wounded under the hottest fire: nor was his appeal unheeded; every musket turned from him, although his still undaunted countrymen were preparing for a third attempt. The impossibility of forcing the passage was, however, become too apparent; and this last effort, made with feeble numbers and less energy, failed almost as soon as it commenced. Nevertheless, the combat was unnecessarily continued—by the French, as a point of honour, to cover the escape of those who had passed the bridge;—by the English, from ignorance of their object."

After noticing some other particulars, the arrival of General Picton alone from Pinhel, and his refusal to bring up the third division, the author adds: "Picton and Crawford were, however, not formed by nature to act cordially together. The stern countenance, robust frame, saturnine complexion, caustic speech, and austere demeanour of the first, promised little sympathy with the short, thick figure, dark flashing eyes, quick movements, and fiery temper of the second; nor, indeed, did they often meet without a quarrel. Nevertheless, they had many points of resemblance in their characters and fortunes. Both were inclined to harshness, and rigid in command; both prone to disobedience, yet exacting entire submission from inferiors; and they were alike ambitious and craving of glory. They both possessed decided military talents; were enterprising and intrepid; yet neither were remarkable for skill in handling troops under fire. This, also, they had in common—that both, after distinguished services, perished in arms, fighting gallantly; and being celebrated as generals of division while living, have, since their death, been injudiciously spoken of, as rivalling their great leader in war."

In conclusion, we have to remark, that the third volume is much superior to the preceding in regards composition: it is plain, precise, and elegant. Among some slight blemishes, we notice a few words, called upon, perhaps by the laws of military conscription, to fill other duties than those for which they were originally intended. The following sentence is an example:—"Previous to the invasion of Portugal, the French, stretching in one great line across the Peninsula, from Cadiz to Gihon, *scarcely discussed* the remnants of the Spanish armies." Again, speaking of the effect of artillery:—"The besieged replied, at first, sharply; but in a little time *stammered* in their careers." A better phrase might have been used than to "*disseminate* troops." There is, likewise, occasionally a resort to classic sources for metaphorical figures, such as "the bed of Procrustes," which distract the attention from the subject, and are like the attempts of the Romans to improve the Greek Doric—truly destructive to the simplicity and manliness of the style.

Nicholas Wood on Rail-Roads. New edition. 8vo. pp. 530. London, 1831. Hurst and Co.

Is this the able author has brought up his

treasure to the date of the latest improvements in the nationally important plan for conveying merchandise and passengers by rail-roads. We consider the volume to be one of great general interest; and we hope very soon to see the day when rail-roads, radiating from London in every direction, shall bring the supplies of the country from at least a circle of fifty miles, so rapidly and so safely to the metropolis, that every kind of product of the farm, the garden, the dairy, &c. &c. shall be sold to the inhabitants at a much lower price, and in a much finer and more natural condition, than at any former period. As we expressed our favourable opinion of the first edition, we need say nothing more of the present.

Egyptian Learning. Memoir of the Life of Thomas Young, M.D. F.R.S. &c. &c. 8vo. pp. circ. 200. London, 1831. J. and A. Arch.
